intertwined. The deepest roots of such contributions can be found in Greek authors, such as Aristides, Aristotle, Plato, Polybius, and Xenophon, as well as in Roman ones, such as Cicero and Livy. More recent roots can be found in Cola di Rienzo and Francis Petrarch. Liberty is conceived as city-state autonomy, and a free people is one that is *sibi princeps*, i.e., not under the jurisdiction of foreign powers and is living under its own laws. To maintain its freedom, a community needs to defend itself from foreign enemies. Salutati and Bruni defend Florence by celebrating its liberty and virtue as heir of the Roman republic. Liberty must be defended also from domestic enemies, i.e., from tyrants. Their works and those of others point to an intense Renaissance discussion of what a tyrant is and whether it is right to kill him. Within the discussion on liberty, an important role was played by Machiavelli. For Machiavelli, liberty consists in the ability of the people to make their own laws and to consent to government policy, promoting the common good. Liberty occurs within a republic, but not necessarily, and should be preserved at all costs.

Liberty in the Renaissance: Political

Gian Paolo Terravecchia
University of Padua, Udine, Italy

Abstract

Liberty is an important issue in Renaissance political thinking, yet it often remains implicit in the texts or, when explicit, is not addressed directly. The main contributions on this topic are those by Coluccio Salutati, Leonardo Bruni, Alamanno Rinuccini, Étienne de La Boétie, and, above all, Niccolò Machiavelli. These contributions are developed in works where history, politics, and literature are

Heritage and Rupture with the Tradition

Renaissance authors consider liberty an important issue; nevertheless, the topic is usually implicit in their texts or, when explicit, it is treated in connection with other issues. For their contributions on the topic, one should mention at least Coluccio Salutati (1331–1406), Leonardo Bruni (1370–1444), Alamanno Rinuccini (1426–1499), Girolamo Savonarola (1452–1498), Francesco Guicciardini (1483–1540), Étienne de La Boétie (1530–1563), and, above all, Niccolò Machiavelli (1469–1527). In their works, history, politics, and literature are intertwined. For this reason, one cannot find a straightforward philosophical approach to liberty

in Renaissance authors. Philosophy of politics is a discipline that has some of its modern roots in Machiavelli's texts, yet not even there its focused expression.

As is known, Greek and Roman classics are the sources of inspiration for Renaissance authors. For instance, Salutati quotes from Latin (especially Cicero) and Greek authors, but it is noticeable that he uses unusual sources for his time, such as Plutarch and Ptolemy. Bruni translated (and was influenced by) Aristotle's *Nicomachean Ethics* and *Politics* and some of Plato's dialogues, such as the *Apology*. His knowledge of the ancient city-states of Greece led him to consider Florence as a new Athens. His *Laudatio* of Florence is inspired by the *Panathenaic Oration* of Aelius Aristides. Cicero's *Paradoxa Stoicorum* (see V, I, 34), as well as Aristotle's discussion of the republic in the *Politics* are important sources for Rinuccini's discussion of liberty. Machiavelli's works show a deep influence from Aristotle, Plutarch, Polybius, Frontinus, and Vegetius, among others. Livy holds a special place. Indeed, Machiavelli openly refers to Livy in his *Discorsi sopra la prima deca di Tito Livio*, a commentary where one finds almost all his ideas on liberty. In writing his masterpiece, *De principatibus* (or *Il principe*), Machiavelli uses a literary genre of political writing that has its most famous example in Xenophon's *Cyropaedia: The Education of Cyrus* and many instantiations during the Middle Ages. This genre of mirrors or advice books for rulers (*principum specula*) contains examples of what to do or what to avoid. If these are the deepest roots grounding Renaissance authors' thought, there are some others that are less deep and yet not less important. They can be found at least in Cola di Rienzo (1313–1354) and his dream to ensure the freedom of the Italian cities through the *Romana libertas* and in Francesco Petrarca (1304–1374), who strongly influenced Salutati and Bruni.

In Italy, the pressing political events of the age placed liberty at the top of the agenda. It is in fact the central concern of the Italian states to preserve their liberty, i.e., the city-state autonomy. In this sense, a city is considered free if it is *sibi princeps*, because it lives under its own laws and not under

the jurisdiction of foreign powers. The danger comes, from time to time, from the other (city-) states or from the Empire or, more generally, from the feudal order. Important antecedents can be found in the fall of the Duke of Athens (1343), a ruler of Florence considered a tyrant, and in the war of the Eight Saints (1375–1378), fought under the motto "*Libertas*." Taking this into consideration, it is not surprising that the most important Renaissance studies on liberty are by Italian authors or were deeply influenced by their writings. The *Discours de la servitude volontaire* (1576), written by Étienne de La Boétie, a close friend of Michel de Montaigne, may seem an exception but only if one does not consider that the young Étienne entered in contact with Italian humanism, probably through the influence of the Florentine Niccolò Gaddi. When considering the authors outside this tradition, it is easier to discuss why liberty is not on their agenda rather than to find their implicit positive contents on the topic. This could be done, for example, with Thomas More's *Utopia* (1516) or with Jean Bodin's discussion of sovereignty (*Six Books of the Commonwealth*, 1576).

Innovative and Original Aspects

The fight for liberty during the Renaissance period had two fronts. The first concerned the threat from outside and consisted mostly of the conflict between the city-states of Italy, although it often also involved powers like France, Spain, and the Empire. Giangaleazzo Visconti's politics has been particularly studied: during the last decade of the fourteenth century, Giangaleazzo expanded Milan's domains, threatening Florentine freedom. Only the unexpected death of the "tyrant" (1402), as Florence called him, saved the city. This was the time of Coluccio Salutati who, in his letters as chancellor of Florence, celebrates the freedom and virtue of Florence, heir of the Roman republic. His position stresses the value of the republic but uses this word in the Latin sense of "*res publica*," which does not necessarily mean the republican form of the government. Close to Salutati, but presenting Florence as a republican city, was Leonardo Bruni (see his

Laudatio Florentinae urbis). Freedom consists for him in the equality of the citizens before the law and in their participation in public office. The two authors consider Florence as a bulwark of the *libertas Italiae*. This, at least, is the perspective to fully understand their engagement for the *Florentina libertas*. Their works are central to Hans Baron's influential *The Crisis of the Early Italian Renaissance* (1955). The book gave rise to a wide discussion, stressing the importance of the Visconti's failed attempt to extend the power of Milan to Florence. Baron identified the year 1402 as a turning point for the development of civic humanism in Florence. Even though many of the conclusions of the book are controversial and have been rebutted, Baron's idea that civic humanism inspired modern democratic values still stimulates scholarship.

The second front of the fight for liberty is internal to the city-state. It regards the need to prevent a single citizen from gaining so much power as to become a new tyrant. Historical examples of such a struggle for power in Italy can be easily found in Francesco Sforza and Cesare Borgia. A different path was taken by Lorenzo il Magnifico and more generally the Medici family, at least up until the end of the fifteenth century. Lorenzo formally preserved the Florentine Republic while at the same time maintaining de facto full political control. On the topic of the tyrant, the aging Salutati writes his famous *De tyranno* (1400), considered by many a "problematic book." It is in fact still a matter of debate how the defender of the freedom of Florence and the promoter of the republican propaganda of his city against the "tyrant" of Milan could defend the damnation of Brutus and Cassius, guilty of tyrannicide. This, at least, is their fate in Dante Alighieri's *Divine Comedy* (*Inf.* XXXIV, 61–67). Furthermore, Salutati rejects Cicero's critical opinions about Caesar. The author distinguishes between the origin of the name "tyrant," which is neutral, and its later association with an oppressive way of ruling and abusing the power. Salutati discusses Gregory the Great's definition of a tyrant as someone ruling a commonwealth without right. He adds that the tyrant either has taken possession of the commonwealth without any

title, or rules unjustly, disregarding laws and rights. Starting from this definition and on the basis of some historical justifications, Salutati does not consider Caesar as a tyrant because, apart from how he gained power, he was a just man in many aspects. Therefore, Salutati condemns Brutus and Cassius, whose acts were unjust and driven by pride and the desire for their own glory. Salutati also states that "there is no greater liberty than obedience to the just commands of a virtuous prince" (IV, 16), so that principality and liberty do not seem incompatible.

Very distant from Salutati's line of reasoning is Alamanno Rinuccini's *Dialogus de libertate* (1479). This work, written against Lorenzo de' Medici, accused him of being a tyrant. It must be noted that Rinuccini had fallen in disgrace with the Medici and was excluded from the political life of his city. The dialogue presents and discusses a definition of liberty as the power to live freely within the limits set by law and custom. He insists: to obey the law is the highest freedom. He uses this premise to take a stance against Lorenzo, seen as one who sets himself above (and against) the law, abolishing political equality and free speech.

While Rinuccini was a victim of the Medici family, Girolamo Savonarola was its mortal enemy. A charismatic Dominican friar, Savonarola combined republican fervor with the call for moral and spiritual reform. His sermons present freedom as the outcome of moral reform in the direction of Christian life. But Savonarola's terrible fate (he was tortured and burnt at the stake) put an end to the idealistic way of thinking about politics.

The Dominican's fall was followed by the political fortune of Niccolò Machiavelli. *Il principe*, however, came after and probably because of its author's later political misfortune, when the Medici family returned to Florence in 1512. This work is not a literary exercise, a Utopian phantasy, or a moral reflection. It is rather based, in the author's intentions, on the observation of human behavior. He studies the contemporary political reality and learns lessons from the wisdom of the observers of the past. His method – a mixture of rules of thumb, observation, historical knowledge, and general

sagacity – and his tone are empirical. His conclusions have a cynical, distrustful, and pessimistic tone. Liberty is often identified by Machiavelli with republican institutions, in antithesis to tyranny (see the *Discorsi* and the *Istorie fiorentine*). It consists of the ability of people to make their own laws and to consent to government policy promoting the common good (*Discorsi*, II, 2, 12). A free city is very dynamic economically and politically, much more than an oppressed one (*Discorsi*, I, 58, 30; II, 2). Liberty should be preserved at all costs, whether or not it involves justice or injustice, pity or cruelty, and praise or blame (*Discorsi*, III, 41). Machiavelli stresses this point, claiming that Brutus was right to kill his own children to save liberty in Rome (*Discorsi*, III, 3, 2). To defend liberty, one needs good armies, competent generals, and appropriate strategies. These can and must be used also to gain and control the domains that allow internal freedom (*Discorsi*, I, 1, 15). It is much better if the army is composed of citizens (rather than mercenaries), as this will reinforce civic virtue. At the same time, the martial spirit of the army will be strengthened. Inner moral strength, loyalty, public spirit, civic sense, and dedication to state security are needed for the peace and the glory of the *patria*. These are the virtues of a secular, humanistic, naturalistic morality. A corrupt state, on the contrary, cannot remain free for long (*Discorsi*, I, 16 and 17). Besides, citizen armies are more motivated and loyal than mercenaries or troops led by foreign generals. In order to maintain its stability, a republic also needs good orders, i.e., good constitutions, laws, institutions, and good methods of governance (*Discorsi*, I, 49). They must preempt or punish calumnies, honor those who are deserving, and limit the power of individuals in charge, for example, by fixing a time limit for their exercise of power. Also, guardians and institutions are needed to check if there are citizens attempting to jeopardize freedom. Public accusations and popular verdicts will stop ill-disposed citizens from threatening the state. This will help to maintain peace, controlling the mood of the people, which could otherwise result in violence and riots (*Discorsi*, I, 7). Religion is also very important (*Discorsi*, I, 11), so much so that, as he writes, “there can be no greater indication of the ruin of a state than to see a disregard for its divine worship” (*Discorsi*, I,

12). Here Machiavelli shows that he has accepted and made his own one of Savonarola’s ideas, the connection between religion and liberty. Of course, the general background of the two is profoundly different. Indeed, Machiavelli thinks that religion is important only because it gives the citizens reasons to place the common good before their own interests.

In most cases, the existence of factions is an internal enemy of freedom for Machiavelli. In fact, factions usually bring about internal weakness and corruption. But divisions are not necessarily negative. For example, the division between patricians and plebeians in ancient Rome gave rise to the laws in favor of liberty, so that in the end even the tumults between the two groups can be considered positive and should not be condemned uncritically (*Discorsi*, I, 4). The constitution must be flexible enough to allow conflict between opposing social forces, wherein each part can find a proper compensation. Machiavelli’s praise of divisions has often been considered one of his major contributions. This, at least, is the line of the “republican” Machiavelli, especially in his *Discorsi* and, to a lesser extent, in *Dell’arte della guerra*.

However, as some authors underline, Machiavelli’s thinking on liberty cannot be simply equated with republicanism. He connects liberty with “certain personal rights and community benefits that characterize free states regardless of their constitution” (Colish 1971, 345–46). The compatibility depends on a notion of liberty as protection of private rights. And yet there are limitations: it is difficult to have liberty in a monarchy because monarchy tends to be despotic and tyrannical. There are rare exceptions, for example, if the ruler has popular support or establishes good laws, promoting harmony and welfare. Few men desire freedom to wield power: most people desire freedom to gain security (*Discorsi*, I, 16). For this reason, if a prince can control and give honors to the first kind of men and security to the others, it will be easy for him to maintain power. People tend to be conservative and are inclined to maintain institutions and customs they are used to. The consequence is that a people used to live under a prince will find it difficult to maintain their

freedom if it is suddenly set free. Regarding the tyrant, Machiavelli disagrees with Salutati: Brutus is the “father of the Roman liberty” (e.g., *Discorsi*, III, 1), the liberator of his people. On this line, La Boétie, in his *Discours de la servitude volontaire*, considers Brutus and Cassius defenders of freedom, brave as very few. He stresses, in fact, the responsibilities of the people, usually passive and weak in letting the tyrant rule for his own advantage and for the people’s misery.

Impact and Legacy

The *fortuna* of Machiavelli’s ideas on liberty is deeply bound up with the *fortuna* of Machiavelli’s thought *tout court*. He has been studied and discussed, criticized, or appreciated by politicians (e.g., Frederik the Great’s *Anti-Machiavel* and Benito Mussolini’s “Preludio al Principe”), historians (see, e.g., Pocock’s monumental *The Machiavellian Moment* and his idea of an “Atlantic republican tradition” or Skinner’s *Liberty before Liberalism*), and political philosophers (e.g., Hobbes, Locke, Montesquieu, Rousseau, Fichte, Hegel). The idea of “*Florentina libertas*,” conceived as a republican form of government, ends with the mature Francesco Guicciardini. Against the republican thought of authors such as Bruni, Guicciardini opposes a disenchanting view: “I have often pondered on the fact that this word ‘liberty’ is frequently used more as a disguise and an excuse by those who want to conceal their cupidity and ambition than because men in fact have a natural desire for it” (*Dialogue on the Government of Florence*, 35). Furthermore, Guicciardini, (who was so close to the Medici family that he served as Alessandro’s adviser), defends principality as a form of liberty, since Florence is ruled by the Medici family, that is, by the Florentines.

Abstract

Liceti is the last of the great Paduan Aristotelians. His extensive works cover all areas of

natural philosophy, and while Liceti is always careful to give full expositions of the diverging strands of Aristotle's interpretation on any given subject, he does not hesitate to use traditional conceptual frameworks to develop innovative theories. One example of this is his conception of rational souls as immaterial but quantitative, extended beings. To explicate this conception, he uses an analogy between rational souls and the theory of light developed by the eclectic medieval natural philosopher Albert the Great, who argued that the dependence of light on a source from which it arises through emanative causation renders light existentially independent from the medium that it illuminates. Another innovative aspect of Liceti's thought can be found in his version of the traditional theory of spontaneous generation. Unlike any thinker before him, he held that the substantial forms of living beings arising through spontaneous generation could be understood as material structures that arise through the completing of previously existing, but essentially different material structures.

Biography

Fortunio Liceti is an eclectic Aristotelian natural philosopher who held professorships in philosophy at the Universities of Pisa (from 1605), Padua (from 1609), and Bologna (from 1637) and took up a chair in theoretical medicine at the University of Padua in 1645. His intellectual autobiography (Liceti 1634) lists 24 published books, some of them very extensive, as well as 25 unpublished book manuscripts, some of which were published afterwards (see Lohr 1978, 540–541; Ongaro 2005). His writings cover all fields of natural philosophy, with a particular emphasis on biological and medical issues (for overviews, see Ongaro 1964, 1965). In particular, he is the author of a widely cited work on monsters (Liceti 1616b; see Céard 1977, 442–447, 451–456; Hanafi 2000, 34–47). From a philosophical point of view, two of his most original contributions relate to the theory of spontaneous generation (see Castellani

1968; Hirai 2007, sect. 3, 2011) and the metaphysics of immaterial extension (see Blank 2013). With respect to the former issue, he proposes an analysis of the notion of substantial form of spontaneously generated living beings in terms of material structures that are in a rudimentary way present in inanimate objects and only require completion through external causes. With respect to the latter issue, he can be seen as a precursor of Henry More's famous view that immaterial beings are extended but indivisible.

Heritage and Rupture with the Tradition

Liceti interprets Aristotle's conception of the soul as implying a dualistic conception of the human soul. He maintains that in the operation of the vegetative and sensitive parts of the human soul nothing immaterial or supernatural is involved. "For me, a human being is a natural and material body; hence, it is subject to natural passions arising out of matter, to generation and death; its soul, therefore, is generated out of matter, and is mortal . . ." (Liceti 1602, 301). At the same time, he accepts Aristotle's view that the rational soul is divine and enters from the outside (see Aristotle, *De gen. an.* II, 3, 736b27–29). Consequently, he understands the human soul as a composite being: "The intellect is not the form of the entire human nature but a part of such a form, which is the human soul, having a composite nature constituted by intellect, vegetative soul, and sensitive soul . . ." (ibid., 300). Liceti maintains that material souls and organic bodies stand in a relation that he calls "co-extension." For instance, with respect to nutrition, he argues that the vegetative soul is where the operations occur, of which the soul is the primary efficient cause since, according to Aristotle, all physical action is by contact; moreover, everything that is nourished is nourished with respect to the smallest part of its body (Liceti 1616a, 12; see Aristotle, *Aristotle, Phys.*, VII, 10–12; VIII, 33; *De an.*, II, 3–4). Likewise, the sensitive soul must be coextensive with the organism because the proper functioning of the vegetative soul depends on the proper functioning of the sensitive soul (Liceti 1607,

137–138; for the role of material souls in Liceti's theory of sexual generation, see Blank 2010).

However, Liceti deviates from the traditional view that takes immaterial beings to be non-quantitative. Rather, he maintains that the rational soul, too, is coextensive with the body that it animates. This is so, he argues, because the proper functioning of the vegetative and sensitive parts of the human soul depends on the proper functioning of the rational faculties (Liceti 1616a, 40). Still, he takes immaterial souls, in contrast to material souls, to be indivisible. To explain why this is so, he invokes an analogy between immaterial souls and light (for his later theory of light, see Zoubov 1936). The relevant analogy makes use of a combination of ideas that Liceti derives from Albert the Great: (1) the view that light can be understood as a quality inherent in the source of light (*lux*) and (2) the view that light can be understood as a quality that derives by means of emanative causation from *lux* and is present in an illuminated medium (*lumen*) (see Liceti 1607, 68–69; Liceti 1640, 115–116). *Lumen* is an immaterial being that is extended without being divisible: "Since *lumen* in the perspicuous body is not there as an indivisible point but rather is coextensive with every dimension of the perspicuous body" (Liceti 1616a, 54). Still, due to the emanation relation between *lux* and *lumen*, *lumen* is existentially independent of the perspicuous body: "[*L*]umen is said to be external to the air whose assisting form it is since it does not depend on the air, even though it actualizes the innermost parts of the air" (Liceti 1629, 151). This is why *lumen* is not moved "through the motion of the body, and is not corrupted through the corruption of the body . . ." (ibid., 167). Consequently, it also cannot be divided through the division of the illuminated body. Likewise, mental operations can be understood as emanating from the mind and, therefore, as being independent of the changes in the body that they animate.

Innovative and Original Aspects

While Liceti's conception of immaterial extension thus can be understood as a creative application of

existing theories of light to the analysis of the quantitative nature of the rational soul, Liceti's version of the theory of spontaneous generation was seen by his contemporaries as a more radical departure from all existing theories in this field. Liceti's theory of spontaneous generation shares with many other Aristotelian positions the view that a composite substance is constituted by an organic body and a substantial form that functions as the principle of unity of the organic body. At the same time, in contrast to what everyone else held, Liceti believes that a substantial form allows for a kind of composition: "Nevertheless it does not have a simply simple nature; rather, as all souls, so the forms of mixed bodies on earth have a nature that is composed out of different essential part; . . . such that every form is essentially constituted by its genus and a specific difference . . ." (Liceti 1618, 267). He suggests that such a conception of the composition of a substantial form makes it possible to understand substantial forms as the outcome of a kind of augmentation. He argues that in matter there are "rudiments of form" that contain the generic nature of individual forms but that lack the specific differences characteristic of individual forms. As he puts it, "in matter there pre-exists a rudiment of the future form, which is the generic nature of this form, subsisting under a privation opposed to the form; the efficient cause of the form that adds the specific difference of form is said both to constitute form and to bring about generation" (ibid., 266). Liceti is careful to point out that "[t]his rudiment of form is not truly a form but rather its generic nature" (ibid.). In Liceti's view, the task of the efficient cause of spontaneous generation is only to add the specific difference to constitute an individual substantial form. Thus, Liceti understands what is potentially in matter as being neither a mere accident nor a complete form. Rather, he takes it to be a material structure that needs to be completed in order to be capable of acting as a substantial form. Also, the transition from the generic rudiment of form to the fully individualized form of a living being involves the occurrence of something genuinely new, thus accounting for the intuition that spontaneous generation is something other than the development

of some preexisting composite that remains the same individual.

Liddel, Duncan

Abstract

The Scottish polymath Duncan Liddel has received significant recent attention for his international scholarly career. Trained after the humanist model, Liddel interested himself in contemporary developments in mathematics and astronomy. He is considered the first to have taught the astronomical systems of Tycho Brahe and Nicolaus Copernicus alongside the older Ptolemaic system. Involved in the Helmstedt *Hofmannstreit*, he influenced the development of Germany's Melancthonian inheritance. He published many successful medical texts, and his library is still held by the University of Aberdeen.

Biography

After his early studies in Aberdeen, Duncan Liddel traveled to Frankfurt an der Oder by way of Gdańsk. There he met his countryman John Craig, who provided him with the means for his further education and who remained a lifelong friend. Liddel studied in Frankfurt and Breslau, where he learned the Copernican system from Paul Wittich, before turning his attention to teaching. Following a brief time in Frankfurt, he began teaching mathematics and astronomy at Rostock University, becoming close friends with the renowned humanist Johann Caselius. During this time, he met Tycho Brahe and learned of his astronomical hypotheses. Through the influence of Caselius, Liddel obtained a position teaching mathematics at Helmstedt University in 1591. Having pursued an interest in medicine throughout his academic career, Liddel finally received a doctor of

medicine degree from Helmstedt University in 1596 and became a professor of medicine in 1600. He was dean of the philosophy faculty in 1599 and became prorector of the university in 1604. Having accumulated a comfortable fortune, Liddel returned to his homeland in 1607. Before his death, he bestowed substantial grants upon the University of Aberdeen and Marischal College.

Though relatively unknown today, Liddel was in his time a renowned professor of mathematics and of medicine. Having pursued his academic career in Germany rather than his native Scotland, Liddel is seen as an example of the scholarly networks that extended between Scotland and the continent in the late sixteenth century. As a polymath, Liddel represents the connections and conflicts between the various emerging sciences of the late Renaissance, especially astronomy and medicine, as well as the traditional sciences of theology and philosophy. A foreigner seeking his fortune in Northern Germany, Liddel's career also highlights the political and economic nature of scholarly activity, including teaching, publishing, and patronage.

With his broad quotation of Aristotle, Galen, and Hippocrates, as well as of Latin and Greek literature, Liddel places himself solidly within the humanist tradition, but he also maintained an eager interest in the innovative astronomy and mathematics of his time. According to a letter written by Caselius, Liddel was the first to teach Copernicus and Brahe alongside Ptolemy in his astronomy lectures. He even mixed these newer ideas with his own hypotheses, which led to a charge by Brahe that Liddel was stealing credit for Brahe's work. Liddel seems to have been interested in these systems primarily on a theoretical rather than practical level. He taught astronomy as a branch of mathematics and considered the various cosmological schemes from a mathematical perspective, not according to their physical tenability.

Liddel became involved in the *Hofmannstreit* at Helmstedt University, a debate over the relationship between philosophy and theology. Through his writings on that controversy, Liddel contributed to the development of Germany's

Melanchthonian inheritance, especially with regard to the role of natural light in philosophy and the central importance of mathematics among the disciplines. His medical works were very successful, reprinted in many editions, and highly regarded long after his death. He never subscribed to the innovative and popular ideas of Paracelsus, though he owned and carefully annotated several of his works, and he put forward the traditional ideas of Galenism.

Liddel is remembered at Aberdeen by a bronze plaque in St. Nicholas Kirk. The University of Aberdeen holds his personal library, which contains one of the three surviving copies of Copernicus's *Commentariolus*, transcribed by Liddel himself.

Life in Renaissance Philosophy

Georg Toepfer and Uta Kornmeier

Abstract

The concept of life has always served as an idea integrating thoughts on this world and the afterlife, on the physical and the spiritual existence. Thus, it has been a subject in the humanities as well as in the natural sciences. As a consequence, the term has always been ambiguous. For the natural sciences, Aristotle laid the foundation by identifying functions such as nutrition, growth, reproduction, and perception as criteria for the definition of life, while recognizing that this plurality of criteria resulted in “being alive”, meaning different things to different beings (thus turning the term into a “homonym”). In the Middle Ages, the concept was integrated into Christian theological thought and took on a strongly dualistic meaning: the “real” or “true life” was now the eternal life, while the “mortal life” of animals and nonbelievers became a second, lesser category. Consequently, Christian thinkers showed little interest in the efforts to explain the phenomena of life through the natural sciences. This situation changed in the twelfth century with translations of Aristotle’s works into Latin which brought attention back to the organic aspects of life. Scholars opened their minds to the

knowledge of craftsmen and artisans such that the concept of life developed within a complex network of communication between individuals from theoretical and more practical backgrounds. By this movement, physiology was gradually taken out of theological and medical contexts and considered in its own right. With the emergence of the natural sciences in the early seventeenth century, mechanistic and quantitative analyses were introduced into the study of living beings. While trying to explain the processes of life mechanically, most authors of the time retained the Aristotelian idea of living beings as substantial forms.

Heritage and Rupture with the Tradition

The concept of life has a long-standing tradition of gathering and absorbing many disparate aspects of (human) existence. It is a subject of the natural sciences as much as of philosophy, history, and religious thought. Since Antiquity, “life” has been a well-established category in the natural sciences, and, at the same time, a widely used concept for the description of individual human biographies as a unity connected to aspirations and values. Aristotle, for example, already touched on the descriptive-evaluative ambiguity of the concept when he claimed in his *Politics* that “there is some element of value contained even in the mere state of being alive” (*Politics* 1278b26). This value was expressed, according to Aristotle, in the fact that in their desire for life, humans were willing to suffer as if life in and of itself included some kind of happiness. Thus, Aristotle attaches value not only to an individual course of life (*bios*) but to sheer life itself (*zoe*). Within the natural sciences, the concept carries further ambiguities, describing, for example, a general mode of being (a form of existence depending on the activities of the existing entity), a state of an individual being (alive vs. dead), or a sum of actions and experiences (the life of X).

The Renaissance concept of life draws heavily on Aristotelian thought. In *De anima*, Aristotle

established living beings as a distinct ontological category – they were not conceived as bodies with the accidental property of being alive, rather “life” was their essence, or irreducible mode of being. Therefore, inanimate machines and man-made automata could not serve as explanatory models for living beings. Aristotle generally agreed with Plato in that the ability to move was a key sign of life, and that movement and therefore life was made possible by the soul. However, the soul is not life itself, it rather is the principle that moves the body and thus makes life possible; its relation to the body, as Aristotle wrote, is like the relation of a wax figure’s shape to the wax which gives expression to the shape without actually being the shape. The life of a being was described as not existing independently of the bodily functions but as anchored in them in an analogous way in which seeing is connected to the eye (*De anima* 412b10). Thus, the soul of a living being has been interpreted as to its organization or organizing principle (Quarantotto 2010).

Furthermore, Aristotle determined certain bodily functions such as nutrition, growth, reproduction, and perception as criteria for a definition of life. Since animals and plants do not share all the life functions – for example, plants were not seen to have perception – life means something different to different beings. To Aristotle, the concept of life was fundamentally heterogeneous, and he explicitly called the term “homonymous” (*Topics* 148a).

In the Middle Ages, this heterogeneous concept was integrated into Christian theological thought and took on a strongly dualistic meaning: the “real” or “true life” was now the life in God, the eternal life, while the “mortal life” of animals and nonbelievers became a second, lesser category, that meant solely being alive without the hope of salvation (also called the “life of the flesh” in Christian texts). This devaluation of earthly existence led some Medieval thinkers such as Meister Eckhart to even deny “true life” to all earthly creatures because their origin and purpose were external to them (due to the act of creation by God), whereas true vitality was conceived to be self-sufficient, with cause and effect within itself. Thus, the concept of “life” as derived

by Aristotle from the vital functions of the body dissolves into the idea of a Christian soul and divine principle. This subtraction of the organic functions has been called “divinization” or, in a secular context, even “depletion” of the concept of life (Ingensiep 2001, p. 141).

This shift towards the divine sphere is remarkable because it means that the concept no longer serves to describe actual objects in nature – living beings – but has gained a strong evaluative aspect; life was seen as a divine gift rather than an explanatory principle. This may help to understand why earlier Christian thinkers showed little interest in the efforts to explain the phenomena of life by the natural sciences.

Innovative and Original Aspects

From the twelfth century onwards, Latin translations of Aristotle’s works led to a long period of philological and philosophic debate on Aristotelian thought. This brought attention back to the organic aspects of life and paved the way for a new type of thinking more interested in the secular workings of the world. Scholars opened their minds to the knowledge of craftsmen and artisans organized in guilds who traditionally passed on their knowledge orally. At the same time, those confronted with the practical side of the medical faculties, namely pharmacists and surgeons, began writing encyclopedic treatises, first of all on herbs and anatomy. Now, the concept of life developed within a complex network of communication between individuals from theoretical as well as more hands-on backgrounds. From this exchange of knowledge and ideas between “practitioners” and academics emerged new models to explain the functioning of living beings.

By 1500, this combination of practical needs and scientific accuracy resulted in a new figure, the scientist-artist, with Leonardo da Vinci as a prime example. The detailed, almost technical drawings he made of the internal organs which he studied by actually dissecting human bodies set a precedent for an empirically tested and precisely described anatomy, which provided the basis for calling traditional physiology into question.

A milestone in this critical revision was Andreas Vesalius’ illustrated anatomy book *De humani corporis fabrica* (1543). Drawing on his hands-on experience as a dissector and anatomist at the University of Padua, he found and corrected hundreds of errors in the anatomical teachings of the antique authority Galen. Antique tradition, however, held such a sway over European learning that Vesalius did not initially dare to doubt Galen’s description of blood passing through the septum of the heart, although he could not find any passageways. Only in the second edition of the *Fabrica*, 1555, did he privilege his own observation before tradition even in such an important matter.

In general, the classical Greek concept of life lost some of its importance during the Renaissance. Self-preservation was now seen as the main characteristic of all living beings. Paracelsus, for example, called life a “certain embalming substance” (*mumia balsamita*) that keeps the body from deteriorating (*De vita longa*, 1526–1527, p. 249). Thus, the individual body itself is not alive as such, but retains life as something which resides and grows in the body and is eventually passed on. This notion of life not as an organized structure or as a property, but as matter, like a chemical substance, was widespread during the sixteenth century. It formed the basis for the thinking in analogies and harmonies, which meant that the human body was a “microcosm” that corresponded with the whole of the universe, the “macrocosm,” since both were made from the same substance and were governed by the same laws.

Early in the seventeenth century, physiology was taken out of theological and medical contexts and considered in its own right. Galileo’s friend Santorio Santorio was the first to introduce quantitative methods into the study of human physiological processes (*De medicina statica*, 1614). William Harvey followed his lead by measuring the amount of blood flowing within the body, which led him to discover the circulation of blood in humans and animals (*Exercitatio anatomica de motu cordis et sanguinis in animalibus*, 1628). This revolutionary new idea was confirmed by Marcello Malpighi by the use of

a new piece of technology, the microscope, enabling him to see and describe red blood cells and capillary vessels (*De pulmonibus*, 1661).

Consequently, seventeenth-century physiology became dominated by a mechanistic interpretation of the processes of life, programmatically formulated by René Descartes. By comparing physiological processes with simple mechanical and hydraulic devices such as levers, gears, pipes, and pumps, he replaced the idea of life as substance with the image of life as clockwork. Thus, living beings could be analyzed just like any other material body. Descartes explicitly declared in his posthumously published *Traité de l'homme* that organic functions are the result of the disposition of the organs the same way the movement of a clock or machine results from the arrangement of its cogs and wheels (1632, p. 202). This also meant that living beings were no longer regarded as a unified body or entity, but as a structured system with distinct parts working hand in hand to sustain the functioning of the system. As a consequence, the concept of life as an ontological category or an irreducible mode of being, in this mechanistic view, disappears from the natural sciences.

Impact and Legacy

Descartes' renunciation of the soul as an explanation for life was immensely fertile as it liberated the scientific research of life from the obstacles of the traditional metaphysics of the soul. During the seventeenth century, the idea that it is the reciprocal relationship between the parts of the organic body that really constitutes life processes gained popularity. Matter was considered alive only in as much as it was well-organized like an automaton. The analogy between living beings and machines was not necessarily meant to be deprecatory, as it was also used to point out the admirable smooth cooperation between the various parts of the living body. In 1644, Kenelm Digby marveled at the "variety [that] should be in one thing; whose unity and being what it is, should depend on the harmony of the severall differing partes, and should be destroyed by their separation." He stresses the

necessity of the parts to "conspire together" in order to uphold the complex functions of the living body as a whole (1644, pp. 205, 208). All in all, this is an analysis that works without a central life principle, such as the soul, because life is not an effect of the workings of a higher power but of a causality distributed across the components of a system.

However, the functional organization of different parts of a machine-like system was not the ultimate condition of life for all seventeenth-century authors. In 1659, Henry More, a Platonist from Cambridge, emphasized the role of specifically predisposed physical matter in the generation of life. The "plastical power," as More called the vivifying principle, needs "duly-prepared Matter" in order to organize it into life (1659, p. 46).

Late seventeenth-century post-Cartesians searched for a middle ground between Descartes' mechanical reductionism and the Aristotelian substantial dualism of living and nonliving beings. Charles Perrault, for example, in his *Mécanique des animaux* (1683) explained the animals' life functions in a mechanistic way, but explicitly separated animals from mere machine as beings with emotions and a soul – a soul that drives the animal machine and enables it to function as a living being (1683, p. 329). Thus, by retaining the idea of living beings as essential substances, the dualism of the living and the nonliving was maintained on an ontological level, while it has been given up on the level of explaining the processes of life.

For much of the Middle and early-modern ages, the position of the concept of life either as an object of the natural sciences or a qualitative value in a religious or cultural view remained undecided. Johannes Clauberg in his *Logica vetus et nova* (1654) calls the concept explicitly "vague" and "uncertain" (1654, p. 877). He cautions his readers to examine the term critically as it did not differentiate accurately between a physical and spiritual or intellectual dimension; it was applied to too many heterogeneous phenomena and did not suit the Cartesian ideal of clear and precise cognition. In general, it can be observed that the concept of life underwent an increasing secularization during the seventeenth century: its

religious and transcendent aspects lost momentum and seemed to disappear behind the rise of a purely natural scientific meaning of the term. However, there was also an increasing secular use of the term in its former theological sense as can be seen in Clauberg when he calls the act of thinking “life” (1656, p. 679) – as do other authors such as Spinoza who defines intelligence as the “life of the mind” (1677, IV, App. c. 5).

Light Theory

Abstract

Renaissance advancements in light theory were grounded in innovative approaches to optics and ray theory by both scientists of the Arabic-speaking world as well as the great Scholastic philosophers who incorporated their discoveries into the edifice of Western proto-science. Heavenly lights – stars, planets, the sun, and virtually any body that transited the sky – were slowly evolving from religious phenomena to objects of natural philosophy. An arc can be followed from Classical and Neoplatonic philosophy to that of Medieval Arabic and Scholastic philosophy that increasingly views light (and other forms of radiation, whether or not they were visible), in new material and predictable terms. These advancements in knowledge about the properties of light led to the development of new ways in which humanity manipulated and interacted with light in the Renaissance.

Impact and Legacy

Ideas about vision and optics from the ancient world were a critical component within the framework of how celestial radiation, most evidently vis-à-vis light but not necessarily restricted to visible light, was understood and imagined. A critical revolution in how man conceived of his place in the cosmos was the relation of the celestial rays, and all that they were believed to bring, to the action, properties, and reception of light. Vision evolved from its perception as a threshold to an intellectual understanding of the heavens towards a physical channel for celestial rays (either directly from the heavens or the secondary radiation perceived to be emitted from astral images) through the eyes to the soul. For Aristotle, images entered into the eyes immaterially, preserving only their qualities. Other ancient philosophers advanced a more active participation of vision with the material world, a theory known generally as extromission. Plato, Galen, and others subscribed to the idea that eyes emitted their own rays which, diffused into the material world along with the all-present rays of Spiritus (as understood by Platonists and the Stoics), made contact with the visible surfaces of objects and brought information back on its return to the eyes. One theory conceptualized the force of vision rays from the eyes being enough to occasion a vibration in the materials they contacted, which stimulated their own emission of rays in turn, which proceeded to transmit their information to the eye (versus the “bounce-back” model of the eye’s original rays). In a model that would be adopted and promoted later by the scholastic philosophers of the Middle Ages, these light rays were believed to be in a continuous state of transmitting to the eye a mathematically exact copy of the original object, the image, whether or not they happened to be illuminated. Ancient atomist theories of Democritus and Lucretius imagined a

very material process by which this took place: material, atom-thin copies physically peeled off the original and traveled along the ray, physically entering the eye.

Light also was perceived as a divine presence, indeed the ongoing evidence of the first divine act of creation in Biblical accounts. Therefore, light continued its associations with the divine through the history of Latin Christendom, and Gothic architecture and stained glass have come to be symbols of this significance. The strict separation of heaven and earth built into the Aristotelian model of the element was later eroded by Neoplatonic emanation theories, which permitted constructs in which light, as well as physical rays from both the sun and other heavenly bodies, could penetrate the terrestrial sphere and effect changes therein. Al-Kindi and Al-Hazen refined this largely metaphysical conception of how this process was achieved, establishing laws for the behavior of light and rays which brought light’s understanding closer to the realm of natural philosophy than before. Scholastic thinking linked the brightness and splendor of light to divine, intellectual, and spiritual illumination, and the movements’ great philosophers undertook fundamentally new ways by which light was understood. Renaissance philosophers and artists built upon this tradition by pioneering advances in light manipulation which would characterize the era: Galileo’s telescope, Kepler’s pinhole camera, and Snell’s law of refraction, to name a few which paved the way for further advances in the Enlightenment.

Lilly, William

Born: 1 May 1602 Diseworth, Leicestershire

Died: 9 June 1681, Hersham, Surrey

William Burns

George Washington University, Washington, DC, USA

Abstract

William Lilly was the best-known astrologer of seventeenth-century England. He published a popular almanac series, a textbook, and pamphlets focusing on events of the day both political and celestial. Lilly saw astrology as a unified tradition stemming from Ptolemy and invoked the authority of ancient, Islamic, medieval, Renaissance, and contemporary astrologers without excluding any particular group or school.

Biography

Lilly was born into a family of yeomen. Frustrated their early ambitions of attending

university, he moved to London, where he married a wealthy widow. After his wife's death in 1633, he devoted himself to astrology, a subject in which he was largely self-taught. Lilly supported the Parliament against King Charles I in the British Civil Wars (1642–1649), although it took some time for him to fully commit to the Parliamentary side. The first edition of his almanac, *Merlinus Anglicus Junior*, appeared in 1644 when Lilly was still moderate, hoping for reconciliation between King and Parliament. Lilly moved toward the Parliamentary side in the following months and years, producing horoscopes that hinted at the death of the King – a very risky move. Lilly's *England's Prophetical Merline* (1644) used the recent great conjunction of Saturn and Jupiter in 1642/1643 and the comet of 1618 to argue that a change of dynasty in Britain was imminent, along with a great disaster to the house of Stuart, although Lilly did not flatly assert that the king's death would be soon. He attracted much admiration with his prediction of Parliamentary victory at the Battle of Naseby in 1645, one of the turning points of the Civil War – a prediction that appeared the morning of the battle itself.

Lilly also denounced people on the Parliament's side, including greedy, tax-raising politicians and power-grubbing Presbyterian ministers. He was even briefly imprisoned by the Rump Parliament, England's rulers after the execution of Charles I in 1649, when he denounced them in an almanac. Lilly's almanac, *Merlinus Anglicus Junior*, continued to dominate the market throughout the interregnum period (1649–1660), reaching a peak in sales of approximately 30,000 copies a year.

Lilly was the target of much anti-astrological mockery, particularly when he failed to predict the restoration of King Charles II, in 1660. Although he suffered the confiscation of some of his property and a brief spell of imprisonment, Lilly got away comparatively lightly – partly because he had stayed friends with influential Royalists like fellow-astrologer Elias Ashmole. Lilly continued to produce almanacs, although their sales dropped considerably after the

Restoration. He abjured politics except for the obligatory profuse expressions of loyalty to the King. Lilly spent the last few years of his life in country retirement, although he continued to produce an almanac.

As a working astrologer, Lilly was known for his mastery of horary astrology, answering questions based on the position of the celestial bodies when he was asked. His skill gave him a thriving practice as an astrological consultant independent of his almanacs and political work. Lilly's most influential text in astrology was *Christian Astrology* (1647), a book that influences astrologers in the English-speaking tradition to the present day. It is partially based on the work of the French astrologer and physician Claude Dariot (1533–1594), whose work had appeared in English translation as *The Judgements of the Starres* (1598) as well as other continental authors.

Abstract

Mostly known for his studies on Seneca and Tacitus and his extraordinary philological achievements, the humanist and classical scholar Justus Lipsius was also the founder of Neostoicism. His new philosophy, based on his readings of the Roman historian Tacitus and the Roman philosopher Seneca, aimed at Christianizing Roman Stoicism so as to make it acceptable and usable for his own time, which was blighted by bloody religious wars and civil strife. Lipsius's use of antiquity was both scholarly and practical. His edition of Tacitus (1574) not only was a groundbreaking philological monument but also inspired a new political movement, Tacitism, represented by his treatise *Politica* (1589). His edition of Seneca's prose writings was a landmark, but it was Lipsius's own *De constantia*, a Senecan dialogue written and published in 1583/1584, which became a Neostoic bestseller: printed more than eighty times and translated into various vernacular languages, Lipsius's consolatory dialogue was highly influential among Europe's elite and served as an inspiration for Baroque theater. His studies on the history and doctrines of ancient Stoicism, especially his two fundamental monographs published in 1604, marked a new start in the correct understanding of the Stoic philosophical system, which remained influential for over a century and a half.

Biography

Lipsius's biography has been reduced time and time again to his changes of religious allegiance. Already in his own time, the promoter of Stoic constancy was criticized for his extreme inconstancy (Morford 1991). This dubious reputation has lasted until our own day, even though the biographical facts and historical context demand more nuance.

Lipsius was born in Overijse (between Brussels and Leuven) to a Catholic family in October 1547. His father sent him to the Kapellesschool in Brussels for his primary education (1553–1557) and then to the Latin School of Ath (1557–1559), after which he enrolled in the Jesuit Bursa Nova Tricoronata in Cologne (1559–1564), but contrary to what has been repeated by some of his biographers, Lipsius never took Jesuit vows. In August 1564, he returned to Leuven to study law (Kluyskens 1973). In the following years, he also attended courses at the Leuven Collegium Trilingue, a humanist institution founded and inspired by Erasmus. As a young philological prodigy, he composed three books of textual comments and emendations, the *Variae lectiones*, which were published by Christophe Plantin in Antwerp in 1569. Immediately afterward, he embarked on an academic journey to Italy. In Rome, he was the private secretary to Cardinal Granvelle and made the acquaintance of leading humanists such as Marc-Antoine Muret, Fulvio Orsini, and Paolo Manuzio.

In 1570, Lipsius returned to Leuven to continue his legal studies. The conflicts in the Low Countries, however, compelled him to flee to Liège, where he encountered Carolus Langius, who would later be cast as Lipsius's guide to Stoic philosophy in the dialogue *De constantia*.

In the spring of 1572, Lipsius moved to Emperor Maximilian II's court in Vienna. In October, he was appointed professor of history at the Lutheran University of Jena. In this period, he also completed his edition of Tacitus, which he dedicated to Maximilian. In 1573, Lipsius married Anna van den Calstere in Cologne. One year later, he left Jena and returned to Overijse and Leuven. In September 1577, Lipsius was invited by Janus Dousa to the Calvinist University of Leiden, where he remained from 1578 to 1591, even

becoming rector of the newly founded university. During these years, he published his *De constantia* and the *Politica*, which immediately provoked bitter controversies due to Lipsius's views on freedom, predestination, and the right of rebellion. He decided to return to the Catholic Southern Low Countries, and after a short stay in Spa and Liège (1591–1592), he moved to Leuven in August 1592. There, he held the chair of history at the university and the chair of Latin at the Collegium Trilingue until his death in March 1606.

In this final period of his life, Lipsius published his major edition of Seneca (Papy 2002; Morford 2006) and his historical-philosophical treatises on Stoic doctrines and physics. In addition to books on classical scholarship and antiquarian treatises on the cross, the Roman army, Roman fortifications and armaments, ancient libraries, the Roman goddess Vesta, and the Vestal virgins, Lipsius also published on political philosophy. His *Monita et exempla politica* (1605), crammed with historical and philosophical examples, was intended as a sequel to his *Politica* (De Bom et al. 2011). Appointed royal historiographer in 1595 by the Archdukes of the Spanish Netherlands Albert and Isabella, Lipsius was also asked to write on local history and to produce devotional tracts in honor of the Holy Virgin. Lipsius was heavily criticized by his former friends and colleagues in the Northern Low Countries for supporting the Counter-Reformation agenda of the archdukes. He defended himself on various occasions and especially in his humanist letter collections of *Centuriae* (since each contained 100 epistles). In his published letters, Lipsius sought to showcase his central position in the Republic of Letters, his philological genius, his unparalleled historical knowledge of antiquity, and his commitment to the Neostoic program (Morford 1991; Laureys et al. 1998).

Classical Scholarship and Neostoic Philosophy

On Constancy (1584)

During his stay in Rome, Lipsius was introduced to Roman Stoicism by Marc-Antoine Muret

(Kraye 2001–2002). In the face of civic unrest, as well as the religious and political struggles of the Netherlands, Lipsius wrote his first Christian-Stoic work, *De constantia in publicis malis* (“On Constancy in Times of Public Calamity”) in 1583/1584. Here, Lipsius wanted to offer practical consolation to his contemporaries, helping them to cope with the difficulties of the civil and religious wars (Lagrée 1994). From Seneca, Lipsius took the guiding principle that “we are born into a kingdom where obedience to God is true liberty” (*De constantia* I.14, a quotation from Seneca, *De vita beata*, 15.8). Presenting a new account of the hierarchy of God, providence, and fate, Lipsius reestablished the leading role of necessity (*necessitas*): everything which is governed by fate happens by necessity (*De constantia* I.19) (Sellars 2014). It was inevitable that all temporal things would decay and be destroyed, so an attitude of constancy in the midst of *divinae clades* (divinely sanctioned disasters such as earthquakes, pestilence, war, and tyranny) was the only wise option. Divine punishment was part of God’s plan and necessary to preserve and improve the entire world (*De constantia* I.15–16). The truly wise man was therefore expected to accept the law of necessity (*lex necessitatis*) with steadfastness and mental strength. The virtues of *constantia* – “the upright and immovable mental strength, which is neither lifted up nor depressed by external or accidental circumstances” (*De constantia* I.4) – and patience must be governed by reason (*ratio*). The wise man (*sapiens*) will follow reason “to steel his mind and so temper it that he may achieve peace in the midst of turmoil and tranquility in the midst of conflict” (*De constantia* I.1). If reason conquers passions and false opinions, humankind will be able to confront public and private evils with true constancy. Three emotions must be extirpated – deception (*simulatio*), patriotism (*pietas*), and pity (*miseratio*) – since they are all harmful to peace. Once mastery over the emotions by reason has been achieved, humans can detach themselves from all feelings which might lead to any sort of emotional involvement in political and religious wars. In this way, Lipsius redefined Stoic *apatheia* or emotionlessness. The Neostoic wise man,

moreover, should not withdraw from public affairs or retreat into private life: he should instead be a cosmopolitan who submits to God’s plan and to the immutable power of (Christian divine) providence (Beuth 1990; Papy 2019).

Lipsius’s *De constantia* was a manual for wise living, a book of consolation, and a guide to practical psychology (Beuth 1990). Its success was immense: more than eighty editions between the sixteenth and the eighteenth centuries were published throughout Europe – more than forty in the original Latin and the rest in translations into several modern European languages (Bireley 1990; McCreia 1997). Lipsius’s dialogue, containing both themes from Calvinism and views on free will propagated by the Jesuits, became the common cultural property of scholars, poets, and artists from the Baroque period to the Enlightenment (Spanneut 1973; Carabin 2004).

Politica (1589)

Intended as a sequel to *De constantia*, Lipsius’s *Politicorum sive Civilis doctrinae libri sex* (“Six Books on Politics or Civil Doctrine”) was published in 1589. Just as the citizen had to follow reason (*ratio*), so, too, the ruler had to use reason and political virtue in governing his state. While invoking a wide range of classical thinkers and especially the Roman historian Tacitus, the humanist Lipsius wanted to be practical without, however, offering any concrete and contemporary applications of the general principles he expounded.

The *Politica*, divided into six books, is not a monograph but a commonplace book, in which Lipsius ordered his thoughts by drawing on ancient, medieval, and contemporary political thinkers. Montaigne described it as “a learned and carefully woven fabric” (ed. Lipsius 2004, p. 8). Nevertheless, the *Politica* is far more than a compendium of quotations: the order imposed on the quotations reflected Lipsius’s own thought. Moreover, Lipsius not only referred to classical writers but also discussed medieval and Renaissance political philosophers such as Thomas Aquinas, Niccolò Machiavelli, Jean Bodin, and the late Spanish scholastics.

The main aim of the *Politica* was to construct civil life and the state in an ethical context. The

politician needs to have virtue (*virtus*), which requires piety and goodness, and also prudence (*prudentia*). Civil concord was a central issue for Lipsius. To achieve this end, everyone had to submit to the will of the ruler, provided the ruler displayed both virtue and prudence. A distinctive virtue of the prince was political prudence (*prudentia civilis*). The study of history and sound advice (from officials, councilors, and military commanders) were both essential to a good ruler. Civil prudence concerns divine matters and human affairs. Lipsius's chapters on the difficult relationship of the state to the church and on religious toleration were controversial for both Protestants and the Roman Inquisition, since he argued that peace and unity could only be achieved if only one religion was allowed in any political community. In addition, the prince had no "rights in sacred matters" (*ius in sacra*; *Politica*, IV.2), so he must not intervene in the internal affairs of the church. Because religious discord inevitably led to civil war, religious dissidents deserved no mercy: "Burn, cut – for the whole body [of the state] is of greater value than some of its limbs" (Lipsius, in fact, was quoting a medical metaphor from Cicero); however, dissidents who practiced their faith quietly and peacefully should be tolerated.

In composing his *Politica*, Lipsius endeavored to produce a synthesis between the traditional mirror of princes and Machiavelli's *Prince*. While he supported monarchy and a moderate form of absolutism, he emphasized that this form of government should be based on Stoic virtues, and if the monarch abused his power, he was not to be killed but to be educated. Lipsius's monarchy was not grounded in the amoral despotism of Machiavelli but instead in Neostoic moral philosophy, which was the foundation of sound government: its precepts and doctrines would ensure that reason was always in control (Sénellart 1994).

It has been claimed that Lipsius's *Politica* "launched the anti-Machiavellian tradition of the Counter-Reformation" (Bireley 1990, p. 99). Certainly, the treatise was widely read and met with overwhelming success. Yet, it also provoked fierce attacks, from both Protestant and Catholic circles, and after returning to the Catholic

Southern Low Countries, Lipsius rewrote the *Politica* in order to meet the criticisms of the Roman Church. Lipsius's *Politica* was well-received: fifteen editions of the Latin original appeared in the first 10 years, from 1589 to 1599, and in the same period, it was translated into Dutch, French, English, Polish, and German. In 1604, Spanish and Italian translations followed, and in 1641, a Hungarian version was published. Up to the start of the Thirty Years' War, a new edition of the *Politica* was issued almost every year. The so-called Lipsian paradigm (McCrea 1997) – consisting of strong political views on discipline and order, absolutist monarchy, and on the unity of the state – inspired new and upcoming nations in the seventeenth century, including Germany, Spain, England, and Sweden (Oestreich 1982, 1989; Bireley 1990; Sénellart 1994).

Stoic Treatises (1604) and Seneca Edition (1605)

Lipsius worked on his major edition of Seneca's prose writings for many years (Papy 2002). A running commentary composed of short philological annotations and historical explanations guided the reader. A philosophical commentary would have been too complex for such brief notes, so Lipsius, at the end of 1602, decided to publish two monographs setting out a proper understanding of Seneca's Stoic philosophy and a clear historical and philosophical reconstruction of the Stoic school (Papy 2017b). Both works were published in Antwerp in 1604: the *Manuductio ad Stoicam philosophiam* ("Guide to Stoic Philosophy"), introducing the history and doctrines of the Stoic sect, and *Physiologia Stoicorum* ("Physical Theory of the Stoics"), dealing with its physics and cosmology. Lipsius planned, but never completed, a third work, to be entitled *Ethica* (Papy 2005).

Guide to Stoic Philosophy

In typical humanist style, Lipsius first meticulously collected and studied all the ancient Stoic sources available to him: Seneca, Epictetus, Cicero, Plutarch, Diogenes Laertius, Plato, Philo of

Alexandria, Apuleius, (pseudo-)Hermes Trismegistus, Sextus Empiricus, the Greek and Latin Church Fathers (above all, Clement of Alexandria, Tertullian, Minucius Felix, Lactantius, Eusebius, and St. Augustine), and later Christian writers such as Orosius and Isidore of Seville (Saunders 1955). He not only excerpted historical and philosophical material and doctrines but also demonstrated how Stoic philosophy had been present throughout the ages (Kraye 2007).

Lipsius began with a history of the most important philosophical schools of antiquity and then proceeded to discuss the origin and succession of the various Stoic schools, together with their different views on the definition and parts of philosophy (Isnardi Parente 1986). This led him to the definition of the wise man (*sapiens*): “he knows in a sense all the instances that fall under the universal” (*Manuductio* II.8). Following the view of the Greek Stoic Panaetius, Lipsius maintained that the wise man was a *proficiens*, that is, he was in a state of progress; as such, he studied physical phenomena and their causes, since, by paying attention to the laws of nature, it was possible to deduce the rules of conduct and the nature of good and evil. After the study of physics, moral training was essential: ethical precepts led to wisdom, but they needed to be reinforced by general doctrines. Lipsius did not accept the Stoic view that reason was the appropriate vehicle to comprehend God and nature. In line with Platonic thought and also more suitable for Christians, Lipsius stated that the capacity to understand God and his work (s) was a divine gift. Nevertheless, the road to wisdom was to be found by following the rules of conduct exemplified in nature. A good life is based on reason and virtue: reason understands the world and the supreme good; to live happily is to live according to nature and, therefore, to live according to virtue (*Manuductio* II.15). To Christianize this view, Lipsius drew on Seneca and Epictetus, concluding that it implied living according to the right reason or God (*Manuductio* II.16). The wise man obeyed God, and following his Christianized Seneca, Lipsius maintained that “we are born into a kingdom where obedience to God is true liberty” (*Manuductio* III.12). In a similar Christianizing

mode, Lipsius replaced the Stoic *logos* with the Christian *logos* or, as St. John had defined it, the “Word of God.” This identification of the Stoic *logos* with the Christian God paved the way for Lipsius’s important conclusion, echoing both Cicero and Clement of Alexandria: the Stoic supreme good was equivalent to faith in God and the right attitude toward God (*Manuductio* II.19). And since the *summum bonum* was located in God, the good did not exist in man until both he and his reason were perfected by virtue (*Manuductio* II.22). Still, the supreme good should also be *honestum* or morally virtuous. The image of Seneca’s *sapiens* was important to Lipsius: the wise man had control over himself (by the use of reason) and chose external things only when they were in accordance with nature and thus morally virtuous (Lagrée 1994; Papy 2019).

In his *Manuductio*, Lipsius gave an eclectic account of Stoic moral philosophy (Kraye 2001–2002, 2008). When required by the authorities of the Church, he cut and trimmed the message of the ancient Stoics; since not all their teachings were compatible with Christianity, he, for instance, discarded the Stoic doctrine of ethically indifferent actions (*Manuductio* II.23). Lipsius endorsed some Stoic paradoxes, especially those which could be easily adapted to Christian virtues such as humility: “that a kingdom should please the wise man no more than slavery” (*Manuductio* III.12). Others, however, such as the Stoic view that the wise man was, at his own decision, free to take his own life, were by definition unacceptable. Here, Lipsius invoked St. Augustine in order to Christianize harsh Stoic precepts (*Manuductio* III.22–23) (Papy 2001–2002).

Physical Theory of the Stoics

In line with Stoic doctrine, Lipsius regarded ethics and physics as inseparable: to live one’s life in accordance with nature was impossible without full knowledge of nature. In his *Physiologia Stoicorum*, Lipsius’s goal was twofold: to reconstruct Stoic views, within the framework of the doxographical tradition, on natural philosophy and to demonstrate the importance of natural philosophy for ethics and theology. Again, Lipsius

sought to harmonize the physical doctrines of the Stoics with Christian thought: by interpreting it allegorically, elucidating similarities between Stoic physics and Christianity, and by adopting a Neoplatonic “correction” to Stoic doctrines. Moreover, the investigation of issues such as the nature of God and the universal laws of nature was an ideal antidote to indulging in worldly quarrels, in which reason evaporated into nothingness (Hirai and Papy 2011).

Drawing on Stobaeus, who was quoting Aetius, Lipsius defined nature: “God is a craftsman- like fire proceeding methodically to create the world and containing within itself all the seminal reasons; then, in accordance with these, everything is constructed by fate” (*Physiologia* I.6). While the first part of Lipsius’s definition is fully Stoic, the second part, asserting that fire or God contains the seminal reasons (*rationes seminales*), ideas, or forms of all existing things, is derived from the Neoplatonic and Christian traditions. In a characteristically Neostoic interpretation, Lipsius compared this fire to Moses seeing the light glowing in the bush (Exod. 3:2) and the pillar of fire that leads the Israelites through the wilderness (Exod. 14:19). He even compared it to the burning tongues of the Apostles (Acts 2:3; *Physiologia* I.6) (Steuer 1901).

In like manner, Lipsius cited the *Corpus Hermeticum* when discussing Platonic “ideas” and their relationship to God: God was not only the divine fire of the Stoics but also the *spiritus igneus* (“fiery breath”) described by Posidonius and Hermes Trismegistus. Christianity, as Lipsius argued, had a similar idea: although God cannot be seen, everyone sees God daily in all things (*Physiologia Stoicorum* I.7, with reference to *Corpus Hermeticum* XI.16). The Stoics’ pantheistic equation of God with the world and their belief that the divine principle was corporeal were incompatible with Christianity and therefore not acceptable to Lipsius (Joly 1996).

God, as the world soul, permeated every living thing, and fate was God’s providential reason (Hirai 2009, 2012). Once again, Lipsius invoked St. Augustine to maintain that fate did not conflict

with God’s free will (*Physiologia* I.8–12). Fate caused everything, but not every action was a direct result of it. Moral liberty was thus safeguarded. Responsibility lay in the sphere of *causae secundae* (“secondary causes”). To resolve the problem of evil, Lipsius combined Christianity with Aristotle: even though the world was created by a benevolent God, deformed creatures and monstrosities – though seemingly contrary to nature – were in accordance with the overall plan of nature and divine providence (*Physiologia* I.13, with reference to *De generatione animalium* 769a–773a). In this way, Stoic conceptions of matter, body, and God – all of them incompatible with Christianity – were forced into Lipsius’s Neostoic framework. Yet, Lipsius did violence to Christian teachings when he defended the Stoic view of the soul as a vital *pneuma* (“spirit” or “breath”; *Physiologia* III.9). His humanist program, based on Christian ethics and Stoic doctrines, demanded inventive adaptations: in a world of religious wars and civic unrest, Lipsius promoted a philosophy of virtue, free will, and social engagement in order to achieve a Christianized *humanitas* which, though pagan in origin, would be acceptable to his contemporaries as well as practicable.

Lipsius’s Impact as a Historian of Philosophy

Lipsius’s two manuals on Stoic ethics and physics were first and foremost meant as an introduction to Seneca. Yet, his new synthesis of the doctrines elaborated by the Stoic school went further. Not intending to offer a new philosophy himself, Lipsius’s study of Roman Stoicism put on the table ancient concepts which remained usable: freedom, nature, reason, providence, and God. Europeans, seeking a new view of the world, rational behavior, and individual free will, eagerly adopted Lipsius’s Neostoic philosophy. Prominent writers were inspired by his Stoic studies: Guillaume du Vair, Montesquieu, and Pierre Bayle in France; Francis Bacon and Joseph Hall in England; and Francisco de Quevedo and Juan de Vera y Figueroa in Spain (Ettinghausen 1972; Carabin 2004; Lagrée 2010). Lipsius’s *Manuductio* and *Physiologia Stoicorum* immediately became classic works of Stoicism and remained authoritative for more than a century.

The most important histories of philosophy – Georg Horn, Thomas Stanley, Gerardus Johannes Vossius, Joannes Jonsius, Henning Witte, Johannes Franciscus Buddeus, Burckhard Gotthelf Struve, Christoph August Heumann, and Johann Jakob Brucker – all drew heavily on Lipsius's Stoic manuals, taking over their historical details, their wealth of ancient source material, and their acute philosophical analysis. In addition, Lipsius's treatises were in the libraries of Spinoza, Descartes, Leibniz, and Locke (Papy 2017a).

Abstract

The era of Abdul Rahman II in Cordoba (792 AD–852 AD) represents a pivotal stage in the history of Andalusian identity. It is in this era that Andalusians sought to move beyond the quest for stability and turned to the issue of self (essence) in an attempt to create a distinct Andalusian character independent of its Eastern counterpart. To showcase this mission, a general openness to knowledge and an increased veneration of the original sources of radiation in the East were seen as key prerequisites not only for reproducing this Eastern influence on the Andalusian character but rather to build upon it and transcend it. It was envisioned that this formula would create an Andalusian personality that is aware of its routes in the East but also constantly in pursuit of intellectual independence.

On the issue of openness to general and outside knowledge, a key turning point was the introduction of widespread and cross-continental translation endeavors that brought

foreign and often epistemic diverse cultures into contact. Central among these was the arrival of Greek philosophical knowledge, which proved attractive to certain key intellectuals. Despite the widespread acceptance of philosophical knowledge in Andalusia, not all those concerned in the evolution of the Andalusian intellectual history are acknowledged equally. This short entry is going to discuss the life and works of one of the often-neglected intellectuals whose philosophical works deserve attention. The entry will look at the life of Lisān al-Dīn Ibn al-Khaṭīb (Loja 1313–Fez 1374 AD). Specifically, Ibn al-Khaṭīb should be sought for his works in political philosophy, which is not surprising given that he was a statesman and ambassador. A brief account of his philosophical mysticism will also be provided before concluding.

Biography

Lisān al-Dīn Muhammad bin Abdullah bin Said Ibn al-Khaṭīb was born in Loja, one of the provinces of the city of Granada, which Ibn al-Khaṭīb himself described as “the girl of Granada” (Ibn al-Khaṭīb 1978). His father was a friend of the Nasrid family, and his family was one of the influential families in the city with its history going back to the beginnings of the Umayyad dynasty in Cordoba. He moved, when he was a child, to Granada and began his scientific career in its vicinity taking full advantage of the intellectual ambiance, which resulted from the fleeing of many Andalusians into Granada from the surrounding cities, which fell to the Christian armies. The galaxy of scientists and intellectuals who flooded Granada allowed Ibn al-Khaṭīb a diversity of intellectual sources from which he could draw inspiration. His studies and intellectual pursuits included religious, literary, linguistic, historical, and philosophical knowledge – making this century (the fourteenth century) the Golden Age of Bani Nasr (Ibn al-Khaṭīb 1978; Lirola Delgado 2004).

It is possible to discern two main strands in Ibn al-Khaṭīb’s philosophical thought: political and

mystic. Through these two, we can form a general picture of his philosophical knowledge at the intellectual and social levels.

Introduction

From Andalusia, we can talk about some who departed to the East and gained special Islamic knowledge regarding the controversy of philosophical knowledge, and the most important of these is Ibn Masarraḥ Al-Jabaly (883–931 AD). Al-Jabaly is considered by some as the leading Andalusian philosopher and one of the most prominent missionaries of the philosophical attitude in the new environment on the Iberian Peninsula. Sources point to the fact that his thoughts are informed by the principle of the *Itisal* (Contact God) and that these represented Gnostic tendencies, which led to the adoption of philosophical internist thought (Guerrero and Garrido Clemente 2006). It should be noted that the Andalusian philosophical thought – taking advantage of the Eastern experience – was open to the issues of governance, ethics, and behavioral aspects, all of which were covered by a religious dress hosted in an Islamic medium. This medium saw religion as the basis for understanding the universe. Additionally, religion was seen as the core tool to direct every aspect of life and human conduct, whether this received a pleasingly religious acknowledgment or was censored. In fact, rarely did philosophy win or come up favorably on this censorship or religious guardianship. Sound religious edicts were used like swords on the necks of philosophers. This at times took a literal sense, and those who didn’t lose their lives saw their lifetime works destroyed. Even in the latter times of the Andalusian era, prominent figures such as Ibn Rushd (1126–1198 AD) suffered from religious censors which led to the burning of his books and his eventual explosion from the grounds of the **Almohad**. Despite these persecutions, philosophical interchange and cross-continental influences continued to be demonstrated by Muslim scholars. We can provide an example with regard to this awareness of Andalusian/Eastern philosophy and Greek heritage influences. We refer to the

famous scholar Ibn Hazm (994–1064 AD) for whom the ideas of philosophy embodied his overall writings. Among these, the most important is the *Tawq Al-Hamama* (Dove Collar) in which Platonic love sentiments are clearly illustrated (Ibn Hazm 1967).

After that, and in spite of the persecution suffered by the philosophers in sporadic stages, the Andalusian characters' interest in the subject of philosophy increased; for example, Ismail Al-Ruayni (S.11 AD), Ibn Al-Arif (1088–1141 AD), Ibn Borjan (1078–1141 AD), Ibn Bajja (1139 AD) until Ibn Tufail (1185 AD), and Ibn Rushd (1126–1198 AD) all gained prominence. In particular, Ibn Rushd became one of the greatest commentators and assimilators of Aristotle's thoughts. Given the influence of Sufism, philosophy in Andalusia was frequently associated with mysticism, especially on the side of philosophical mysticism. Here, Ibn Arabi (1165–1240 AD) is considered to be the most prominent name. Furthermore, since Ibn Arabi, discussions around philosophical mysticism have been seen as coterminous with Philosophy proper and can no longer be separated from one another.

However, many of those who study Andalusian philosophy do not look beyond the thirteenth century, in the belief that it is a stage of general cultural decline with which no philosophical thought can be imagined to have existed – the assumption being that philosophy does not grow in the fall of civilizations. However, a contemplated pause for that stage accepted historically as the time of Bani Nasr (1232–1492 AD) may lead to change in this belief through the information about the knowledge of this era and its prominent names. This is especially so in the last 100 years (Arie 1973).

Of the most important of these recent names, Lisān al-Dīn ibn al-Khaṭīb (Loja 1313–Féz 1374 AD) appears as the polymath scholar that many people do not know. One of Ibn al-Khaṭīb's main tributaries of knowledge is a philosophy that can be drawn from his accomplishments, especially his political philosophy specifically, which is not surprising given that he was a statesman and ambassador. He produced multiple works which reflect his political knowledge, including poetry

and prose, which are the essence of his scientific and intellectual experiences. However, his oeuvre is not confined to or solely dependent on political philosophy but extends to the existential and religious philosophy as can be seen in his famous dialectical work *Rawdat al-tarif* (Garden of Definition), which blended Western philosophy with Eastern mysticism.

Ibn al-Khaṭīb has left a legacy of political ideas representing a careful digest of previous experiences and sincere contemplation of the surrounding atmosphere and environment imposed by the tense situation in Andalusia in its latter era which had entailed catching the middle of the stick with regard to diplomacy with the Christian neighbor in the north and the Muslim neighbor to the south. Also, growing up in surroundings in which the ideas of mysticism and philosophical mysticism had spread shaped special philosophical insights within his mind. This is especially so in the realm of his existentialism, human, and religious philosophy. It can be argued that it is perhaps this marrying of variant ideas that made him a victim, leading his name to be added to the names of the victims of thought and, specifically, religious thought. In the following passages, an attempt will be made to sum up his life and works as permitted by the allocated space.

Political Thought

As regards the political side of Al-Khaṭīb's philosophy, there is no doubt that the circumstances surrounding the variant members of the Kingdom of Nasrid necessitated the adoption of special and accurate policies toward the Christian neighbor and toward the brotherly Muslims of North Africa. Additionally, the need to adhere to these policies even in the case of the Nasrid House itself had a great impact on the steadfastness of the remaining parts of this Kingdom two and a half centuries before its collapse by the Reconquista at the end of the fifteenth century AD.

When Ibn al-Khaṭīb became a prominent statesman, he had inherited various political traditions preceded by the ministers of Bani Nasr and of Andalusia in general. These theoretical

inheritances either went back to the politics of the Islamic Eastern beneficiary clearly from its counterpart in Greek or were resultant of practical experience shaped by circumstances and events in Andalusia.

There is no doubt that Ibn al-Khatib, being a well-known versed encyclopedic scholar and because of the sensitivity of his position as a minister, must have received solid training in Islamic philosophy as part of his intellectual training. It is also natural for him to have been well versed in the heritage of Muslim philosophers such as Al-Farabi (874–950 AD), Ibn Sina (980–1037 AD), and philosophers who have imbibed the Greek philosophical heritage, especially in the spheres of government and the management of political affairs. This can be drawn from his writings, although nothing has survived from his works that help us to form an accurate picture of his initial sources in this regard, and if we would have in our hands his book *Bustan al-Duwal* (Orchard of the States) on, for example, arts of policy, justice, war, crafts, and public classes, we would be able to better understand his wider influences (Inan 1968).

On the practical side, there is no doubt that Ibn al-Khatib carefully studied the history, including the date of the neighboring Christian kingdoms that formed his political experience. He must have had a particularly acute understanding of Andalusian culture, in which he lived in its last stages and arguably most dangerous times. These experiences have been demonstrated in his works, and I may refer only to his collections of poetry, which listed the date of the Islamic policy, such as his long poem *Raqm al-hulal* (Garment Inscription) (Inan 1968).

Politically, there are many figures who can be counted among Ibn al-Khatib's influences and role models. However, chief among these and probably the most influential to Ibn al-Khatib's thoughts and political behavior is Al-Hajib Radwan Nasri (1359 AD), who was originally a captive boy from the Christian lands. During his captivity, he received his religious and political education in Granada. Excelling and proving himself a true intellectual, he grew prominent and began to be mentioned as a leader and military

expert. Specifically, as a military leader, he made the point that the most important means for the protection of the state lies in strengthening the defense aspects and strategic work. With this in mind, he worked on a very large fortification of the immediate grounds of the Nasrid Kingdom, which impressed Ibn Al-Khatib and influenced his own ways and thoughts. This reverence for Al-Hajib was indicated by the intensity of Ibn al-Khatib's deep sorrow on his death in the famous coup against Mohammed V (1391 AD). Members of the Nasri household who found Radwan's political prowess and influence particularly threatening carried out the coup itself. Ousting and killing him was a sure way to end what was feared to be his eventual takeover (Ibn al-Khatib 1985). The character of Al-Hajib can be counted, from my point of view, as the most important example of a practical politician that influenced Ibn al-Khatib in his ministry of Bani-Al-Ahmar.

Due to the lack of space allotted for this article, I will try to address the most prominent lightening points in the political philosophy of Ibn al-Khatib and link them with their causes, on the one hand, and, on the other, their sources with the aid of his texts that reveal his political thinking and behavior.

Balance Policy

This addresses the position that was taken by Granada as regards her Muslim and Christian neighbors alike. Granada's position as a small kingdom with limited military capabilities forced it to stand at the same distance from the neighboring powers (Torres Delgado 1974). The reader of the history of this kingdom may find that at times, Granada pursued policies of convergence and, at others, policies that secluded it from her neighbors, as required by its own interests. This said, Granada rarely in history stood alone without allies of the Christians or Muslims. But what matters here is to highlight the viewpoint of Ibn al-Khatib about these issues.

When Ibn al-Khatib became an important figure in the Nasri royal court, which started at the beginning of the second half of the fourteenth century, Granada was suffering the brunt of

Castile, ruled by King Alfonso XI (1311–1350 AD). Toward this imminent danger, Ibn al-Khatib made several visits to al-Magreb to solicit the sympathy of the Marinid state to stand with Granada against this king. And because the danger at hand was seen as one of the prominent propositions, Ibn al-Khatib as Granada's ambassador used the most effective means to influence the king of al-Magreb and grab his support. To do this, it was enough for him to recite his poem, which he delivered in front of the Sultan Abū Annān as he addressed him before giving the reason for the visit:

Oh Khalifa of Allah, may destiny help your glory
whenever the moon shines in the darkness

At that point, the Sultan granted his request before even mentioning it (Ibn al-Khatib 1989a; Ibn Khaldun 1996).

The impetus of Ibn al-Khatib was to be fully biased toward the Muslim neighbor, whom he saw as having a duty to respond given the circumstance of relative religiousness of the danger posed by King Alfonso. Ibn al-Khatib's saying in his book *Riḥanat al-kuttab* (Writers Basil) illustrates to what extent this policy was employed:

While the infidel nations crumbling for their falsehood religion,
to whom then shall we resort, but to the people
of that country [al-Magreb]. (Ibn al-Khatib 1980a)

But when Alfonso XI died and was succeeded by his son, Pedro I, we find that the policy of Granada is moving toward reconciliation with Castile, and that is why the Nasri ministers and elites sent candles and condolences to Pedro at the death of his father. The rulers in al-Magreb did not respond well to this, and Fez criticized Granada's stance in paying tribute to Pedro. When this happened, Ibn al-Khatib defended Granada without losing Fez's alliance with his wisely chosen words:

we are just paying it as a tradition to protect ourselves from evil. (Ibn al-Khatib 1980a)

The policy adopted by Ibn al-Khatib resulted in a strong alliance with Castile, and fame to the Minister of Granada in Spanish sources, and among Christian ambassadors. With Ibn al-Khatib frequenting the homes of all the

prominent emissaries and ambassadors, he was, in essence, the *de facto* ruler in Granada politics, and he was really the most competent person to work with a balanced policy with all parties (Simonet 1872; al-Abbadi 1973). The balanced policy of Ibn al-Khatib helped to return the deposed Sultan to his throne by King Pedro and helped him to build a strong friendship with Castile. This can be tracked and proved through the writings of Ibn al-Khatib while singing praises and prayers for Pedro (Ibn al-Khatib 1989b).

The balance mastered by Ibn al-Khatib with all parties pushed Mohammed V to insist on Ibn al-Khatib's presence out of exile to assume the ministry after he had gone into hermitage in al-Magreb. This is evidenced by the accounts narrated by himself in *Nufadat al-Jirab* (Residual of the Sadlebag), while the second coup took place in Granada, where he speaks of how he helped in the discussion with the revolutionists to put down the revolt. Mohammed V asked his advice when insurgents besieged and made him tremble. Ibn al-Khatib's advice was to stay at Alhambra and stay away from the rebels and their discussion – leaving them all to him (Ibn al-Khatib 1985). All of this falls under his policy of balancing that Ibn al-Khatib used to come to the correct position after examining all sides and forces around him (Ibn al-Khatib 1989b, 1980a).

Granting Legitimacy to the Sultan

As noted above, the conditions of emergency inside the Kingdom of Granada and its political position filled politicians with many fears. It is not only the external enemy that the Alhambra sultans feared, there was also a fear of its subjects. The Kingdom of Granada suffered a lot of internal conflicts, which continued and caused the eventual fall of Granada. Although there are many reasons and causes that inspire revolutions against the ruler, in the case of great weakness experienced by Granada, it seemed as if the most important of these reasons that deprive the rulers of their legitimacy is their failure as protectors of Islam. This topic had already been addressed by Ibn al-Khatib in the history of the wider Andalusia, but he sensed its danger particularly in the Granada stage for the reasons that we have

mentioned, such as their weaknesses in fulfilling their Islamic duties.

Ibn al-Khatib saw the ruler as Khalifa of God and a shield of Islam against God's enemies. In this regard, specifically, we will find that al-Khatib presents Castile as an enemy of religion in the first place and that the conflict with him is – although it is in fact a conflict of political interests not a clash of religions – a conflict between Islam and Christianity. For him, the image of the ruler is the image of the defender of religion and thereby mobilizer of public support for its defense. And terms such as “cross,” “Cross-worship,” “fetishes worshipers,” “infidels,” “Christ and Mary worshipers,” “filth,” etc. abound in the writings of Ibn al-Khatib and his mass speeches. Additionally, this sort of discourse helped a lot in conferring an aura of sanctity and legitimacy to the Nasri ruler. Examples of this discourse are sayings such as “Our prayers on the Prophet Muhammad, in whom we hope to win over the servants of the Cross” (Ibn al-Khatib 1980a) and: “We ask God to unite the word of Islam against the fetishes worshipers” (Ibn al-Khatib 1980a).

The Policy of Internal Governance

The subject of domestic politics and the art of governing the people are the key topics that greatly concerned the Andalusians and Orientals policymakers. Having inherited great precedence from the thoughts of ancient oriental philosophies and Greek philosophy, especially the idea of utopia, civil policy became widespread among Muslim philosophers especially Andalusians in their latter times. As we will see shortly, Ibn al-Khatib in this particular aspect excelled over his contemporaries. Among his texts, which showcase this, is the famous political advice poem that he wrote for Sultan Mohammed V upon his return to the throne after the coup that briefly deposed him. The poem included advice on the best way he should govern, push and pull policy, and how he should conduct himself with his ministers and others. An extract reads as follows:

If you need to consult, speak with the wise,
because talking with the ignorant is not
recommended
If you punished someone once

Replace him with others
Accept the advice of those who come to you.
Thank him even if he is a liar and a fraud
Don't show humility in adversity if they come
As much as shown, people don't respect you.

(Ibn al-Khatib 1989a)

The second text through which we can see something of the political thought of our minister is the text of his speech on politics. The topic of this speech is the insomnia of Caliph Harun al-Rashid and his request to bring him whomever they find in the streets, and they brought an old man of Persian origin with a simple appearance, but wise. The Caliph starts by asking him about governance, and the old man (*Sheikh*) offers his view of political art. Al-Khatib ends his tale comically, in which the old man plays a recital of music, while the Caliph and his Counsel sleep. The old man then unsheathes himself and leaves. It is obvious that in this *maqama* (prose story based on the rhyme and irony style) Ibn al-Khatib is influenced by Iranian philosophy. Additionally, he clearly takes inspiration from Caliph Harun al-Rashid character and holds that under his rule, the Abbasid state had reached the height of cultural production, which is clearly illustrated by the myths and stereotypes that were transmitted to us in the stories of *A Thousand and One Nights*. Furthermore, the fact that the hero of Ibn al-Khatib's speech was an old simple Persian and not a simple Arabian, indicates his appreciation of the Persians and their philosophy of governance, which is justified in view of the Persian civilization that prospered before the civilization of Islam and their (the Persians) role in the establishment of the Islamic state.

There is no doubt that the selection of a template of *maqama* potentially bears several things, including being an endeared template for the education of governance and delivery of significance, where repeated assonance and narrative template are attracting factors that help to spread the idea and education as opposed to abstract philosophical reasoning. From the ideas of Ibn al-Khatib in his work, it can be concluded that the political agent must make himself fit for the task at hand and purifies his soul before reforming his subjects. For Ibn al-Khatib, the

Sultan needs to take special care to rectify imperfections, leading by example. The appointment of Ministers with good character and from respectable backgrounds is also seen as key. Additionally, a special assignment is allocated to some whose role is to keep an eye on these ministers gauging their usefulness to the Sultan and the state as a whole. Ibn al-Khatib also thought that the Educational Policy of the Sultan's sons must be geared toward developing rigor. This was in opposition to the encouragement of over companionate mercifulness which he believed would lead to poor and lazy educational outcomes. Rigor and even fear, in his mind, were seen as sure ways to attain good discipline breeding (Ibn al-Khatib 1980a).

It is also worth pointing to another source of Ibn al-Khatib's political thought, his work entitled *Al-Ishara ila adab al-siyasa wa l-wizara* (Reference to the art of Politics and Ministry). This work imitates *Kalila and Dimna* or *The Fables of Bidpai*, which is a famous work attributed to Ibn al-Moqaffa in which he passed many political pearls of wisdom, taking animals as a symbol for that. We are not in the process of comparing this work with that of *Kalila and Dimna* or the art of *maqama*, but we can identify some of the political outlooks which are justified by our minister. Ibn al-Khatib titled his work with *adab* which means "principles." There are some books that contain the word *adab*, such as "*adab* of writer" and "*adab* of writers." These are understood to be works written by experts in the fields, which means that Ibn al-Khatib saw his position as a teacher of the art of politics. It also relates to his role as minister, and this is a feature of the importance of his position with regard to politics. The ministry in one way or another means the actual governance of the state (Ibn al-Khatib 1980a).

In his famous fable *On the Tongue of the Tiger* (in this fable a tiger talks), we see Ibn al-Khatib passing a lot of his ideas, such as recipes of successful ministerial conduct and what one can bequeath his ministry. Here Ibn al-Khatib conveys a story about ministers of Greece and how each one of them was choosing an intelligent woman to procreate with, and after specific

rituals for her to give birth to an intelligent son who could be his heir and take over the affairs of his ministry. For Ibn al-Khatib this was one of the bases of ruling because he saw the good minister as one of the foundations of a well-organized good state even when the ruler is weak. It can be argued that this insight derives from a firsthand experience, which Ibn al-Khatib gained in his capacity as a minister. Here Ibn al-Khatib has been monitoring the six pillars of the underlying commandment of a ministry, such as dealing with the Kings, according to the nature of each and every one of them. He also refers to certain qualities that can be found in the King but not in the minister. These, for him, included things such as chastity, and the concern for the wellbeing of the state.

The Policy of Self-Interest

This section on the policies of Ibn al-Khatib is very broad and contains many texts. The primary reason goes back to his position as a statesman who found himself surrounded by rivals and competitors, prompting him to take care to maintain his personal interest. This sense of self-interest toward an end made our minister follow the Machiavellian principle that the end justifies the means; he sometimes followed non-ethical means to get those interests. Of the many examples that can be viewed in this regard, is his position toward the sultanate of Beni Marin in al-Magreb. Ibn al-Khatib was close to Sultan Abu Salem (1359–1361 AD), who was credited with the extraction of Ibn al-Khatib from prison in Granada after the coup against his king. Sultan Abu Salem was also credited with the recovery of his money and gave him exceptional hospitality in al-Magreb. When the Sultan was killed and al-Magreb was taken over by a new sultan we find that Ibn al-Khatib heading to the new ruler, congratulating him and disparaging the Sultan Abu Salem. Although this can be seen as unethical and not justified, it can be better understood as the logic of personal interests in the policies of Ibn al-Khatib, who knew very well that he might come to need the new sultan in the near future (Ibn al-Khatib 1985).

Spiritual Philosophy

The second field in which we can find Ibn al-Khatib playing a key role is that of philosophy of mysticism. When we connect philosophy with Sufism, this is a way of mentioning the particular after the general. That is, the philosophy of mysticism is part of the philosophy generally, and it is in al-Andalus, especially in later times. In these times, society was directed to look at many aspects of life with the knowledge that, as we have said previously, religious thought was generally dyed or intermingled with the philosophical position of the Muslim community, who saw religion as an integral component of all types of philosophy and its branches.

Therefore, when dealing with the philosophical mysticism of Ibn al-Khatib, we are actually touching on his philosophy in general, especially the headwaters of the philosophy he has – Sufism and others – almost one assemblage between Greek and Islamic heritage. In a nutshell, we cannot do justice to all of his philosophical thoughts on and of Sufism, since it is a wide topic, but we will try to give a general idea of some of the most important elements of his ideology.

The legacy of Lisān-Dīn Ibn al-Khatib is a great reflection of his knowledge of mysticism and philosophy at several levels. In his production of poetry and prose writings in general, and in different cultural contexts, one often finds signs of his mysticism. In this regard, we cannot lose sight of the popularity of his famous book *Rawdat al-tarīf*, which is the most important source for us to see his philosophical questions on existentialism. It has also to be said that this is the book that brought about his trial and eventual death under the pretext of heresy.

The *Rawdat al-tarīf* book was in response to the book *Diwan Al-Sababa (Diwan of the Love)* of Ibn Abi Hajalah (1375 AD). This was a book on earthly love, in which Ibn al-Khatib wanted, and was asked, to emulate and oppose a book about mystic love. The theme of mystic love is a core issue in his book, which led him to talk about other philosophical issues that had been a cause

of resentment to him. The issue of supreme love makes him sympathize with those philosophers and mystics such as the “Mu’tazila”:

Love drives them to each argument
and love put them on hell razor. (Ibn al-Khatib
1989a, 1968)

In this poetic verse, the poet tries to vindicate their position and say that they may have been motivated by supreme love – which in turn put them in a banned category. Ibn al-Khatib leaves judgment for others and seems to suggest that perhaps the likes of the Mu’tazila may have been wrongly judged. With this justification, and throughout the book in question, we find Ibn al-Khatib attacking those who claim that some of the philosophical ideas contrary to the Islamic faith, such as pantheism, have no basis, but are rather directed and come from what he calls “roots [that are] malicious” (Ibn al-Khatib 1968). But reading one sentence of his writings proved otherwise because he believed these thoughts. Let’s, for example, read about the divine self, which smells of pantheism:

There are many words but the meaning is one
All became single that was passed by double.
(Ibn al-Khatib 1989a, 1968)

He then goes on to say, while commenting on the above verses: “If this was proven, then what use of multiplicity in words and why it fills up much of the ink?” (Ibn al-Khatib 1968).

In my opinion, interpretation is what resolves the contradiction in his writings, that is, Ibn al-Khatib sets forth a different interpretation of these ideas from what is understood by the public and the clergy. This difference is a matter of both form and content and is a significant philosophical matter we find with many of his countrymen such as Ibn-Sabien (1270 AD) and Ibn al-Arabi and others who justified the issue of love for them, as noted above. This dualism in the philosophical thought is old and goes as far as philosophy itself and is present in the thought of Ibn al-Khatib. It is a complex but perfect idea that looks at existence in a fundamental way. We can find manifestations of this idea in many of the writings of Ibn al-Khatib and in different

contexts, including his saying about his friend's disease: "Good of souls is a corruption of the body."

Conclusion

At the conclusion of this quick overview of the philosophical thoughts of Ibn al-Khatib, we can say it is an abstract of Andalusian and the philosophical thought of it in particular. He certainly took full advantage of his inheritance of the Eastern and Western traditions, which is reflected in his vision of his surroundings, religious works, political undertakings, and own conduct throughout his life.

Abstract

Michael Hermodoros Listarchos (ca. 1500/1505–1570/1577) was a prominent post-Byzantine intellectual figure. His greater

contribution is considered to be the education of young men who later became distinguished scholars in Western Europe. In his teaching, he appears to have promoted philosophical learning and new approaches to various philosophical theories. He emphasized the importance of philosophy in a period when intellectual activities and philosophical studies in the Greek-speaking Ottoman-occupied world were following a more traditional direction in comparison to Western European trends.

Biography

Michael Hermodoros Listarchos hailed from Zante (Zakynthos), a Greek island in the Ionian Sea, his father's name was Philippos, and he had two brothers, Andreas and Peter. His date of birth is placed between 1500 and 1505. The surname Listarchos, which in the Greek language means the "leader of robbers," caused Theodosios Zygomalas to ask "Is [Listarchos] the leader of robbers?" before he proceeds to explain that he has rightfully received the agnomen, for "he was a robber and a destroyer of vice and ignorance" of young men, referring to his teaching activity (Crusius 1584; Legrand 1885a). Yet it appears that Listarchos was in fact his family name (Mustoxidis 1847; Mpoupoulides 1959a). His first name was Michael, and Hermodoros was a name he adopted at a later stage in his life. "Hermodoros" is most probably an allusion to the Greek god Hermes, the protector of robbers (Mustoxidis 1847). Information about his life is scarce. At an early age, he left for Italy to study (ca. 1514–1521) at the Greek School of Rome under Ianos Laskaris (ca. 1445–1534), and then to Ferrara to study medicine. After the end of his studies, he returned to Greece and decided to settle down on Chios (Legrand 1885a, b). There, he practiced medicine and periodically served as a teacher to the youth of the Aegean islands (1533–1564). While he was in Chios (1539), Listarchos sent a letter to the humanist Guillaume Budé (1468–1540) praising him for his interest in classical Greek (Budé 1574). He

left Chios for Italy for a few years (1534–1539? and 1543–1546). He went to Rome (1544) and then to Ferrara, where he taught Greek at a local school. He was urged by Ecumenical Patriarch Dionysius II (1546–1556) to leave Italy in order to teach at the newly established Patriarchal school in Constantinople. Listarchos refused, but went to Constantinople a few years later at the behest of Patriarch Ioasaf II (1556–1565), for whom he was acting as a physician and advisor. It is possible that he taught at the Patriarchal school (Gritsopoulos 1966). Listarchos returned to Chios in about 1560, where he possibly remained until his death, although no specific information exists about him after 1564. His death is placed between 1570 and 1577 and before 1581, according to evidence found in epistles (Mpoupoulides 1959a).

Chios was an important educational and cultural center. Listarchos contributed with his teaching activities to its advancement in the sixteenth century and produced a number of students. His extensive correspondence attests to his relations with students and other intellectuals, such as the scholar, teacher, manuscript copyist, and *megas rhetor* of the Patriarchate of Constantinople Ioannes Zygomalas (1498–1584) and his son the scholar Theodosios Zygomalas (1544–1607) (Rhoby 2009). Listarchos was well versed in classical, patristic, and Christian literature and wrote a number of texts dealing with several subjects, in both Greek and Latin. In a hortatory epistle (1562) addressed "To those clever and noble youths who partake in and are taught Greek lessons" (*Tois ta Hellenōn metiousi kai didaskomenois mathēmata neois eyfyesi te kai eygenesin*), Listarchos emphasized the importance of wisdom, truth, knowledge, and faith as means of moral and intellectual improvement. The epistle was written at the request of Ioannes Zygomalas, it was later altered by Theodosios Zygomalas and sent to the humanist Martinus Crusius (1526–1607) (Crusius 1584; Mpoupoulides 1959a; Gritsopoulos 1966). Listarchos was interested in philosophical learning, and as he states "true philosophy is the only medicine [that can cure] passions" (Listarchos

1963). No philosophical works by Listarchos are known. His letters, and especially those he exchanged with the Peloponnesian clergyman and *megas rhetor* of the Patriarchate of Constantinople Theophanis Eleavoukos (d. 1560), are a valuable source of information about the study of philosophy in Greece in the sixteenth century. Eleavoukos criticized Listarchos' ideas and teaching methods in a discourse entitled *Reproach of those who are uninstructed in the use of reasoning or against Hermodoros* (*Elechos kata tōn apaideutōs xrōmenōn tois logois ē kat' Hermodorou*) (Eleavoukos 1981–82). There he offers an evaluation of philosophical studies in Greece and expresses his disapproval of philosophers-teachers, because, as he notes, they had partial knowledge of Platonic and Aristotelian philosophy and were a threat to the Christian faith. In light of Eleavoukos' accusations, it could be assumed that Listarchos most possibly adopted in his teachings novel approaches to Aristotelian philosophy which at that time were flourishing in the West. Listarchos, therefore, appears to have followed the intellectual tendencies of Renaissance scholars, at a time characterized by “the insistence of the vast majority of the Greek scholars to remain faithful to the traditional approaches in philosophy” (Steiris 2009). Thanks to his contacts with the West, Listarchos also facilitated the acquisition of books that were difficult to find in the East (Rhoby 2009).

The impact and legacy of Listarchos' teachings are evidenced by the fact that his students became distinguished scholars, “wise men, doctors and teachers” as Theodosios Zygomalas states (Legrand 1889). The success of Listarchos' students, many of whom engaged in the study of philosophy, indicates that he has provided them with high-level education in Greek letters and philosophy, at a time when education in Greece focused on scriptural teachings (cf. Crusius 1584; Steiris 2009). Listarchos was a purveyor of new philosophical approaches, especially of Neo-Aristotelianism, and paved the way for the new directions philosophy would take in Greece in the seventeenth century with Theophilos Corydalleus.

Literary Societies Outside Italy, Renaissance

Arjan van Dixhoorn

University College Roosevelt, Utrecht University,
Middelburg, The Netherlands

Abstract

Traditionally, the rise of a formalized academic culture in Europe, that is, of a culture of the arts

and sciences practiced in voluntary associations outside the universities, has been traced back to informal assemblies of Italian humanists in the later fifteenth century. However, throughout the urbanized zones of Western Europe, from Spain in the South to the Low Countries in the North, forms of organized literary sociability preceded the rise of the formal Italian academies in the 1520s, sometimes by as much as two centuries. The study of these older associations, often strongly agonistic and modeled on literary performances in public feasts and private banquets, reveals various organizational clusters typical of certain regions and cultural zones. These clusters, which sometimes interacted with each other, differed significantly in detail, but they had in common that they were formal organizations of (regional) cultures dedicated to the liberal arts (and sciences). Far from the learned associations that furthered erudite work or scholarly training, these organizations were dedicated first and foremost to literary performances as exercises in personal virtue in a way that was reminiscent of the "spiritual exercises" of antiquity. According to Caradonna (2012), the eighteenth-century French academies had borrowed their practice of prize questions from the *Jòcs Florals* (Floral Games), organized by the *Consistori del Gay Saber* of Toulouse, established in 1323, which was reconstituted as the *Académie des jeux floraux* in 1694. This fact underscores the need to include these "proto-academies" (with the performative literary culture they shared with most of the Italian academies), as a form of vernacular, everyday philosophical life, in the history of Renaissance philosophy.

Heritage and Rupture with Tradition

"Academic" or Convivial Practice Before 1600

"Academy" is a modern term of reference used in the history of philosophy and philosophical culture to characterize forms of philosophical sociability. The term is employed so widely that, from the viewpoint of social and cultural history, it has

become quite meaningless. It has been, and is still, used in relation to universities and their culture: For example, it has been argued, through a critical study of the sources, that Marsilio Ficino's famous Neoplatonic academy equated the Florentine Studio or university or at least its scholarly community (Hankins 1991). The term is also attached to assemblies of scholars and *literati* outside the university. Often, these groups have been awarded a role in the history of science and philosophy, as sites where humanists and later the proponents of the new science congregated to discuss novel ideas and perform experiments, in opposition to the supposedly sclerotic, noncollaborative scholastic world of the universities (see however De Ridder-Symoens 1996). A similar historiographical tradition developed regarding the third important use of the term academy, referring to the new groupings of artists, outside of the rigid system of the guilds, which helped to raise the visual and performative arts to a philosophical status through their association with the liberal arts, as opposed to the mechanical arts and manual labor status of the guilds. The fourth use of the term academy occurred in the context of the training of gentlemen, in the new military schools of the early modern world (see Garber and Wismann 1996 for these various usages).

From the Royal Society and the French royal academies to the numerous national, provincial, or local academies and societies engaged in promoting the arts and sciences (including the military arts), the origins of these forms of learning or education have been traced back to Italy and its Renaissance academies. As a result, most scholars adhere to an established genealogy, moving from the revival of ancient philosophical practices of the *convivium* among late-fifteenth-century Italian humanists (in particular, Ficino and his legendary academy), to the first institutionalizations of vernacular *literati* cultures in the early sixteenth century, from humanist academies to those of the new science, and from the Italian academies to those of France and to the academies and learned societies of the rest of Europe. Academy, as a term, has been used generically, even though many of these organizations or groups (from the Italian humanist circles to the Royal Society, and many others), in

particular outside the Romance-speaking world, did not call themselves academies, preferring instead a vernacular or Latin variant such as "society," "company," or "college." While the term academy has been liberally applied, suggesting a single genealogy for a large variety of groups and institutions, most of the organizations involved in literary culture in the vernacular outside of Italy, before 1500 and often even before 1400, were never called academies. These organizations have also been regarded as medieval and, more often than not, omitted from the canon of Renaissance culture. The more we learn about these "older" forms, however, and the more we study them from a European, comparative perspective, the less convincing the existing genealogy becomes (Van Dixhoorn and Sutch 2008; cf. Garber and Wismann 1996; Clark 2001; Everson et al. 2016).

This is not to say that Italian academies did not play a leading role in shaping a novel "academic" experience in Europe by providing a new model for learned and educational institutionalization. Yet, while some Italian academies (especially in cultural capitals like Padua, Venice, Florence, and Rome) certainly did play such a role, the early academies of the 1520s and 1530s, as well as most of the later ones, followed a different model that was similar to the "older" forms of other European regions. Despite a lack of a systematic comparison of the practices of all local Italian academies, it has been firmly established that the sixteenth-century literary, scientific, and artistic academies in Italy were commonly defined by various forms of conviviality or philosophical sociability (Cochrane 1961; Samuels 1976; Bryce 1995; van Dixhoorn and Sutch 2008). Rather than this being an invention of Renaissance Italy, these academies must be seen from a pan-European perspective, as forming part of the larger history of symposium-like practices, which also include the many earlier and contemporary non-Italian forms of conviviality (Jeanneret 1991). It has also long been established that the rise of the prototypical scientific academies around 1600 poses a new problem in the study of a *longue durée* of early modern conviviality, which, it can now be argued, extended from the 1200s through

the 1600s (van Dixhoorn and Sutch 2008; McClellan III 1985; Caradonna 2012).

Within these chronological limits, the question should then be: What forms of conviviality can be identified, and what are their historiographical traditions? To what extent and how can they be related or made comparable? How can these forms be positioned in a European history of everyday philosophical sociability? To what extent, and how, does such a study nuance existing Italy-focused interpretations of the origins of “academic” culture in Europe at large? And in order to do justice to the current themes in historiography: Why were some Italian academies given such a prominent role while others and particularly other non-Italian regional clusters were sidelined? Or, to put it differently, why has the history of European conviviality before 1600 not received attention in the study of European late medieval, and early modern philosophical culture that (some of) the Italian academies have? And what exactly changed when the older “festive” forms of conviviality were reduced, marginalized, or simply eradicated in favor of a new, more “scholarly” model? (Beam 2007; Werner 2008; Baldriga 2008; Van Dixhoorn 2009). What were the models for the change and to what extent were Italian experiences influential? These are questions to be answered in the future; but at present, the role of the *litterati* cultures in Europe outside of Italy needs to be established before the emergence and dominance of the new model can be understood.

Forms of institutionalized conviviality other than Italian academies have had no place in any history of medieval or Renaissance philosophy until very recently. To be sure, the place of the academies, apart from a few famous examples, in such history also remains unstable. What is more, with few exceptions, the history of the Italian academy as a social and cultural movement and as the institutionalized form of cultural practices remains largely untold, with the focus still largely local or at best regional (with Florence and Tuscany as the most famous examples) (Maylender 1626–1930; Yates 1983; Garber and Wismann 1996; Testa 2015; Everson et al. 2016). Given their rich historiography, the Italian academies

warrant a separate treatment, and comparison will only make sense after their European predecessors (not necessarily their ancestors) have been established as a topic in the history of Renaissance philosophy. This will not be an easy task, given the pivotal role awarded to Italy in any history of the Renaissance as a form of cultural upheaval.

One of the problems facing such an integration is the lack of interest in the content of texts that were produced by these forms of conviviality. The reason is simple: there can be no doubt that the individual items that have survived pale against the texts of the great philosophers or philosophical traditions. Very much like the works of most Italian academies, these texts only become interesting when they are seen as forms of practice, not as carriers of fascinating philosophical content. In other words, they represent “little traditions,” rather than the “great traditions” of philosophy (Burke 2009). They represent a “playful” culture (Lavéant 2011; O’Callaghan 2007; Winston 2016), a culture that was also largely vernacular and everyday. No doubt these forms of conviviality created a “second life” (Bakhtin 1984), but one that was fully integrated into the lives of its participants and audiences in its civic, mostly urban, settings. Its playfulness shows in the ceremonial, ritualistic, agonistic, often also festive and comical, or farcical, and always performative nature of these assemblies, mostly enacted by and for “ordinary people,” rather than for powerful patrons by professional *litterati* and/or performers. At the same time, these assemblies and their ordinary patrons were deadly serious about the identification of their exercises with traditions of learning, wisdom, or arts and sciences. In that sense, they can be seen as perpetuating or perhaps more accurately rejuvenating and adapting the ancient traditions of philosophy as a way of life, through “spiritual exercises” or “therapies” (see in a different context Nussbaum 1994; Hadot 1995; Jones 2006). Hence, in this entry, the focus is not on philosophies, but on everyday philosophical exercises, in the context of vernacular institutions and assemblies, outside Italy, between 1200 and 1600 (the 400 years of urban revival, and two cultural Renaissances in Europe). Given the state of comparative research into these earlier

“academic” traditions, the ideas presented here are preliminary, and the claim to philosophical relevance is controversial (van Dixhoorn and Sutch 2008; Van Dixhoorn 2018).

Since conviviality largely takes place in small group settings, the fundamental problem facing any history of sociability applies: Face-to-face meetings normally leave few archival traces. In the context of the history of conviviality, record keeping of meetings might be limited, but since philosophical sociability requires forms of speech, transcripts of spoken interventions, especially by memorable members or of memorable events, might survive. With respect to premodern European conviviality, the more elevated forms of speech during meetings were delivered in poetic form (using rhyme, rhythm, music, and dialogue). These poetic speech forms were often scripted, and in theory, such literary texts could survive as records of the meetings for which they were prepared and set down in writing. Yet, the survival of such records of ephemeral literature is strongly contingent on either the record-keeping of the poet (personal manuscripts) and his or her family, and/or the communal record-keeping practices of the group. The likelihood of the survival of such records is much higher if the group continued in existence after the demise of its founders and was interested in establishing an internal and sometimes external memory of its legacy. In other words, the chances of finding sources for convivial practices in premodern Europe are higher when they took place in institutionalized communities or formal organizations.

Institutional forms of conviviality can also be expected to be more likely to engage in record keeping in general, to come into contact with the law, and to engage with larger audiences. A public, relatively open, institution, as opposed to a private, relatively closed, group also stimulated further internal record-keeping practices and recording in a wider web of related institutions. They were also more likely to become a topic of interest for chroniclers. Finally, members of institutionalized communities were more inclined to keep records of their own contributions and to manage their legacy for future generations. Consequently, the study of the more institutionalized

forms of conviviality is likely to reveal the most comprehensive understanding of premodern conviviality. Such forms are the obvious object of study and transregional and cross-cultural comparison. Yet, they also only represent the most sophisticated expression of a much larger phenomenon.

Cultural Zones, Regional Clusters

If, in defining the object of study, we apply the set of criteria of associations of nonprofessionals engaging regularly in literary and theatrical performances in (private) playful meetings or on (public) festive occasions and often organizing regular contests, we can identify a few cultural zones and regional clusters across south-western Europe. To a large extent, these clusters and zones overlap with vernacular regional communities rather than with modern nation-states. They seem to have developed from older, professional vernacular literary practices, often connected to the courts. Hence, the *trouvère* culture of the northern *langue d’oïl*, the troubadours of the *langue d’oc*, and the *Meistersinger* of southern German-speaking courts were appropriated in the new, civic, and virtuoso institutions, either directly (through personal contact) or indirectly (based on interpretations of collections of texts or the cultural memory of oral transmission). As a result, the early literary associations also continued features of the older, professional cultures: links with (clerical) traditions of learning, social critique, musical culture, and a taste for competition (van Dixhoorn and Sutch 2008 and the references below).

The oldest regional cluster – the poetic contests of the *Puy* (i.e., podium) – originated between 1200 and 1400 in the linguistic zone of the *langue d’oïl*, which geographically includes today’s Walloon region of Belgium, northern France as far south as Burgundy, and (Anglo-Norman) England. The *Puys* have not yet been studied from a transregional perspective; no historian has undertaken an in-depth study of the history and function of these institutions, their practices, discursive traditions, and their members’ (literary) careers and networks. Consequently, what is known about them (largely) comes from literary

scholarship, which lacks historical precision regarding the institutional and cultural context. Nevertheless, it seems safe to assume that the first confraternity of the *Puy*, dedicated to the Virgin Mary, was founded in the city of Arras at the time of Adam de la Halle. A citizen of Arras, servant of the counts of Artois and Anjou, cosmopolitan diplomat, scholar, *trouvère*, poet, and playwright, he lived in the second half of the thirteenth century and can be considered the founder of the northern French civic literary, musical, and theatrical tradition. When around 1300 the short-lived London *Puy* (Sutton 1992) was founded, it was modeled on the *Puy d'Arras*; ironically, the first statutes of a *Puy* that have survived are those of the London *Puy*. Most other *Puys* are of a later date, largely from the late fourteenth century, including the famous *Puy d'Amiens*, founded in 1388. Between 1300 and 1600, foundations of confraternities of the *Puy* have been attested in Arras, London, Dieppe, Caen, Paris, Amiens, Rouen, Beauvais, Lille, Douai, Évreux, and Valenciennes; some of them were short-lived, and others created long-standing traditions and important cultural legacies that have survived in churches, archives, libraries, and museums (Gros 1992; Hüe 2002; Reid 2008; Symes 2007). Some of the French confraternities were turned into academies in the late seventeenth and eighteenth centuries (Caradonna 2012).

The second regional cluster, which is even more difficult to locate geographically, can be found in the linguistic zone of the *langue d'oc*. At its origin and center is the famous and well-documented *Consistori del Gay Saber* of Toulouse, founded in 1323, whose long-term history remains understudied from an institutional and socio-cultural perspective. This institution with its annual contest of the Floral Games and its theory of rhetorical practice became highly influential: Its theory of rhetorical practice was a discursive model in the northern French-speaking literary cultures, and its annual contest was an organizational model in the Occitan-speaking world as far south as Barcelona (in 1393 Juan I of Aragon is reported to have established a *Consistori de la Gaya Ciencia*) and Valencia

(where around that year the first poetic contest in Occitan was held, possibly related to another *Consistori*). The histories of the consistories of Barcelona and Valencia have been ignored (possibly because of a lack of sources) even more than the Toulouse model, which is relatively well known, although fragmentary, and compartmentalized in the traditional periodization between medievalists and early modernists. Whereas we can deduce that the northern traditions must have been inspired by the older *trouvère* culture, the Toulouse consistory explicitly appropriates three traditions existing within the city: the intellectual realm of the university, the political realm of the city, and the literary realm of Occitan troubadour culture. It is also the institution which is most explicit about its claim to create a vernacular convivial tradition based on a love of knowledge. In creating its discourse of the *seconde rhétorique*, as the vernacular equivalent to the ancient traditions, the Toulouse consistory clearly influenced the philosophical ambitions of the entangled literary institutions and cultures of the French – and the Flemish-speaking north (Kendrick 1988, 2008; Schneider 1989; Dauvois 2006). According to Caradonna (2012), the French academies adopted their practice of prize-questions from the Floral Games.

The third regional cluster was, again, located in the linguistic zone of the *langue d'oïl*, where it partly overlapped with the *Puy*. While the *Puy* was focused on poetical competition and performance, the *compagnie joyeuse*, as described by literary historian Katell Lavéant (2011), was focused on theatrical and ceremonial performance and competition in the context of public festivities such as during processions and Carnival. Between the mid-fourteenth and seventeenth centuries, these two clusters inhabited and cocreated a northern cultural zone in which the *seconde rhétorique*, appropriated from the southern city of Toulouse, began to flourish, in close conjunction with the Franco-Flemish musical culture of the cities and courts of France and Burgundy in the area. The rhetorical culture of the *compagnie joyeuse* was strongly farcical in nature and exerted considerable influence on Rabelais. This rhetorical culture

has long been misread by Bakhtin and others as a form of authentic folk culture (before the early modern great division between *élite* and popular culture), largely because of its farcical and festive nature (cf. Beam 2007). A study of the social background and intellectual claims of this culture shows, however, that, if the popular-*élite* distinction should be applied at all, given its intellectual (tongue-in-cheek) nature, it should be positioned close to the *élite* side of the equation. Both the *Puy* and the *compagnie joyeuse* were sophisticated, carefully constructed cultures, with philosophical ambitions (as expressed in their claims to embrace rhetoric), and embedded in, and connected to clerical and textual traditions (in manuscript and later also in print). While Lavéant focused on the *compagnies joyeuses* in the Burgundian-Habsburg realm, the scattered evidence suggests that these theatrical companies may have existed as far south-west as Bordeaux and as far south-east as Lyon and Saint-Jean-de-Maurienne in Savoy (linking the northern world of the *langue d'oïl* with the southern world of the Franco-Provençal) (Chappaz-Wirthner 1995; Tuailon 2008; Krumenacker 2009).

What is interesting about them, and has been so confusing to historians, is that they need to be studied from the perspective of the rise of the vernaculars as intellectual languages, and at the same time cannot be separated from their embedding in the world of practice through their role in festive meetings in more or less restricted public spaces. In the case of the *Puy*, the public competitions were sponsored by confraternities which were founded for that purpose (and, given their level of institutionalization, have left traces other than literary manuscripts in archives, libraries, museums, and public buildings). The *Puy* confraternities also supported more private literary cultures in their corporate meetings and at banquets in honor of the Prince of the *Puy*, for example. That private, more informal side remains more obscure for the *compagnie joyeuse*, due to the lack of sources, which either have not yet been identified and studied or were destroyed in the wars that, from the seventeenth to the twentieth century, ravaged much of this area in Europe.

A fourth cluster emerged in the Flemish-Dutch-speaking areas south of the river Rhine and Meuse in the Low Countries. The southernmost part of this region was integrated into the geographically extensive cultural zone of the *seconde rhétorique*, institutionally shaped by the *compagnies joyeuses* and the confraternities of the *Puy*, with their agonistic public festive and performative practices. The first Flemish-Dutch regional cluster seems to have been modeled on, and integrated in, the world of the *compagnie joyeuse* and its theatrical competitions. Like the *compagnie joyeuse*, this early theatrical world of the Flemish-Dutch-speaking Low Countries has received little attention, partly due to a lack of sources (the result of a lack of institutionalization). The more institutionalized these companies became, the more they left traces in the archival record, for example, through recorded subsidies in city accounts. Anne-Laure Van Bruaene (2008) was the first to uncover the existence of a more institutionalized group of companies, termed the *titels*, largely active in the south west of the County of Flanders. It had long been known that from the late fourteenth century onward so-called *esbattement* players were active in the region. These groups become visible to historians in the record since they often visited processions or other festivals in neighboring towns. Possibly created for the occasion, they would engage in theatrical performances of a comical or playful nature, in the vein of the *compagnie joyeuse*. Such groups would also take part in competitions in the French-speaking south, or they would hold competitions of their own in the context of the many shooting contests organized by the militia guilds of the area, which were also attended by French-speaking groups. They may often have been institutionally related to these guilds. The notion of *esbattement* reveals the rising influence of French as a reference culture in the Flemish-Dutch-speaking area in the fourteenth and fifteenth centuries.

A few other sources register the shaping of a different, more poetical, type of literary culture which may have been equivalent to the Parisian *court amoureuse*. This type of literary culture was related to a more private world, which could be connected to religious confraternities, as in Bruges, to an aristocratic household, or to a militia

guild. The existence of this literary culture remains difficult to trace since its private nature did not call for public record-keeping. Here the performance of literary texts, largely poems or songs, would take place at festive banquets, sometimes in an agonistic, sometimes in a conversational spirit. The little evidence that exists (a cluster of related literary manuscripts) indicates a strong link to the upper echelons of society, with aristocrats and clergy playing leading roles. The evidence also suggests a powerful connection to the flourishing musical culture of the area and to the regional courts of Bruges, Brussels, and (until the 1420s) The Hague. This culture of literary banqueting might have become relatively institutionalized as well, with the term *gezelschap van genuchte*, or joyful company, as a Flemish-Dutch equivalent of the *compagnie joyeuse*.

The evidence, limited as it is, allows us to speculate that these private meetings were related to the theatrical culture of local public festivals. What is much less clear is whether these groups might have provided the structure for the less regular *esbattement* players or the West-Flemish *titels*. Whatever the case, these public and private associations were part of a cultural zone connecting the French-speaking north to the Flemish-Dutch-speaking south, resulting in an intensification of cultural exchange. It is no accident that this cultural zone was also being integrated politically. This happened first in the two dynastic complexes of Hainault-Holland and Burgundy-Flanders, which then continued in the Burgundian composite state, comprising most of the area: from Burgundy itself in the deep south, to Hainault, Artois, Flanders, Brabant, Holland, and Zealand in the north. The competition between the two Valois states, France and Burgundy, added extra pressure to the development of a highly integrated cultural zone stretching from Caen in Bretagne in the southwest to Alkmaar in Holland in the north-west, and from Lyon in the south-east to Bois-le-Duc in the north-east of Brabant. One of the most evident signs of the intensified integration of this zone is the rise of a fifth highly institutionalized regional cluster, blending elements from the earlier theatrical groups and banquet meetings with agonistic and ceremonial

practices of the *compagnie joyeuse* and the *Puy*. Even more significantly, the new Flemish-Dutch institutions appropriated many of the literary genres, practices, and discourses of the *seconde rhétorique*; in doing so, they also created a new, hybrid, highly rhetorical literary language, full of French and Latin loan words. As if to claim the Romance literary legacies, these new Flemish-Dutch institutions were not only called chambers or companies of rhetoric, but they also identified themselves with the older *gezelschap van genuchte*, or joyful company (Van Bruaene 2006, 2008; Van Dixhoorn 2009). As a result of this development, by 1500, the French literary culture of the north had become a reference culture of its own, competing with Latin (and Italian), from Toulouse to Leiden, in a world of regional institutional clusters struggling to revive ancient rhetorical practices. In turn, Flemish-Dutch rhetorical culture became a culture of reference in the Burgundian world.

With French becoming the language of the kingdom of France in the sixteenth century, the Toulouse *Consistori* was renamed a *Collège de l'Art et Science de Rhétorique* in 1513, with reference to the French rhetorical culture of the north. From the mid-fifteenth century, most of the Flemish-Dutch chambers of rhetoric adopted a flower as a symbol or name for their company, a nomenclature which may have been inspired by the Toulouse Floral Games. The evidence is mounting that cultural zones and regional clusters interacted over large distances, influenced one another, and at the same time developed distinct regional features. The regional model of simultaneous convergence (inspiration) and divergence (identity-formation) was repeated on the local and subregional levels. These processes were much less organic than has often been believed, and institution building was a highly conscious form of "invention of tradition," with a deliberate and sophisticated reconfiguration of details taken from elsewhere and blended with local "material" to create a uniquely positioned institution, representative at the same time of both the literary model and of local and regional traditions.

The sixth regional cluster, the Spanish *Justa*, may well have been inspired by the Floral Games.

Yet, if so, it was clearly differentiated into a uniquely regional institution. Its historians, often locally oriented or from the (national) philological tradition, have largely ignored the similarities or have failed to recognize them, so that they are often not even seen as regional but rather merely as local phenomena. The regional clusters discussed here together, as expressions of one complex phenomenon, have until very recently been seen as too local to be compared and related effectively. This is not made easier by a lack of precise knowledge about the origins and developments of these institutions and their networks.

The apparently small amount of evidence documenting the rise of the first cluster of institutions of performative literature in present-day Spain points to a continuity with the Occitan tradition in the Kingdom of Aragon (Álvarez et al. 2008). The city of Valencia seems to have been a real center, with at least four literary contests attested – c. 1330, c. 1390, 1440, and 1456 – with contributions in a hybrid of Occitan and Catalan. Then, between 1474 and 1532, 15 poetry contests were held in the city, most (but not all) of them in honor of the Virgin Mary. Remarkably, given the highly oral and performative nature of these contests, 6 out of 15 are known through printed volumes, beginning in 1474 with the first literary work to be printed in Catalan. The Valencian culture of contests seems to have been interrupted after 1532. Apparently, the poetic contests celebrated from the end of the century onward (1591) were held in Castilian and were similar to those of other Spanish cities. While the available literature on the *Justa* is not entirely clear as to the origin of this typically Spanish (Castilian) institution, its features are at least partly modeled on the poetry contests of Valencia, in which poets from Castilian, Catalanian, and Balearic towns also took part. At the very moment that the Valencian tradition came to an end in 1531, the first *Justas* were celebrated in Seville. A regional cluster of *Justas* took off from the end of the sixteenth century and the early seventeenth century, with contests held from Madrid, Salamanca, Valladolid, Cordoba, Zaragoza, and Seville, to Toledo and Granada in 1614 and 1615. The proceedings of at least five of these

local contests were printed, attesting (again) to the close relationship between the Spanish contests and literary culture at large through the medium of print. While the spatial and temporal extension of the *Justa* is difficult to establish, it is clear that it became a pan-Spanish phenomenon that lasted at least until the end of the seventeenth century. By then, however, the *Justa* as an autochthonous institution was in competition and had become entangled with a Castilian-style academic culture which originated in the *Nocturnos* of Valencia in the 1590s through the influence of the *Accademia degli Intronati* of Siena. On the other hand, the Aragonese tradition of poetic contests allegedly had some influence on poetic competitions in southern Italy, before the rise of the paradigmatic *accademia* (in practice and as a term) in the early sixteenth century (Álvarez et al. 2008; Bouza 2004; Bernal and Jaime 2006).

Like the pre-1532 Valencian tradition, the *Justa* of early modern Spain had a regional impact and influence not only because of the spread of the institution itself, but also and especially because these contests invited and attracted a wider (inter) regional group of contestants. Unlike the Italian-style academies, these *Justas*, strongly linked to festive events, were open and highly public in nature (often celebrated at the end of a communal festive event in churches or monasteries, and organized by institutions related to these places such as religious orders, brotherhoods, or guilds). The Spanish-style academies, on the other hand, were (relatively informal) associations, organizing internal contests in a farcical tradition, largely open to members or at least regular participants only. They also relied much more on textual improvisation than the more doctrinal contributions to the (religiously themed) *Justas*.

During the same period in which the Valencian Catalan and the first Sevillian poetry contests were held (1474–1532), several cities in the High German cultural zone of today's Germany, France, Austria, and Poland also established a seventh cluster of highly typical literary associations. Again, an exact dating of the origins, rise, and development of the cluster is problematic due to a lack of studies focused on these institutions and their relations. For a long time, the dating of

this type of literary institution has been hampered by its inclusion in the field of philology with its highly technical text-focused disciplinary traditions. Up until the present, and despite the influence of the historicizing and contextualizing trends in literary history which have led to a greater interest in those genres and forms of literary culture that were marginalized in the nineteenth-century canon, these guilds or schools of *Meistersinger* (*Meistersingerzünfte*, *Singschulen*) have largely remained only a secondary topic of research in German philology or a primary topic of interest in studies of local urban culture. These two fields have only intersected in the study of the literary culture of the Bavarian city of Nuremberg and largely out of an interest in the famous *Meistersinger*, polygraph, and artisan, Hans Sachs. The dating problem relates to a misreading of the invention of the *Meistersinger* tradition. Instead of making inter-regional, synchronic, comparisons, German philologists have emphasized a diachronic comparison within the High German cultural zone that has caused much confusion. They have thus largely taken seriously the *Meistersinger* genealogy which formally traces the origins of the *Singschule* to a line of 12 original *Meistersinger*, beginning with the Bavarian aristocrat Wolfgang of Eschenbach (c. 1160/80–1220) (Nagel 1971; Merzbacher 1987; Kästner 1998; Brunner and Wachinger 1986–2007; Egidi et al. 2004; Baldzuhn 2008).

This claim of origin, a (highly successful) invention of tradition, is similar to the appropriation of troubadour culture by the Toulouse *Consistori*, which claimed to have been established by 12 original troubadours. The established line of tradition between the urban institution of the *Singschule* and the early *Meistersinger*, whose work survives in dozens of often high-quality manuscripts must be broken (Baldzuhn 2008). The difference between the courtly practices and legacies of professional writers of the (minstrel) lyric and epic poetry of the *Minnesinger* of the Middle High German *Sangspruch* tradition and the later, early modern, urban tradition of amateur *Meistersinger*, often from artisanal backgrounds, is *fundamental*. The genealogy, strongly ingrained in the practice of

the later tradition, is only practical in an inspirational sense: The claim rests on a clear appropriation of aspects of the older tradition in a new world (Baldzuhn 2008).

Four important aspects of the appropriation should be emphasized as key elements in the self-stylization of the new *Meistersinger*: the musical tradition in the reuse of “original” (i.e., traditional) tunes; the importance of inventing new tunes in order to achieve true *Meistersinger* status; the references to the learned status of the “original” *Meistersinger*; and the claim to an autochthonous, unbroken tradition of learning in the High German language and to an unbroken continuity with antiquity. Yet, these influences are only indirect, not direct, and the result of an original creation that blended interpretations of previous traditions with contemporary appropriations and inspirations that remain to be studied. The differences between the courtly-aristocratic *Sangspruch* tradition and the urban *Meistersinger* tradition are manifold. An interesting difference is that the older tradition would establish a link to antiquity through the reference and use of ancient epic traditions, the new *Meistersinger* lyric would reference and use the Hebrew Scriptures, the Psalms, in particular. More significant still, the *Meistersinger* were organized in urban associations that held regular private and public contests for members and would-be-members only. In what might be a nod to the older tradition, *Meistersinger* would only publish individual works in print, never proceedings of contests. The texts related most closely to their oral and performative practice survive in manuscripts, often miscellanea of the most famous *Meistersinger* from various towns.

Only if the historical distinction between *Meistersinger* culture and the earlier *Sangspruch* is made, can a clear chronology of the *Meistersinger* movement, in comparison with other regional clusters of literary associations, be established. Only then can the discussion of mutual exchanges and influences can begin. The evidence, then, points to the making of the new tradition in the imperial city of Nuremberg in the 1470s, with the mythical number of 12 founders. The Nuremberg college of *Meistersinger* seems to have been

incorporated before 1496. It is not entirely clear whether Nuremberg also invented the *Singschule* as a permanent institution, given that, in the imperial city of Strasbourg in 1492, 16 *Liebhaber der Kunst* joined to form a *Singschule* as a formal association. It seems therefore safe to conclude that the institution of the *Singschule* was created at the end of the fifteenth century in competition between two imperial cities that were soon joined by the city of Freiburg in Breisgau in 1513 and Ulm in 1517. If this genealogy is correct, we must also conclude that in the century between 1470 and 1570 from Castilian-speaking Spain and the French-speaking Toulouse in the south, to French-Picardian and Flemish-Dutch-speaking areas up north, or from the French-speaking city of Rouen westward to the High-German-speaking city of Nuremberg eastward, several distinct clusters of regional literary traditions, institutions, and associations emerged, sometimes, but not always, grounded in early developments and institutions dating back to the thirteenth century. In exactly the same time span, the first Italian academies of Rome and Siena emerged (1520s and 1530s) (Samuels 1976; Bryce 1995; Chambers and Quiviger 1995; De Beer 2008; Werner 2008; Testa 2015; Everson et al. 2016). Their cultural design was clearly marked by very similar oral and performative practices in ways that are reminiscent of the *compagnies joyeuses* and the law clerks of the *Basoche* of France (Bouhaïk-Gironès 2007, 2008) or the lawyers of the Inns of Court of London (O'Callaghan 2007; Sobocki 2015; Winston 2016).

Beyond the many features that make these traditions look so different and distinct, their institutions and associations share at least one defining characteristic. They all sponsor regional traditions of performative literature in oral, often highly ceremonial and/or festive, settings. They are all located on a continuum from private to public and from informal to formal. The geographical span of these types of clusters and the depth of their regional integration (for the Hanseatic cities of the north, see, the *Zirkelbruderschaft* in Lübeck) remains an open question that can only be answered imprecisely. Yet the intensification between 1470 and 1530, for example, in the entire

cultural zone of South-Western Europe, which roughly equates to the urbanized zone, but also the early zones of print culture, is evident. The periodization of these institutions is at odds with the medieval-Renaissance divide, stretching from 1200 to 1900 (from the earliest to last surviving examples), or from the end of the fifteenth to the end of the seventeenth century (from the period of greatest flourishing, rise and spread of the regional clusters to cultural prominence, and early demise as cultural references in the vernacular world). Italian academies were not the first to institutionalize an oral, performative, and agonistic literary culture in the vernacular; they were the last cluster to emerge. By 1500, the urban networks of Western Europe were brimming with forms of public and private, formal and informal literary sociability dating back to the 1200s.

Innovative and Original Aspects

While the institutional clusters of literary sociability in premodern Europe can be easily identified on the basis of the central role of performative practices, their internal organization and external positioning exhibited tremendous variety. The first category of organizational principles to be discussed relate to the position of these clusters on the continuum from informal to formal. At the very beginning of every initiative and project must have been an informal gathering of enthusiasts, inspired by an idea and in search of a model. The models for a more formal organization of sociability in Europe, ensuring a form of continuity, social status, and regulation of behavior within a mixed company, were, on the one hand, the corporation and, on the other, courtly and communal feasts. At the basis of recreational sociability in both cases were the banquet, the procession, ceremonial events, and Carnival. In aristocratic, clerical, and scholarly circles, festive events would be accompanied by music, dancing, spectacle, and the performance of epic, lyrical, or farcical poetry (by a professional minstrel or by the youngsters: students and apprentices). An informal group that sought to consolidate a form of literary sociability would take up a few of these

means and blend them into a set of practices carried out regularly. They could take their example from anywhere to which they had access, and once they became successfully established, they could in turn become the inspirational model for another group, elsewhere, to create a similar form of sociability (van Dixhoorn and Sutch 2008).

They then faced at least two choices: either to copy the model and appropriate it to local circumstances or to use it as an inspiration for the creation of a new blend by adding and subtracting elements and integrating them into local practices. When the initiators decided to copy an existing model, the transfer of practices and ideas resulted in the shaping of a network, a regional cluster. When, on the other hand, the elements of the cluster were appropriated from a preexisting regional performative culture, the regional cluster and the cultural zone together began to produce cultural specificities. In some cases, two or more regional clusters inhabited and together created one cultural zone, as happened in France, the French-speaking Low Countries, and Spain. The Dutch-speaking chambers of rhetoric inhabited a highly homogenous cultural zone, but they were so closely entangled with the French-speaking world that it could be argued, at least in the southern Low Countries, that they inhabited the same, bilingual (or trilingual, if we also count Latin) zone, a region dense with cultural transfers between communities. Like the Flemish-Dutch chambers of rhetoric, the regional cluster of the *Singschule* inhabited a zone of its own, whose particular blend of performative culture remained largely unchallenged by alternatives.

The literary practices of the clusters that represent the institutional zenith of premodern literary sociability can be distinguished from the recreational settings in which performative literature was an important focus, but not the main emphasis. In the gatherings and meetings of these institutions, which took place at regular intervals, literary performance was the defining element, and banqueting and drinking were reduced to secondary importance. The two basic organizational principles of the corporation and the (communal) feast were blended in a remarkable

variety of ways to sustain forms of literary sociability. Some of the clusters were modeled more on the corporation, others more on the feast, and some blended elements of the two models. The *Puy*, the *Consistori*, and the *Justa* provide examples of one type of blend: They were based on the model of an open literary contest organized by a corporation. In the case of the *Puy* and the *Consistori*, the corporation was created for the purpose of sponsoring such an event regularly. The confraternities of the *Puy* organized *Puys*, poetic contests, often in a secluded space such as a church or a chapel, open to anyone who wished to attend. The *Consistori*, too, organized regular contests, the famous Floral Games, which anyone could attend. Members of the *Consistori* were then recruited from among the winners of the contest, whose career expressed in titles resembled that of a university student (from bachelor to doctor). This seems not to have been the case in the *Puy*, and the *Justa* model also did not have a specific confraternity to sponsor the event. The contests of the *Puy*, *Justa*, and *Consistori* drew from a local as well as a regional field of contestants.

The *compagnie joyeuse*, on the other hand, followed an entirely different model, that of the feast. These companies most likely resembled an informal group of people (with some level of organization, administration, and leadership) rather than a formal corporation (with all the rules and regulations, privileges, property, and social status that such a group might accrue). Instead, while they may have been supported by the local government or a local guild, or a network of local leaders, the *compagnie joyeuse*, it seems, was organized loosely around one or a few leading figures. Whereas the *Consistori*, the *Justas*, and the *Puy* focused on lyrical performances, the *compagnies joyeuses* were strongly connected to public ceremonies and processions. Their performances followed a more festive, more theatrical, and more farcical logic. Unlike the contests of *Consistori*, *Puy*, and *Justa*, whose invited participants were individuals, in the areas that formed the French-Flemish cultural zone, the companies organized festive contests to which they would

invite other *compagnies joyeuses*. The main genre in which these companies competed seems to have been theatrical: The answers presented at these rhetorical contests to the prize question would take the form of plays. The model of contests open only to members of a collective may have inspired the chambers of rhetoric in their particular regional blend.

Unlike the *compagnie joyeuse*, the chambers of rhetoric (or most of them), heavily inspired by the models provided by the rhetorical culture of the French-speaking zone, were closer to the corporate model, but they also extensively borrowed from the model of the feast. They organized a culture of literary sociability that took elements from the *Puy* and from the *compagnie joyeuses* and blended them with others taken from an urban aristocratic banqueting culture that had been developing in the cities of Flanders and Brabant, and may also have been partly inspired by the *court amoureuse* of Paris, a form of literary sociability that was fashionable around 1400. The chamber of rhetoric was organized according to the corporate model, with a formal board and regulations, and the ability to acquire rights and properties, very much like the *Consistori* or a confraternity of the *Puy*. Yet, in contrast to these institutions that sponsored the literary activity of others, members of the chambers formed the pool of participants in the literary practices they organized, very much like the *compagnies joyeuses*. Yet, differing from these models, the focus of the chamber of rhetoric was on private gatherings and contests, open only to its members. At the same time, at regular intervals, the chambers took part in public festivals and organized contests to which they invited other chambers, not individuals. These contests often combined theatrical and lyrical genres and, more like those of the *compagnies joyeuses* than of the *Puy*, were accompanied by extensive use of spectacle and of ceremonial practices. The *Puy* of Amiens, in particular, may have inspired the chambers of rhetoric to create a highly visual culture (Scaillièrez 2017). In the *Puy* of Amiens, the Prince of the Puy would donate to the cathedral a painting illustrating the annual theme of the contest. The chambers of

rhetoric focused their visual culture on the *tableau vivant* and the *blazon*, that is, a panel painting representing a flower, motto, patron saint, and the name of the chamber or, in a contest, visualizing a theme in return for a prize (Ramakers 1996; Vandommele 2011).

The private gatherings and contests for members only, on the one hand, and the highly institutionalized regional contests for chambers only, on the other, were the hallmarks of the chambers of rhetoric. Elements of all the different clusters discussed here appear in a unique way again in the *Singschule*, which most closely resembles the model of the chamber of rhetoric. The *Singschule*, too, was a company of participants, the *Meistersinger*, organized in the form of a brotherhood. The members, apprentice singers, and master singers were the only ones allowed to take part in private literary performances and contests. Unlike the chambers of rhetoric, the *Singschule* network remained informal and did not organize regional contests. The *Singschule* also engaged in theatrical culture, which from the seventeenth century became the norm; however, the basic features of the *Meistersinger* tradition were focused on the recital of lyrical poetry, texts versified and performed by a *Meistersinger* and set to his own tune or to a standard one, with the Psalm as the ancient genre of reference. Whereas the chambers of rhetoric did not provide a clear career path for members, the *Singschule* began with an apprenticeship, including participation in contests, which was concluded by formal acceptance into the company of *Meister*, who explicitly claimed to be continuing the tradition of the original *Meistersinger*, similar to the way in which the early *Consistori* claimed to perpetuate the tradition of the Occitan troubadours.

Impact and Legacy

The rise of these regional clusters simultaneously helped to fix, shape, and produce regional literary traditions. The way in which these clusters engaged with literary culture was highly self-conscious, with traditions being revived,

reinvented, and drafted into specific forms. A deliberate positioning is apparent from the simultaneous building on and appropriation of older forms (sometimes extinguished in practice) or forms from other cultural or linguistic zones, crafting new and regionally or locally specific practices, while also referring to universal or ancient examples. This is not only visible in the deeper structural relations of these institutions with their environments (local culture, cultural zone, regional cluster) and the types of their activities, but also, with reference to Lévi-Strauss (1962), the groups involved in tinkering with available material to shape the structures of performative literary culture into local and regional molds were *bricolaging*. This was, after all, a world of (oral) practice.

This is also visible in elements that became typical of mainstream Western European literary sociability: the mimicking of existing structures, institutions, and authorities in the use of titles. For example, the ceremonial leader of the confraternity of the *Puy* was called the prince, and the *compagnies joyeuses* (which used military, aristocratic, and clerical titles for their leading members) also had their “Prince des Sots” (see also the Inns of Court of London: O’Callaghan 2007; Winston 2016). With the introduction of an entire set of ideas and practices from the French culture of rhetoric of the mid-fifteenth century, the title of prince also became standard for the ceremonial leader of the Flemish-Dutch chambers of rhetoric. Some of them would also have “kings” or “emperors” (Holland), while other titles adopted by Flemish-Dutch rhetoricians referred to those used in local guilds and confraternities. The *Consistori* used bachelor and doctor for its types of members. The “mantenedor” (jury member) in the *Justa* contests might be a reference to the *Consistori* (Kendrick 2008; Álvarez et al. 2008). The “Meister” in the German *Singschule* has always been interpreted as a reference to the guild system, partly because of their guild-like apprentice system. It should be noted, however, that the “mythical” genealogy of the *Meistersinger* did not refer to artisans but rather to men of great learning and secret cunning, at least one of whom was claimed to have been an alumnus

(a master) of the University of Paris. The use of such references from the “world outside” suggests a strong link between the majority of these traditions and the “world turned upside down” of (clerical, then urban) festive culture. In other words, literary sociability at its heart, even at its most ceremonial and religious (that is, in the *Puy*, *Consistori*, *Justa*, and the *Singschule*), almost always retained or even cherished a playful, often carnivalesque, core. The carnivalesque was most visible in the *compagnies joyeuses* and, to a lesser extent, in the chambers of rhetoric. It also determined the character of the very first Italian academies and most of their offspring (whose ceremonial leader was called “Principe”) in the Italian peninsula and in Sicily; it was strongly present as well in the Spanish academies that spread quickly, alongside and sometimes entangled with the *Justa*, from late sixteenth-century Valencia onward (Robbins 1997; Álvarez et al. 2008).

The use of titles and deeper structural principles in *bricolaging* a new regional type or a local version was paralleled in the way in which literary genres were appropriated to form regional traditions. Most of these genres became typical of their clusters and were strongly linked to the performative practices of meetings, contests, and festive events. The provenance of similar texts in manuscript or print (or inscribed on panels or stones) that have no apparent link to any of the institutions of a cluster or of its members or participants can still be seen as indicating a likely connection to the activities of an institution in the cluster. In any case, of course, genres related to institutions of performative literary culture were entangled with private *convivia* or public festivals and with the private or public competitions. Since they had to respond to a set prize question, texts written for such occasions were more ephemeral than other types of text. Nevertheless, many of them have survived in manuscript collections and in print because of the prestige that this culture attached to these events and genres.

The *chant royal*, for example, became typical of the *Puy*, while the *ballade* and various sorts of mock-genres became typical of the *compagnie joyeuse*. The Flemish-Dutch tradition was

strongly inspired by the French rhetorical zone, taking elements such as complicated rhyme structures, elevated and abundant language, or the use of a stanza dedicated to the Prince or of the “refrain,” the typical *sententia* of each stanza of the ballade and chant royal. The *refrain* gave its name to the entire Flemish-Dutch genre of the *refrein*, with its *stock-regel* (the French *refrain*). The Flemish-Dutch *refrein* became the core genre of rhetorical sociability. From exchanges with the French traditions, Flemish-Dutch rhetorical culture also developed theatrical genres (the comical *esbattement* and *cluchte*) and also more distinctive genres such as the banquet play (*tafelspel*), often a witty dialogue between a few personified concepts, intended for performance at banquets, and a rhetoricized *moralité*, the *zinnespel* (or *spel van zinne*). The *zinnespel* (combining serious allegorical dialogue with farcical, musical, and visual elements discussing a *questio*) was the most prestigious of Flemish-Dutch rhetorician genres; it became the core genre of the public performances and the rhetorician contests (Spies 1990; Ramakers 1996; Moser 2001; Keßler 2013; Mareel 2013). Like the French *chant royal*, *farce*, *sottie*, and *moralité*, the Dutch *refrein*, *lied* (song), *clucht* and *zinnespel*, *Consistori*, *Justa*, and *Singschule* had agonistic genres. Along similar lines, the Italian academies would develop the sonnet, and the Spanish academies the farcical *vejamen*, a lyrical genre focused on the mockery of a person’s facial features. The sonnet and *vejamen* were also connected with *convivia* and agonistic practices. These regional traditions did not become immutable and impermeable once they had been established as the regional culture of reference. Ongoing interactions and transformations continued well into the seventeenth century, when the number of clusters and new types of literary and learned institutions in the (vernacular and Latin) world of practice was growing rapidly, not only in France, Spain, and Italy, but also in Germany, the Low Countries, and Britain; a more modern “academic” movement was born that in time marginalized the older culture (van Dixhoorn and Sutch 2008; for competition and genre development Armstrong 2012).

With their focus on vernaculars, their strong link to the corporate and festive type of sociability, and their preference for orality, performance, live interaction, and exercise, these institutions clearly mediated between the literary world and the world of practice. Yet, this does not reveal much about the pool of participants from which they recruited members or about their organizational and intellectual leadership. After all, to a certain extent at least, universities were also mediators between the world of literature and the world of practice. Universities, however, were centers of scholarly learning that had strong administrative structures and that left behind an abundance of sources, whereas most of these institutions were much more informal and much less strongly integrated with the realms of power. Since they were run with limited resources by lay amateurs, these civic institutions of literary culture have also left behind fewer enrollments or financial registers. As a result, it is at times difficult or impossible to know how exactly they were run on a daily basis, or who their members or participants were from year to year. Frequently only the names of some of the more prominent members or participants survive.

A few preliminary conclusions about memberships can be drawn. The first is that both in Flemish-Dutch rhetorical and in German musical (*Singschule*) culture artisans played a prominent, if not leading, role. It is enough to mention Hans Sachs, a shoemaker from Nuremberg who was one of the most famous, even paradigmatic, of the *Meistersinger*, a culture that seems to have been grounded predominantly in artisanal circles. The Flemish-Dutch rhetoricians also recruited strongly from among artisans, especially painters, printers, and others working in the luxury arts; they also attracted traders, teachers, priests, and members of the local patriciate and lower nobility. The most famous rhetorician, Anthonis de Roovere of Bruges, was a mason. Prominent scholarly figures such as Hans Sachs were exceptional among the German *Meistersinger*, as well as among the rhetoricians, who were strongly integrated with local vernacular (and humanist) cultures of learning, through the many less eminent scholars such as De Roovere that they

increasingly produced; but we know much more about the membership of the chambers of rhetoric than about the *Singschule*. The French *Puy* seems to have attracted a similarly broad field of participants, also recruiting mainly from among artisans, as well as clergymen, but with strong support from local officials and patricians (often through membership of the confraternity that patronized the *Puy*). Given their far more informal structures and, consequently, lack of institutional archives, the membership of *compagnies joyeuses* is even more difficult to track down. The limited evidence about participants and leadership indicates at least the participation of patrician and clerical circles; on the other hand, that the printers of Lyon established their own *compagnie* suggests an artisanal presence, too. The proximity of the Toulouse *Consistori* to the university and the *Parlement* suggests a strong university-trained presence, possibly lawyers, in particular, making the *Consistori* similar in its recruitment to the *Basoches* (Bouhaïk-Gironès 2007, 2008). This professional corporation of law clerks attached to the French *Parlement* was so powerfully engaged in French rhetorical culture that it can be considered another institutional cluster of performative literature. The *Justa* of Spain, linked to religious institutions (monasteries and brotherhoods), seems to have recruited among clergymen and scholars, but the wider field of contestants remains difficult to assess. The Spanish academies appear to have recruited in circles of aristocrats, patricians, and professional *literati*. This is reminiscent of the Italian academies that, however, socially seem to have cast their net much more widely.

Finally, unlike the more informal *convivia* that permeated the social fabric of early modern cities and courts, the more institutionalized structures were dominated by men. They provided the leadership, the penmanship, and the actors and participants in contests. Women were an exceptional presence. One such was the Antwerp teacher Anna Bijns, daughter of a well-to-do artisan; between 1528 and 1567 she had three volumes of rhetorical poetry (mostly in the *refrein* genre) published with the support of the local Franciscans, and the evidence of her printed work and the

surviving manuscripts indicates that she was also active in circles of rhetoricians (Keßler 2013). Ironically, she became the most famous rhetorician of all. Although she was not the only one taking part in rhetorician culture, most women who can be connected to it were members of the supporting corporations that organized the devotional culture of the company of rhetoricians in a church or chapel. Most chambers explicitly excluded women from the rhetorical exercises and only allowed them to be present in non-rhetorical settings. This exclusion of women seems to have been a standard feature of these institutions, making the culture strongly masculine. There was a world of young men, directed by a small number of long-standing older members. This dominance of young men may also have been the case in the *compagnie joyeuse*, the *Singschule*, the *Puy*, the *Consistori*, the *Justa*, and the academies of Spain and Italy. The strong presence of young men underscores the pedagogical role in the training of their members in rhetorical skills, often before they embarked upon their literary, learned, or civic careers.

Livy in the Renaissance

John-Mark Philo

University of East Anglia, Norwich, UK

Abstract

The Renaissance saw the study of Livy flourish. Whether harnessed as a stylistic model worthy of emulation or as a textbook of statecraft and governance, Livy's *History of Rome* found perennial favor among his Renaissance readers, contributing significantly to the development of humanist and political thought.

Impact and Legacy

Livy's (64 BC–12 AD) history of Rome, the *Ab Urbe Condita*, thrived during the Renaissance. From debates over the rights of women to questions concerning the ideal republic, his *History* played a central role in the period's political, cultural, and literary achievements.

Livy was born in Patavium, modern Padua, and began writing his vast *History of Rome* between 27 and 25 BC. Of an original 142 books, only 34 now survive (books 1–10 and 21–45) along with a few other fragments. Interest in Livy was piqued during the Renaissance by the tantalizing prospect of discovering the lost books. This anticipation was rewarded by two major discoveries in 1518 and 1527, which saw the recovery of just over five books of the *History* from monastic libraries in Germany.

Livy was received with enthusiasm in the Italian Renaissance. For Dante (1265–1321) he was “Livio [...] che non erra” (“Livy who does not err”), while Petrarch (1304–74), whose annotated copy of Livy is now preserved at the British Library, played a key role in his textual transmission. Boccaccio (1313–75) relied on Livy for the *De Mulieribus Claris*, his collection of famous women, and is commonly identified as the author of a fourteenth-century translation of the *History*. It was from an Italian press that Livy first appeared in print, published in Rome by Konrad Sweinheim and Arnold Pannartz in 1469. Following the publication of the editio princeps, Livy swiftly became a popular choice among European printers for well over a century, appearing in the major publishing houses of Rome, Florence, Venice, Cologne, Paris, and Basle. Livy was subsequently translated multiple times into the vernacular languages of Europe. Between 1469 and 1600, more than a hundred such translations were printed across the continent.

Throughout the Renaissance, Livy was seen as a treasure trove of political examples which could be readily applied to contemporary statecraft. It was to this end that Machiavelli (1469–1527) composed the *Discorsi* (printed 1531), a series of topics inspired by his reading of the first decade which combed the history for examples of governance to be replicated or avoided. This politicized reading of Livy is also demonstrated by the annotations left by the English scholar Gabriel Harvey (1552/3–1631) on his copy of the *Ab Urbe Condita* (preserved at Princeton University Library), which homes in on examples of diplomatic excellence and political shrewdness. Livy's account of Rome's transition from a monarchy to a republic, as recounted in the first and second books, proved to be of special interest in this regard and was frequently cited in works critiquing absolute monarchy.

One of the strongest patterns surrounding Livy's Renaissance reception concerns his depiction of extraordinary women. Repeatedly his accounts of remarkable women (Lucretia, Verginia, the Sabine Women) were tied to literary and philosophical debates concerning women's

worth. This tradition was particularly strong in Italy, where Livy was yoked to debates over sumptuary legislation by (among others) Nicolosa Sanuti (*fl.* 1453) and the celebrated educator Guarino Veronese (1374–1460). This way of reading Livy's history spread from Italy and was taken up by authors in western and northern Europe for the *querelle des femmes*, the literary debate over the status and nature of womankind.

The most popular sections of the *Ab Urbe Condita* for Livy's Renaissance readers were undoubtedly Livy's descriptions of Rome's legendary past (Book 1–5) and the war with Hannibal (Books 21–30). Authors of prose fiction and drama harnessed the narrative potential of these sections, not least of all William Shakespeare (1564–1616), who drew on the first pentad for *The Rape of Lucrece* (1594), *Macbeth* (1606), and *Coriolanus* (c.1608). Livy also proved popular as a stylistic model, especially in respect to the speeches he puts into the mouths of Rome's most celebrated generals and politicians. From as early as 1509, the orations were being cropped from Livy's *History* and reproduced in smaller volumes, frequently marketed as rhetorical exemplars.

Lomazzo, Gian Paolo

Born: 26 April 1538, Milan

Died: 1592, Milan

Barbara Tramelli

Università Ca' Foscari Venezia, Venice, Italy

Abstract

The painter and writer Giovanni Paolo Lomazzo wrote two of the most complex treatises on art in sixteenth-century Italy: The

Trattato dell'Arte della Pittura (1584) and the *Idea del Tempio della Pittura* (1590), both published in Milan by Paolo Gottardo Pontio. Defined by Schlosser as “the bible of Mannerism,” the *Trattato* is divided into seven books dedicated to the seven parts of painting, namely proportion, movement, light, color, perspective, *storie* of painting, and the practice of painting. It is one of the most complete attempts to give painting a defined theoretical structure.

Biography

The best biographer of Giovanni Paolo Lomazzo is undoubtedly himself. As we read in the autobiography written at the end of the *Rime* (1587), the artist describes his birth and early years thus:

In the year of our Lord, 1538, on the 26th of April, on a day sacred to Cytherea, I was born in Milan, at five o'clock. Growing up I always had my mind focused on drawing, so I was sent to a master when I was ten years old, who taught me to write and to count, to handle books, and then to draw. With these beginnings I started to paint under a follower of Gaudenzio Ferrari, a respectable painter named Giovanni Battista della Cerva. He encouraged me, seeing that I was prepared for success in this art. So at that time I executed various works: paintings, caprices, *storie*, friezes, grotesques and various decorations with cartouches, trophies, landscapes and fruits, which I painted in the three styles. (Lomazzo 1587)

He was the son of Giovanni Antonio Lomazzo and Lucia Mozzanica, and he lived in Milan in the parish of Santa Maria Beltrade. Painter, writer, and academician, Lomazzo is one of the prominent figures of the artistic scene in Milan in the second half of the sixteenth century. He was part of the cultural life of the city, and he was elected chief of the *Accademia de la Val di Blenio* in 1568, an informal “burlesque” academy which was distinguished by the heterogeneous character of its

members (artists, men of letters, astrologers, and musicians, among others), as well as by the language spoken there, the so-called “bleniese” dialect. This fictitious language was created by the members, and it was inspired by the figure of the humble porter who brought wine and food to Milan. The main literary achievement that testifies to the activities of this academy is the collection of poems *Rabisch* (“Arabesque”) published in 1589. On his activity as a painter not much remains, as the artist supposedly became blind at the age of thirty-three and had to give up his painting career. Among his pictorial works, worth mentioning are the self-portrait as Abbot of the Val di Blenio (Brera), the Foppa chapel in San Marco, and a copy of the last supper of Leonardo in S. Maria della Pace now lost.

Lomazzo's writings, the *Trattato dell'Arte* (1584) and the *Idea del Tempio della Pittura* (1590), along with the short *libello* dedicated to duke Ferdinando de' Medici entitled *Della Forma delle Muse* (1591), constitute his major achievements regarding his “art theoretical” production. Other writings such as the *Libro de' Sogni* (1563 unpublished), the *Rime* (1587), and the *Rabisch* (1589) do not have painting as their main subject, although they should still be taken into consideration in order to understand the artist's literary background and his views on different topics beyond art (Isella 1993; Bora 1989; Bora et al. 1998).

The *Trattato dell'Arte* and the *Idea del Tempio della Pittura*, which were probably intended to be published together, have been considered one of the most complete attempts to define the structure of a painting, following the Neo-Platonist approach and the new concept of *Idea* (Ackerman 1967). The treatise had three editions in 1584 and one in the following year, in 1585. Though until recently regarded as an editorial failure, there is evidence that artists such as Leone Leoni, Daniele Crespi, Giulio Cesare Procaccini, Pellegrino Tibaldi, and Jacopo Ligozzi owned a copy of the book. In some cases, it was donated by the author himself, who was a good self-promoter. The first five books were translated into early-modern English at the end of the sixteenth century by the scholar from Oxford Richard Haydocke, who

gave it the title *A Tracte Containing the Art of Curiose Painting* (1598).

A critical edition of all Lomazzo's writings was published by Roberto Paolo Ciardi (1973).

Lorki, Joshua

Born: Unknown; born perhaps in Alcañiz, Kingdom of Aragon;

Died: between 1417–1419, place unknown

Benjamin R. Gampel

The Jewish Theological Seminary, New York, NY, USA

Abstract

Aragonese Jewish intellectual and physician born in Alcañiz prior to 1370. HaLorki enters the historical record as the author of a Hebrew letter to Pablo de Santa María, the erstwhile Shlomo haLevi, rabbi of Burgos. Yehoshua also penned an Arabic medical tract entitled in Hebrew, Gerem haMa'alot, on the therapeutic value of foods and medicines.

Around 1411, Yehoshua haLorki converted to Christianity and took the name Jerónimo de Santa Fe. Thereupon, Avignon Pope Benedict XIII, at the end of February 1412, declared Jerónimo to be his personal physician and a member of his court. In August 1412, Jerónimo presented Pope Benedict with a treatise – *Ad convincendum perfidiam Judaeorum*, in which he argued that the messiah had already come, and in the personhood of Jesus. In August of the following year, Jerónimo wrote another polemic against the Jews, *De Iudaicis erroribus ex Talmut* in which he demonstrated, among other things, that the truth of Christianity was attested to in the corpus of rabbinic literature.

The first of these writings functioned as source material for Jerónimo as the chief representative of Christianity in a disputation that Benedict convened in the city of Tortosa with the representative of Jews from the Crown of Aragon. This 62-session debate began in February 1413 and came to an end in April 1414. The second essay was essential for Jerónimo when a second disputation was launched in San Mateo in June 1414, which lasted for 7 sessions. After this debate, Jerónimo participated in conversionary activities and devoted much energy to the separation of Jews from Christians. Documents from 1419 indicate that Hieronymus de Sancta Fide, the former Yehoshua haLorki, was already deceased.

Biography

Aragonese Jewish intellectual and physician born most likely in Alcañiz prior to 1370. His family probably hailed from Lorca in the Kingdom of Castile. His father, Yosef ibn Vives, was a poet, philosopher, and physician, who translated Arabic works into Hebrew.

HaLorki first enters the historical record as the author of a Hebrew letter to Pablo de Santa María, the erstwhile Shlomo haLevi, rabbi of Burgos, who converted to Christianity sometime around 1391—most likely before the anti-Jewish riots that engulfed the Kingdom of Castile and the Crown of Aragon. In this letter, in which HaLorki appears to move in distinguished Jewish intellectual and political circles, Yehoshua refers to the erstwhile Shlomo as his teacher, perhaps metaphorically. In his desire to know the reasons for his teacher's change of faith, he explores haLevi's hedonistic and opportunistic inclinations, his despair at God's rejection of the Jewish people in favor of the Christians, and his possible epiphany regarding Christian truth. Most of the letter is devoted to

standard forms of Jewish polemical arguments against the truth of Christianity.

Yehoshua also, at the request of a member of the Jewish intelligentsia, penned an Arabic medical tract known by its title in its Hebrew translation, *Gerem haMa'alot*, on the therapeutic value of foods — plants, herbs and spices, and medicines.

Most likely, it was this Yehoshua haLorki who, around 1411, converted to Christianity and took the name Hieronymus de Sancta Fide, Jerónimo de Santa Fe. As Jerónimo, the Avignon Pope Benedict XIII, at the end of February 1412, declared him to be his personal physician and a member of the papal court. He also may well have served as a physician — alongside another Jewish convert to Christianity, evaluating the mental health of one of Valencia's representatives at the negotiations in Caspe, also in 1412, that resulted in the compromise that resolved the succession to the throne of the Crown of Aragon.

In August 1412, probably at the behest of Pope Benedict XIII, Jerónimo presented him with a treatise — *Ad convincendum perfidiam Judaeorum*, Refutation of the Jewish Perfidy, written in Latin and Hebrew, in which the erstwhile Yehoshua followed a long-line of Christian anti-Jewish polemics, by arguing that the messiah had already come, and in the personhood of Jesus. Jerónimo intended the treatise to serve as a foundational work for a planned disputation between himself and the Jewish community of his hometown of Alcañiz. In August of the following year, Hieronymus produced another polemic against the Jews, *De Iudaicis erroribus ex Talmut*, in which he demonstrated to his satisfaction that the truth of Christianity was attested to in the corpus of rabbinic literature and that the Talmud was filled with troubling comments about humanity and contrary to reason, errors contrary to a true understanding of God, arguments in opposition to the Old Testament, and hostility toward Christians and the teachings of Christianity.

The first of these writings apparently functioned as source material for Jerónimo as the chief representative of Christianity in a disputation that Benedict convened in the city of Tortosa in Catalonia with the representative of Jews from

the Crown of Aragon, which began in February 1413 and lasted for 62 sessions until it came to an end in April 1414. The second essay was essential for Hieronymus when a second debate was launched in San Mateo in June 1414 and lasted 7 sessions.

After the disputation, Jerónimo participated in conversionary activities and devoted much energy to the separation of Jews from Christians. While accused of financial extortion by Jewish communities, King Fernando I in 1416 thanked Hieronymus for his conversionary efforts and ordered Jews in a variety of localities to attend his sermons. Jerónimo's success and that of his entourage, in encouraging Jews to leave Judaism and embrace Christianity, and their dedication to royal and pontifical policies that were similarly directed, were rewarded with financial emoluments. Documents from 1419 indicate that Hieronymus de Sancta Fide, the former Yehoshua haLorki, was already deceased.

Love in Renaissance Philosophy

Sabrina Ebbersmeyer

Section of Philosophy, Department of Media, Cognition and Communication, University of Copenhagen, Copenhagen, Denmark

Abstract

The philosophical discussion of love during the Renaissance was strongly shaped by the reception of the Platonic theory of love, which became known to the Latin West through the translations of Plato's works by Marsilio Ficino. Plato's conception of love, found in his *Symposium* and *Phaedros*, initiated a lively debate that flourished in humanistic circles, princely courts, and the newly founded academies. Gradually, the writings about love constituted a specific genre, the so-called *trattati d'amore*, a movement that provoked also critical responses, as can be found in the *contra-amores* treatises. From a philosophical perspective, the works by Marsilio Ficino, Leone Ebreo (Judah Abrabanel), and Giordano Bruno are the most relevant and original. Ficino emphasizes the metaphysical notion of love as a binding principle of the cosmos, as well as love's impact on the striving for self-perfection of the individual. Leone Ebreo and Giordano Bruno both put the focus on the metaphorical use of the language of love to explain the operations of the mind while searching for truth and knowledge. Although the two characteristic features of the philosophical debate of love during the Renaissance, namely, the literary writing style and the glorification of love, went out of fashion in early modern philosophy, we can still find some traces of the Renaissance speculation about love in later thought, from Spinoza to the early romantic period in Germany.

New Impulses: The Reception of Plato's Theory of Love

The philosophical discussion of love during the Renaissance was strongly shaped by the reception of the Platonic theory of love, which became known to the Latin West through the translations of Plato's works by Marsilio Ficino (Hankins 1990). Plato's conception of love, found in his *Symposium* and *Phaedros*, initiated a lively debate that flourished in humanistic circles, princely courts, and the newly founded academies. Although several famous Renaissance philosophers contributed to the debate on love, it was not part of the university teaching, nor was it limited to philosophical analysis. Rather, it was related to the larger intellectual public. The Platonic theory, which related originally to homoerotic relationships, was applied to new contexts, and hence transformed, and served to shape the civil conduct of men and women in private and public relationships, such as in Pietro Bembo's *Gli Asolani* (1505) or in Castiglione's *Il cortegiano* (1528). Gradually, the writings about love came to constitute a specific genre, the so-called *trattati d'amore* (Zonta 1912), provoking also critical responses, as can be found in the contra-*amores* treatises, such as that of Bartholomeo Sacchi (1540) or Battista Fregoso (1581) and (Ciavolella 1976).

The Philosophical Interest of the Writings on Love

From a philosophical perspective, the works by Marsilio Ficino, Leone Ebreo (Judah Abrabanel), and Giordano Bruno are the most relevant and original. Ficino provided an influential interpretation of the Platonic concept of love in his commentary on the *Symposium* (Ficino 2002). Ficino's commentary, written in the literary form of a representation of a *Symposium* in Florence with friends of Ficino, makes use of Neo-Platonic and Christian thought and draws on medical and magical traditions as well on the genres of interpreting love poems. Ficino emphasizes the metaphysical notion of love as a binding principle of the cosmos (*copula mundi*, Ficino 1944, 152),

as well as love's impact on the striving for self-perfection of the individual. Ficino is also following Plato when he states that what humans truly love is beautiful, which is understood as splendor and a spiritual gift (Ficino 1944, 169, 173). And like Plato, Ficino sees the paradigmatic relationship for true love as that between two men. However, Ficino introduces a specific qualification, which became very influential: beauty can be perceived only through our minds, eyes, and ears. Thus, also true love should be restricted to these senses.

Although Ficino's Neo-Platonic approach, which was taken up by his student Francesco Cattani da Diacceto (1561), marks the beginning of the philosophical debate on love during the Renaissance, it does not define the scope of this debate. Also, other philosophers contributed with writings on love inspired by alternative philosophical thought, such as the Aristotelian Agostino Nifo (1531) or Francesco Patrizi da Cherso (1963). Leone Ebreo and Giordano Bruno each provided original interpretations of the concept of love inspired by, but not limited to, the Platonic heritage.

Leone Ebreo's *Dialoghi d'amore* (1535), although written in dialog form, resembles a comprehensive *Summa* of the philosophical investigations of Love, covering all the relevant conceptual aspects of love. Relying on Jewish traditions, Leone challenges the paradigm of love as desire for what one is lacking, prominent in the Platonic tradition. Instead, Leone focuses on the joy of the union with the beloved. Repeatedly he defines love as "desire to enjoy in union an object recognized as good" (Ebreo 1937, 49, 54, and 242).

The intention of Giordano Bruno's work *Degli eroici furori* (1585), written as a combination of the dialog form with that of commentaries to love poems, is "to present divine contemplation, and [...] the furors not of ordinary but of heroic love" (Bruno 2002, 936). Bruno emphasizes that what distinguishes the heroic lover is his excessive desire for truth and knowledge. Leone Ebreo and Giordano Bruno both put the focus on the metaphorical use of the language of love to explain the operations of the mind while searching for truth and knowledge (Ebbesmeyer 2012).

Impact and Legacy

The writings about love generated in Florence, spread during the sixteenth century throughout Italy (Ebbersmeyer 2002; Nelson 1958) and had also a major impact on French literature (Festugière 1941). Although the two characteristic features of the philosophical debate of love during the Renaissance, namely, the literary writing style and the glorification of love, went out of fashion in philosophy in the early modern period, we can still find some traces of the Renaissance speculation about love in later thought, from Spinoza (Gallicet Calvetti 1982) to the early romantic period in Germany (Matuschek 2002).

Abstract

The classicist, cartographer, and Lutheran theologian Eilhard Lubinus taught classical

poetry and theology at the University of Rostock. In his philosophical work *Phosphorus* (Lubinus 1596), Lubinus was influenced by Platonism and Neoplatonism when he formulated a conception of theodicy based on the identification of evil with the nothing from which the world was created. Lubinus's theory was accused of Manichean dualism considering being and the nothing, and consequently good and evil, as two primordial principles, although Lubinus refutes this interpretation by means of a negative specification of evil. His conception forms a background for Leibniz's theory of theodicy.

Biography

Lubinus started his university studies in Leipzig and continued at Lutheran universities in Köln, Helmstedt, Strasbourg, Jena, and Marburg. He finished his education in Rostock, where he obtained a master's degree in 1591. Lubinus spent the rest of his academic career at the University of Rostock. In 1595, Lubinus became a professor of poetry there and, consequently, as a classicist, published commentaries and paraphrases on Persius, Juvenal, and Horace, a Latin translation of Anacreon, and an anthology of Greek letters. His dictionaries of Classical Greek *Antiquarius sive priscorum vocabularum interpretatio* (Lubinus 1594) and *Clavis Graecae linguae* (Lubinus 1609) became very popular and were republished multiple times. In 1605, Lubinus was nominated professor of theology at the University of Rostock in spite of earlier accusations of Crypto-Calvinism and Manicheism -being formulated during controversies around his philosophical book *Phosphorus* (1596, 1601)-, because of its dependence on the Calvinist theologian Duplessis-Mornay. In Rostock, Lubinus also presided over, and later

published, a series of disputations on Mornay's *De veritate religionis christianae* (1601–1602). In the realm of theology, Lubinus published commentaries on the New Testament, especially on the Epistles of the Apostles, and an influential trilingual edition of the New Testament. In the first two decades of the seventeenth century, Lubinus was further elected a dean of the theological faculty and a chancellor of the University of Rostock. In this period, he also became known as a cartographer due to his maps of the island Rügen and of Pomerania (Skrycki 2013).

Heritage and Rupture with Tradition, Innovative Aspects

In the book entitled *Phosphorus* (Lubinus 1596, 1601), Lubinus follows St. Augustine, Plato, Platonism, and Neoplatonism in general (Leinkauf 2009). He was also influenced by Philippe de Mornay's critique of Aristotelian scholasticism (Schmidt-Biggemann 1973) and by his idea that the Supreme Being is opposed by the nothing as a source of evil, in a concordance with the Augustinian conception of evil as the absence of good (Schmidt-Biggemann 1987).

Lubinus creates an ontological system in which the Supreme Being as infinite power, identified with good, rests on the highest level, while the nothing and evil – as an infinite deficiency – is posited on the lowest level. This conception can be called the “ontology of opposite” for the nothing is considered an absolute opposite of the being. It has a substantial impact on Lubinus' theology and anthropology as well, since the nothing and evil can be viewed as the precognition of existence, knowledge, and salvation (Leinkauf 2009).

As a consequence of his critique of Aristotelianism, Lubinus held in the realm of natural philosophy so-called metaphysical atomism considering space, time, and motion as consisting of indivisible minima (Meier-Oeser 2001).

Impact and Legacy

Apart from influential maps of Pomerania, which were reprinted many times, Lubinus' edition of the New Testament had a strong impact on Jan Amos Comenius. In his textbook *Orbis pictus*, Comenius adopted from the Lubinus' edition the idea of multilingual presentation of topics for pedagogical purposes.

Lubinus' philosophical work *Phosphorus* was attacked by the Lutheran theologian Albert Grauer, who accused him of Crypto-Calvinism and Manicheistic heresy. Grauer warned against Platonism, as well as against philosophy leading to dualism, and advocated for Aristotelianism as a philosophy in concord with Christianity. Lubinus' conception was positively accepted by the reformed theologian Bartholomaeus Keckermann but later was again refuted by Leibniz (Hübener 1985) and in the eighteenth century by Jean Paul (Schmidt-Biggemann 1973).

Lucretius

Born: c. 99–93 BCE, Rome

Died: Before February 54 BCE, Rome

Ada Palmer

Abstract

Lucretius was a first-century BCE Roman poet whose didactic epic poem *De rerum natura* (*On the Nature of Things*) is the longest surviving ancient treatment of Epicurean philosophy (Hankins and Palmer 2008). In addition to valuable rustic Latin language, the poem contains details on Epicurean materialism, atomism, and pleasure-centered ethics, as well as rejection of Providence, divine action, and the immortality of the soul. It strongly influenced Renaissance literary language, political theory, ethics, science, and medicine. The poem stopped circulating after the ninth-century CE but was rediscovered in 1417 and disseminated rapidly. It survives in 54 Renaissance manuscripts, and 30 editions were printed before 1600. In the fifteenth century, it was primarily studied in Florence, Venice, Rome, Naples, and Spain. Its impact in France increased in the mid-sixteenth century and in England in the seventeenth century. Long before its recovery, the poem carried a stigma thanks to Epicureanism's association with atheism, sensuality, and sin. This increased as its materialism, radical theology and ethics came to be associated with such infamous figures as Machiavelli and Thomas Hobbes. Renaissance figures

influenced by Lucretius include Bartolomeo Scala, Pomponio Leto, Marsilio Ficino, Poliziano, Marcello Adriani, Machiavelli, Edmund Spenser, Girolamo Fracastoro, Michel de Montaigne, Francis Bacon, Pierre Gassendi, John Donne, John Milton, Thomas Hobbes, Lucy Hutchinson, and Margaret Cavendish. Lucretius's Renaissance rediscovery is frequently discussed in histories of heterodoxy, atheism, and radical belief, particularly since Lucretius holds several beliefs which are now associated with modern secular humanism.

Synonyms

De rerum natura; Lucretianism; Titus Lucretius Carus

Introduction

The epic poem *De rerum natura* (*On the Nature of Things*), by the Roman Epicurean Titus Lucretius Carus (c. 99–c. 55 BCE), is by far the longest treatment of Epicurean philosophy surviving from antiquity and one of the best surviving examples of rustic or archaic Latin style. It seems to have had few readers in antiquity or late antiquity (Butterfield 2016, 46) and stopped circulating after the ninth century, but returned abruptly when the Florentine humanist Poggio Bracciolini (1380–1459) brought a complete manuscript to Florence in 1417. Since Epicureanism had long been associated with irreligion and hedonism, the poem was sometimes a subject of criticism or censorship, but it was received eagerly by scholars, who produced 54 Latin manuscripts and 30 print editions by 1600.

The *De rerum natura* describes the Epicurean position that pleasure is the highest good. It claims that the gods are real but do nothing and are unaware of prayers, and it rejects any idea of divinely ordered creation or Providence. It advocates materialism; ascribes all Earthly phenomena to the interactions of atoms; offers atomist explanations for many natural phenomena, such as disease and magnets; and describes the natural

development over time of animal species and human societies, beliefs, and institutions. It rejects the immortality of the soul, removes the divine completely from the realm of ethics, and fiercely criticizes the “superstition” of Roman religion. Many of these doctrines are frequently compared to modern-day secular humanism and scientific atheism. Consequently, in addition to exerting considerable influence on literature, poetry, and science, Lucretius is often discussed in histories of heterodoxy and debates over the Renaissance's place in the development of modern thought (Del Lucchese et al. 2011; Paladini 2011; Piazzzi 2009; Wilson 2008).

Biography

Little is known of Lucretius's life. He was educated, a Roman, and on intimate terms with Sulla's son-in-law Gaius Memmius, to whom he dedicated and addressed the *De rerum natura*. Renaissance scholars credited the dubious statement in Jerome's translation of Eusebius that Lucretius went mad from drinking a love potion, wrote the poem in lucid intervals between mad fits, and eventually killed himself, and that his work was posthumously edited by Cicero (*Chronicon* a. Abr. 1923–4, 149 Helm). Jerome dates the suicide to 51–50 BCE and Lucretius's birth to 94 BCE, while Donatus places Lucretius's death (he does not mention suicide) on the day Virgil assumed the *toga virilis*, in 55 BCE (*Vita Virg.* 6). Since an unfinished work is unlikely to have circulated during a poet's life, Lucretius's death can be more reliably dated to before Cicero read the poem, which he discussed in a letter to his brother Quintus dated February 54 BCE.

Heritage: Pre-Renaissance Knowledge of Lucretius

The *De rerum natura* was both famous and infamous in Europe well before the poem's return in 1417. Three ninth-century manuscripts – the Codex Oblongus, Codex Quadratus, and fragmentary Schedae – testify to a Carolingian effort

to circulate the poem (Butterfield in Norbrook et al. 2016, 47–50). In the later Middle Ages, Lucretius was known through references in other authors. He was praised by Ovid (*Amores* 1.15.23–24) and Cicero (*Epist. ad Q. fr.* 14.2.9) and recommended by Quintilian (X.1.87). Quotations from the poem were available to medieval scholars in the works of Pliny the Younger, Macrobius (through whom Lucretius was known to Petrarch and Boccaccio), Aelius Donatus, Aulus Gellius, Servius, Priscian, and others (Palmer 2014a; Butterfield 2013). Lucretius was ferociously criticized by the Christian apologist Lactantius, who called him the most worthless poet (*poeta inanissimus*) in his attacks on Epicureanism (*Divinae inst.* 3). Lucretius's reputation was tied to that of the Epicurean school, so improved by positive discussions in Cicero and Seneca and tarnished by negative ones in Arnobius and Ambrose. Brief references to Lucretius in Italian, French, German, and English writings from the later Middle Ages show that these fragmentary sources spread Lucretius's name widely (Solaro 2000).

Heritage: Recovery

The complete *De rerum natura* was one of the many manuscripts Poggio Bracciolini discovered while searching remote libraries after his time at the Council of Constance (1414–1418), when the deposition of his patron antipope John XXIII (1370–1419) left the former apostolic secretary jobless. Poggio's letters do not name the monastery where he found the poem, nor is it certain what manuscript he found, though it was likely a tenth-century copy of the Codex Oblongus (Butterfield 2016, 50). Poggio sent his transcription of the poem to the Florentine book collector Niccolò Niccoli (1364–1437). Increasingly plaintive letters composed over 17 years testify to Poggio's unsuccessful efforts to retrieve his Lucretius from Niccolò or even extract a copy (Gordan 1974). Poggio also recovered other works with references to Lucretius, including Statius (*Silvae* 2.7.76), Cornelius Nepos (*Atticus* 12.4), the remainder of Quintilian (1.4.4–5), and

Tertullian, with his ferocious attacks on Epicureanism; these circulated for several years before the *De rerum natura* was liberated by Niccolò's death in 1437. Humanist readers of the poem quickly identified lines which had been copied from Lucretius by Virgil and read Virgil's interest in Lucretius as a powerful endorsement.

Heritage: Manuscript Dissemination

Renaissance manuscript production maps out Lucretius's initial reception (Fleischmann 1960; Palmer 2014a). Florence was the epicenter. Three illuminated manuscripts were produced for the Medici family and others for Medici bank manager Francesco Sassetti (1421–1490), the Pazzi family, and Piero Vettori (1499–1585). Another was sent from Florence to King Matthias Corvinus of Hungary (1443–1490). Paper manuscripts produced in Florence include one used by Angelo Poliziano (1454–1494), another associated with Marcello Adriani (1464–1521; Brown 2010), and a third transcribed by Machiavelli (1469–1527). Lucretian ideas appear in the surviving works of Florentine statesman Bartolomeo Scala (1430–1497). Scala's daughter Alessandra – herself a poet and Greek expert – married the Greek-born scholar-poet Michael Tarchaniota Marullus (1458–1500), who undertook a set of much celebrated annotations on Lucretius, which were never published due to his death by drowning during the campaign against Cesare Borgia. Venice was another Lucretian center (Davidson 2016). Two manuscripts were owned by Venetian patrician bishops of Padua, Pietro Barozzi (1441–1507) and Jacopo Zeno (1460–1481), and Padua was also the origin of the manuscript created for John Tiptoft Earl of Worcester (1427–1470) which in 1461 was the first Lucretius manuscript to enter England (Butterfield 2016, 51). Venetian territories also produced all four incunabular print editions of Lucretius. In Rome, Lucretius was studied extensively by Pomponio Leto (1428–1498) and his circle (Dixon 2011). Leto's student Giovanni Sulpizio da Veroli (Verolano; active c. 1470–1490) transcribed two complete manuscripts, and many of

Leto's annotations were reproduced in a manuscript belonging to the Swiss jurist and humanist Bonifacius Amerbach (1495–1562). Lucretius manuscripts were also owned by Pius II (1405–1464), Sixtus IV (1414–1484), Fulvio Orsini (1529–1600), and Francesco Marescalchi of Ferrara – a correspondent of Poggio, Ficino, and Leto's teacher Lorenzo Valla (1407–1457). Outside Italy, Lucretius diffused fastest in Spain, thanks largely to connections with Naples (Vera 2009). One lavish manuscript was created for Ferdinand I of Naples (1424–1494), another bears the arms of Aragon, and a third bears the arms of the Neapolitan condottiero Andrea Matteo Acquaviva (1456–1528). Two other manuscripts were sent to Spain, a further two created in Spanish-controlled Neapolitan territory, and another used by Antonio Beccadelli (Panormita; 1394–1471) while he was in the service of Alfonso V.

Heritage: Printing and Translation

The Brescia *editio princeps* (c. 1473) was riddled with errors, as were the 1486 Verona and 1495 Venice incunables, which were all superseded by a corrected Aldine quarto edited by Hieronymus Avancius (Venice, 1500). In 1511 in Bologna, Johannes Baptista Pius (1460–1540) produced the first annotated edition (Nicoli 2015). The 1515 Aldine octavo, edited by Aldus's son-in-law Andrea Navagero (1483–1529), was the last in Aldus's revolutionary series of pocket-sized classics, produced in the year of the great printer's death, but it was undercut by Florence's Giuntine press, which produced an octavo Lucretius in 1512 in a format imitating Aldus's. The 1515 Aldine was the last Lucretius printed in Italy for 132 years. The general northward migration of printing to new centers in France (La Renaissance de Lucrèce 2010) and the low countries coincided with a ban on teaching Lucretius and other "licentious" literature issued by Florence in 1517 (Palmer 2014a). French reprints of Navagero's text dominated through the 1550s, including a flurry of tiny pocket copies printed in the 1540s (Sacré 1994). In 1563, Parisian Aristotelian

Denys Lambin (1520–1572) published a corrected text accompanied by a massive 300,000-word commentary (Tsakirópoula-Summers 2001, 32). Lambin's text dominated until the eighteenth century, rivaled only by the practical classroom editions of his hated rival Gifanius (Hubert van Giffen, 1534–1604, first printed 1565–1566).

Vernacular translation of Lucretius started with the 1650 French translation by abbot Michel de Marolles (1600–1681) (Fleischmann 1960). Shortly thereafter Lucy Hutchinson (1620–1681) completed the first English verse translation, a work she never published and undertook – she said – in order to understand Lucretius's ideas fully enough to reject them (Barbour and Norbrook 2012). An anonymous prose translation of the same period (Bodl. MS. Rawl. D. 314) rivals her claim to be Lucretius's first English translator. John Evelyn (1620–1706) published Book I of his complete verse translation in 1656, but the edition was so botched by the press that he refused to publish more. In 1669 Alessandro Marchetti (1633–1714) – professor of mathematics at Pisa – completed an Italian verse translation, but was denied permission to publish in 1670 by the newly crowned Grand Duke Cosimo III of Florence. The translation was nonetheless extremely popular, circulating widely in manuscript, after it was printed posthumously in a 1717 edition with no printer's name and "Londra" (London) on the title page – almost certainly a clandestine Italian product. In 1682 Thomas Creech (1659–1700) published a complete English translation, lacking only the Book IV sex scene, which was among the Lucretian excerpts translated by John Dryden (1631–1700) in his 1685 *Sylvae*. De Wit's Dutch edition appeared in 1701, a German version in 1784, and other vernaculars in the nineteenth century (Gordon 1985).

Reception: Radicalism and Censorship

The idea of Lucretius's Renaissance recovery as a cause or epicenter of radical heterodoxy was reignited in 2012 when Stephen Greenblatt's

account of Poggio's discovery of Lucretius, *The Swerve*, received the Pulitzer Prize (Greenblatt 2009). Many who read the poem did indeed hold radical views, or had run-ins with the Church and other authorities, but many of their unorthodox beliefs bear little similarity to the modern secular humanism so often linked to Lucretius. The Florentine Christian Platonist Marsilio Ficino self-censored his Lucretianism, burning in horror his youthful writings on Lucretius and rebutting Lucretius's arguments against the immortality of the soul in his *Theologia Platonica* (Gentile 2017; Hankins 2017). Early editions of Lucretius consistently state in introductions and paratexts that the poem's "absurd" Epicurean "errors" will not be dangerous to the learned reader. Some scholars read these comments as dissimulation, adopted as self-defense by closet radicals (Brown 2010, Prosperi 2007), while others read them as sincere indifference to the poem's radical content on the part of scholars interested primarily in the epic's language and information about the ancient world (Palmer 2014a; Davidson 2016). Lucretius's name is virtually absent from Inquisitorial archives, and Lucretius was not added to the Roman *Index* of banned books until Marchetti's Italian translation threatened to expose Italy's less learned readers to Lucretian content at the beginning of the eighteenth century. A 1557 letter of Michele Ghislieri (Pope Pius V, 1504–1572) – a formative figure in the history of the Roman Inquisition – warned that the *Index* must be careful not to target harmless literary fables such as Lucian, Lucretius, *Orlando Furioso*, and the *Decameron* (Palmer 2014a, 37, 274–5 n 108).

Thanks to Lactantius and others, Epicureanism had long been associated with wickedness, sensuality, and sodomy. Such associations may have contributed to Pomponio Leto's 1466 imprisonment in Venice on sodomy charges and the prosecution of his academy by Pope Paul II. The language of the 1517 Florentine ban on teaching Lucretius lumped the poem in with "licentious" materials, which may reflect association with sodomy or may refer to the passage in Book IV – often omitted by early translators – where Lucretius describes sexual intercourse, fertility, and contraception (Goldberg 2009). In 1575 Paduan

poet Sperone Speroni (1500–1588) was denounced to the Inquisition partly because of the licentiousness of his *Dialogo d'amore*, which used Lucretian sexual imagery (Prosperi 2007). During the Reformation, two Italian imitators of Lucretius were prosecuted for Protestant sympathies. The head of the Neapolitan Accademia Pontaniana, Scipione Capece (1480–1551) – who later accepted voluntary exile from Naples because of his Lutheran sympathies – imitated Lucretius's verses but argued against his materialism in his 1535 *De principiis rerum*. Aonio Paleario (1503–1570), a courtier of Leo X and professor of Greek and Hebrew, who was burned at the stake for pro-Protestant heresies in 1570, composed a verse defense of the existence of God and the immortality of the soul styled on Lucretius, titled *De immortalitate animorum* (1536). At the end of the sixteenth century, Giordano Bruno (1548–1600), who held Epicurean-influenced views including atomism, was burned at the stake for heresy, yet Bruno's trial records indicate that Inquisitors associated his heresies with Aristotle rather than Lucretius (Davidson 2016). Lucretius's connections with later radicals are more solid. Michel de Montaigne (1533–92) engaged very deeply with Lucretius, especially his ethics (Screech 1998). Through Montaigne's influence, Lucretius became popular with French radical *libertins* of the seventeenth century, such as Cyrano de Bergerac (1619–55), and later with radical *philosophes* of the eighteenth century, such as Voltaire and Baron d'Holbach (Kors 2016). Lucretius also gained infamy through association with Machiavelli and the materialism of Thomas Hobbes (1588–1679).

Innovative Impact: Poetry and Art

The *De rerum natura* was eagerly studied by students of Latin poetry and style. Poliziano used Lucretian imagery of the gods in his *Stanze per la Giostra* (1475–8) composed for Giuliano de' Medici (1453–1478). The poem's opening image of Mars napping on the lap of Venus influenced Botticelli's "Mars and Venus," while Lucretius 5.735–50 has been suggested as a

source of Botticelli's "Primavera" (Lane-Spollen 2015). Lucretian images appear in the *Apologium* of Florentine statesman and Medici ally Bartolomeo Scala (1430–1497) and also in the paintings in the Scala family palazzo (Prosperi 2007). Lucretius's prayer to Venus excited interest as early as Pomponio Leto's annotations and was imitated by Matteo Maria Boiardo (c. 1434–1494), Luigi Alamanni (1495–1556), Francesco Berni (c. 1497–1535), Bernardo Tasso (1493–1565) in his *L'Amadigi* (Prosperi 2004), his son Torquato Tasso (1544–1595) in his *Gerusalemme liberata* (1581), and Edmund Spenser (c. 1552–1599) in *The Faerie Queene*. Perhaps the most famous image in the poem is the comparison of a poet disguising difficult ideas in sweet verses to a doctor smearing honey around the rim of a cup of bitter wormwood medicine to trick a child into drinking it. This image was known from other classical sources, but Lucretius's suggestion that poetry could honey-coat much-feared Epicurean ideas threatened humanist claims that the beautiful language of antiquity would teach true things, never false. The passage was of particular interest to Machiavelli (Palmer 2014a).

Lucretius influenced many French poets, especially from the 1540s, when Paris and other French printing centers poured out a flurry of Latin editions. In the sixteenth century, snippets from Lucretius were employed by associates of the poetic group *le Pléiade* including Jean-Antoine de Baïf (1532–89), Remy Belleau (1528–77), Guillaume de Salluste Du Bartas (1544–99), and especially Pierre de Ronsard (1524–85; Ford 2007). Through Latin editions and Marolles's French translation, Lucretius was widely known in England well before the first English translations. Lucretius was referenced by Ben Johnson (1572–1637), George Sandys (1577–1644), John Donne (1573–1631), John Milton (1608–1674), and many other lights of sixteenth- and seventeenth-century English literature (Hardie 2009). Shakespeare (1564–1616) frequently deployed atomic imagery in similes, clearly expecting atomism to be familiar to his audience (Passannante 2011). Lucretius's impact in Spain was also substantial and is only beginning to be explored (Vera 2009; Durin 2013).

Innovative Impact: Politics and Ethics

The *De rerum natura* repeats many commonplaces of classical eudaimonist moral advice, paralleling Stoic admonitions about the dangers of love, the pain caused by strong emotion, and the value of tranquility (Palmer 2014a). Such passages were enthusiastically received by humanists and fit well with syncretic efforts to depict the schools of ancient philosophy as fundamentally compatible with each other and Christianity. Many figures attempted to rehabilitate Epicurus's ethics while rejecting his views on the soul and the divine, as in the cases of Capece, Paleario, the self-proclaimed "Christian Epicurean" Pierre Gassendi (1592–1655), and the *Discours de Morale sur Épicure* of Jean-François Sarasin, composed in 1655–6, which states that pious Christians are the best Epicureans because, through austerity and refraining from sin, they achieve eternal pleasure after death. Far more radical was the Earthly focus of Epicurean ethics. Unlike Stoics and Platonists, Epicureans framed an ethics concerned exclusively with this world, pleasure, pain, and the consequences of actions during an individual's life. Before the return of Lucretius, the idea of such a pleasure-centered ethics was of interest to Lorenzo Valla, but the first figure to employ a similarly Earth-centered moral system was Machiavelli in his revolutionary consequentialist ethics (Rahe 2007).

Machiavelli also made use of Lucretian politics. Book V of the *De rerum natura* contains a developmental account of the origin of human society, religion, and government, describing how humans once lived simply, like beasts, but gradually developed cities, property, government, law, and religion. This passage provided a radical alternative to the dominant political understanding of states as divine creations, and Machiavelli employed it in several of his works. Both through Machiavelli and directly, this passage influenced the political theories of Francis Bacon (1561–1626) and Thomas Hobbes, and powerfully affected European attempts to understand the societies they encountered in the New World. Both Lucy Hutchinson and Thomas Creech, in

translating the passage, used Lucretius's ideas of the natural evolution of states to frame and come to terms with the tumults of the English Civil Wars, especially the regicide (Norbrook 2016).

Innovative Impact: Science and Natural Philosophy

Scientific engagement with Lucretius lagged behind poetic engagement. Lucretius's description of the Athenian plague in Book VI had strong medical appeal, and, along with Lucretius's descriptions of epilepsy and drunkenness, it was frequently excerpted or annotated by readers with medical interests. It was a physician, the Florentine Giovanni Nardi, who in 1647 produced the first edition of Lucretius printed in Italy in 132 years, containing his short commentary, *Paraphrastica explanatio*. Lucretius was also used as a model for the composition of scientific poetry, often by authors who rejected his ideas but wanted to use his techniques to honey-coat their own, as in the cases of Paleario, Capece, the scientific works of the French poet Maurice Scève (c. 1500–c. 1560), and *The Anatomy of Melancholy* of Robert Burton (1577–1640). Girolamo Fracchetta's 1589 vernacular *Breve spositione di tutta l'opera di Lucretio* focused on illustrating where Lucretius commits "errors" by differing from Aristotle. In 1745 Cardinal Melchior de Polignac (1661–1742) published *Anti-Lucretius*, a Latin verse epic based on rebutting what the cardinal saw as Lucretius's central errors.

Positive scientific engagement with Lucretius's Epicurean ideas was extremely rare before the seventeenth century. The physician Girolamo Fracastoro (c. 1476–1553) followed Lucretius in ideas as well as form in his epic poem *Syphilis sive morbus gallicus* (1530), which presented Fracastoro's revolutionary contagion theory of disease (Goddard 2003; Maurette 2014). In it Fracastoro used atomist elements, Lucretius's rejection of immaterial causes, and Lucretius's developmental models of nature and animal species. After the execution of Giordano Bruno, an English admirer of his work, Nicholas

Hill (1570–c. 1610), published *Philosophia Epicurea* in Paris in 1601 (Gillespie 2007). The first self-labeled Renaissance Epicurean was Pierre Gassendi, who advanced a theologically orthodox modified atomism as an alternative to Aristotelianism, which, by the early seventeenth century, was losing credibility thanks to new discoveries. In England, Lucretius influenced the scientific thought of Bacon, Hobbes, and Walter Raleigh (c. 1554–1618), as well as Henry Percy Earl of Northumberland (1564–1632) and the scientists he supported, including Thomas Hariot (1560–1621), Robert Hues (1553–1632), Walter Warner (1563–1643), and Nathaniel Torperley (1564–1632; Gillespie 2007). Lucretian ideas featured in the natural philosophy of Margaret Cavendish (1623–1673) and of her correspondent the physician and anatomist Walter Charleton (1619–1707). A friend of Hobbes, Charleton, translated Gassendi and voiced naturalist and atomist theories in his own *Epicurus's Morals* in 1656. In the later seventeenth century, anxiety about Hobbes's materialism dominated discussions of Lucretius and apologetic projects like those of Creech and Charleton aimed to counter attacks such as that of Ralph Cudworth, who lumped Lucretius, Epicurus, and Hobbes together as supreme atheists.

Abstract

Known as one of the greatest Christian theologians of the XVI century and as one of the most important figures in the Protestant Reformation, Martin Luther not only offered a concrete answer to the spirit of renovation of his age, but he also set the agenda for many subsequent philosophical and theological problems. His theological proposal, in spite of having been mainly inspired by St. Augustine of Hippo and Ockham's Nominalism, prompted a new understanding of mankind and of Grace,

which can be consequently seen in his theory of justification and his theology of the cross. For Luther, indeed, nothing in mankind is free from sin. Hence, justification cannot be found in human righteousness but in God's righteousness: salvation is not something to be earned but something to be received. Before the Augustinian conception of man, according to which human beings are *partim bonum, partim malum*, Luther upheld the position that man is *simul iustus et peccator*. Given this peculiar condition of humankind, it follows that all human action is the fruit of a sinful desire and that, therefore, only God's grace justifies the sinner. The emphasis is not placed so much on that which the agent does or fails to do externally, but on the faith that moves him, i.e., the inner subject. With this in mind, Luther contributes to laying the foundations for the Cartesian *cogito*.

Biography

Martin Luther was born on November 10th, 1483, in Eisleben, a village in Saxony, and he was christened the next morning after St. Martin of Tours, following the tradition at the time. His family would soon move from Eisleben to Mansfeld, where his father, Hans Luther, would gain a relative success as the lessee of some mines and a copper smith, the reason why Luther would display a very early devotion for St. Anne. From a very young age, Luther was raised in a very strict manner both at home and at school, focusing on the fear of God and the reverence for the Church (Bainton 1978). In addition to this, his father longed to see Luther become, under all circumstances, a lawyer, the reason why his initial education was spent studying Latin grammar, rhetoric, and logic. Hence, he studied in three different places: Mansfeld, Madeburg, and Eisenach.

In accordance with his father's desires, Luther would enroll at the University of Erfurt in 1501, where he would take the basic courses to obtain a Master's degree in liberal arts, and, subsequently, he would enroll at the Faculty of Law in Erfurt. In July 1505, however, he abdicated his studies in

order to become an Augustinian monk, a decision that would later be attributed to a vow made on July 2nd of that year during an electric storm: "Save me, St. Anna, and I shall become a monk" (Brecht 1985). Beyond the mere fear of dying hit by lightning, this vow and its firm resolution of becoming a monk answer the constant afflictions – *Anfechtungen* – that tormented him about his own salvation. During this first stage of his life, Luther would constantly seek in vain confession: "He confessed frequently, often daily, and for as long as six hours on a single occasion" (Bainton 1978).

After having been ordained priest in 1507, Luther would obtain a Bachelor's degree in Biblical Studies, on March 9th, 1508, and another one in 1509 related to the study of the *Sentences* of Peter Lombard. In 1510, he would travel to Rome as part of a delegation of his monastery in order to be part of the negotiation of the Augustinian order. When he came back, he was transferred from Erfurt to Wittenberg, where he received, in 1512, the title of Doctor of Theology. After this event, Luther took Johann von Staupitz's teaching position as a professor of Biblical Theology (Hendrix 2015). Through the influence of the latter, who was Vicar-General of the Augustinian order and superior of an Augustinian monastery in Wittenberg, Luther would begin his first lectures on the Palms in 1513 and his commentary on Romans in 1515. In addition to having presented a significant part of his theory of justification, these comprise some of his first criticisms of the theology of his age.

These criticisms would take force, especially between 1513 and 1515, particularly through his lectures on St. Paul – Romans and Galatians – and the constant sermons against indulgences and the collection of relics associated with this practice (Bainton 1978). Being tired of the abuses generated by the sale of indulgences and the accompanying political interests (e.g., Albert of Brandenburg's archiepiscopate, member of the house of Hohenzollern), Luther wrote his famous *Ninety-Five Theses*. In Bainton's (1978) opinion, this text contains three fundamental criticisms: "an objection to the avowed object of the expenditure, a denial of the powers of the pope over purgatory, and a consideration of the welfare of

the sinner". Even though at the beginning it was a text whose sole objective was to generate an academic confrontation and not a harsh rupture with Rome, its prompt translation from Latin into German and its wide diffusion, first in Germany and then throughout Europe, contributed to its consideration as a direct attack to the Papacy.

While some theologians like Sylvester Mazzolini were declaring Luther's proposal as heretical, Luther was assisting his order in Heidelberg, where he would later polish his position (Whitford 2001). Later, in October 1518, Luther would appear before Cardinal Cajetano, who was the Papal Legacy at the time. Cajetano's mission was simple: to either make Luther recant his position or to arrest him and take him to Rome, a task which he would not undertake (Mullett 2004). For this reason, in 1519 Pope Leo X assigned Karl von Miltitz, Papal harbinger, to gain the approval of Fredrick the Wise, Luther's main protector. He, nonetheless, would reject the Pope's gifts – a golden rose – and would appeal to his just crowned nephew Charles V, emperor of the Holy Roman Empire in order to get an audience for Luther and safe-conduct that would warrant his safety during the audience.

In 1520, thus, three significant events took place: first of all, the Papal Bull *Exsurge Domini* on July 15th, where the threat of excommunication had become evident if Luther did not recant his position; second, the writing of three important texts for his theology – *To the Christian Nobility of the German Nation*, *On The Babylonian Captivity of the Church*, and *On the Freedom of a Christian*; and finally, Luther's public burning of the Papal Bull. All of this would culminate in Luther's excommunication through the Bull *Decet Romanum Pontificem*, published on January 3rd, 1521, and the Diet of Worms, an event that Charles V would offer to the audience at Fredrick the Wise's request. During the latter, Luther would refuse one more time to retract his position with the following words: "Unless I am convinced by the testimony of the Scriptures or by clear reason (for I do not trust either in the pope or in councils alone, since it is well known that they have often erred and contradicted themselves), I am bound by the Scriptures I have quoted, and my conscience is captive to the Word of God.

I neither can nor will retract anything, for it is neither safe nor honest to go against one's conscience" (Brecht 1985).

After having obtained the support of four out of six electors, Charles V would sign the Edict of Worms, which would generate nonconformity in various regions of Germany where Luther's influence was remarkable. Fredrick the Wise, after having learned of the Imperial Prohibition, would hide Luther in the Castle of Wartburg, in spite of the fact that Luther opposed his plan. During his stay at Wartburg, Luther would devote himself to translating the *New Testament* from Greek into German: although his translation was not the first translation into vernacular language, it would fit perfectly with the spirit of the age. After going back to Wittenberg in 1522, not only would Luther face the challenges endemic to the Reformation itself, but also, he would face the violence generated by some radical reformers who wanted to turn the Protestant Reformation into social reform. These radical movements would culminate in 1525 after losing Luther's support and the Battle of Frankenhausen. That same year, Luther would marry Katharina von Bora, one of the twelve nuns that would abandon the Cistercian monastery. Finally, Luther died in Eisleben on February 18th, 1546, after a series of ailments like dizziness, tinnitus, arthritis, and angina pectoris.

Heritage and Rupture Within the Tradition

Luther's heritage and rupture within the tradition can be appreciated in his conception of sacraments, an aspect of his theology that requires historical context. His theology of the sacraments was made in reaction to his context and has a polemical emphasis. Luther saw himself, in this regard, as a virtuous middle point between the Anabaptists and Zwingli on one side and the Roman Catholic doctrine on the other side. However, Luther's theology has some distinctive features that are consistent with his other theological ideas and surpass the polemical tone.

Luther numbered the sacraments in two: baptism and the Lord's Supper. For Luther, there are

only two sacraments because he believed that these two were the ones that are “promises which have signs attached to them” (Luther 1970). He excluded the other traditional sacraments as allegories. Sacraments are defined by Luther’s theological principles: “Sola fides, sola Scriptura, sola gratia” the signs and the word help the faith make visible the signs of God’s work and thus translate into acting grace. The Augsburg Confession, fully approved by Luther, states: “there are two parts to a sacrament, the sign and the Word. In the New Testament the Word is the added promise of grace” (Skevington Wood 1960). However, Luther differs from the Roman Catholic doctrine that the sacrament dispenses grace *ex opere operato*, i.e., in an objective way that does not imply the faith of the recipient. For Luther the sacrament is inactive if there is no faith involved: “Since we are indeed justified by faith, it follows that the sacraments are not efficacious except through faith” (Luther, M. 1883–2009; 44:719).

Luther defended, against the Anabaptists and Zwingli, that Baptism is essential for salvation, but he differed from the Roman Catholic belief that the grace of baptism operates even when there is no conscious faith in whom receives it. For the Catholic belief, the faith is there, even in an a posteriori and not fully conscious manner. This topic is, however, open to debate, as Luther accepted that faith might not necessarily be conscious, and still God is always free to act. Another aspect of Luther’s emphasis on the necessity of baptism is the fact that mankind is condemned in sin, and only the radical cleansing of baptism can put humans in the way of justification.

In the case of the Lord’s Supper, Luther’s theology preserves the belief in the “real presence of Christ” in the sacrament. However, in the *Babylonian Captivity of the Church*, he rejects the Catholic doctrine of transubstantiation, which for Luther is a pernicious influence of the “Aristotelian Church” (Luther 1970, 144). Luther’s explanation of the real presence is explained in terms of “consubstantiation,” the Eucharistic species are there with their accidents, but the presence of Christ is there too. Luther thinks this is the simplest and straightforward way of understanding the Lord’s words, and he applies a nominalist

interpretation of the presence: individual bread and individual person cohabitate in space and time through the sacrament.

Innovation and Original Aspects

A relevant innovation in his thought involves the rethinking of anthropology in terms of a new theological approach. Luther’s early theology was greatly influenced by the epistemological Nominalism and the *pactum*-theology of the *via moderna*, which was extremely prevalent during his day and age (McGrath 2011). The *via moderna* along with a much deeper comprehension of the Epistle of Romans and St. Augustine’s theology laid the foundation for Luther’s doctrine of justification, which was formed on the basis of a covenantal, rather than an ontological, understanding of the nature of righteousness. For Luther, this article of justification was the one doctrine upon which the Church would stand or fall.

Previous to Luther’s theology, most theologians understood righteousness as something *infused* in the believer. After this infusion took place, it was necessary to make a habit of virtue through which one would grow in righteousness. Therefore, the believer’s righteousness was seen as something belonging to his nature. This understanding of the process of justification was related to St. Thomas Aquinas theological insights, which incorporate the Aristotelian notion of the habit of virtue. For this reason, when Luther writes his *Disputation Against Scholastic Theology* (1517), he states in his 41st thesis, “Virtually the entire *Ethics* of Aristotle is the worst enemy of grace. This is in opposition to the scholastics” (Luther 1955–1986, LW 31). Consequently, Luther advocates for a return to the Holy Scripture and to the early church fathers, the former having preeminence over the latter. This reaction was prompted by what Luther thought was an important deviation from the right doctrine of justification. This deviation was the doctrine of infused righteousness.

Nevertheless, Luther’s radically new understanding of righteousness involves the fact that

the *iustitia Dei* was externally *imputed*, i.e., justification is a forensic declaration that the believer is righteous, which amounts to a change of *status*, not a change of man's *nature* (McGrath 2000). Hence, Luther sees the believer as a sinner, whose nature is sinful, but also as a sinner who has been fully justified by God's grace. In this sense, Luther would never allow righteousness to be something within the believer but alien and external to him. This Pauline concept of "imputed righteousness," as understood by Luther, amounts to a significantly new interpretation of righteousness established within an Augustinian soteriological framework (McGrath 2000). This new interpretation is so important that the Reformation doctrine of justification, in general, becomes unintelligible apart from this interpretation.

As a result, Luther's view of man is quite different from that understood by Thomism in general and the *via moderna* in particular. On the one hand, for the late medieval theologians following Aquinas, there were at least four soteriological factors that were implied in the teachings of justification. First, there was the infusion of grace; this means that God makes (merely) the first move. Second, there is the movement of free will towards God in faith, i.e., humans have free will and can move towards God by the use thereof. Third, the movement of free will takes effect in recoil from sin. Fourth, there is remission of sin through this process, and humans' will is part of this process. To Luther, these points represent the theology of glory. In his 21st thesis of the *Heidelberg Disputation Theological Theses* (1518) he states, "A theologian of glory calls evil good and good evil. A theologian of the cross calls the things what it actually is" (Luther 1955–1986, LW 31).

Luther teaches something radically different from Thomistic teaching. First, there is no infusion of righteousness; rather, there is a non-imputation of sins or an imputation of righteousness, i.e., *iustitia Christi aliena* understands that God does not merely make the first move but he does everything, from beginning to end. Second, free will is nonexistent when one talks about the things "above man," i.e., even though humans can

freely make choices in their daily lives, when one talks about matters of salvation, human beings have no will in virtue of being creatures (Packer 1999). Hence, in the 39th thesis of his *Disputation Against Scholastic Theology* Luther states, "We are not masters of our actions, from beginning to end, but servants. This is in opposition to the philosophers" (Luther 1955–1986, LW 31). Even though Luther cannot, strictly speaking, be considered to be a determinist in the same way as Thomas Hobbes because it does not involve all human action, he did believe that there is no free will when talking about salvation. This is a vital point if one wants to understand the *theologia crucis* in general and the conflict with Erasmus in particular. While Erasmus saw the issue of the will as somewhat trivial and peripheral, Luther saw this issue as pivotal for soteriology (Packer 1999). Given human's sinful nature, humans can only act according to their will, which in turn will act according to its nature. Therefore, without God's grace there is nothing good that can be done. Even those virtues that one considers good from an external point of view are evil, because they do not acknowledge God's grace and are attempts at earning grace. In his *Heidelberg Disputation Theological Theses* Luther explains, "Although the works of man always appear attractive and good, they are nevertheless likely to be mortal sins" (Luther 1955–1986, LW 31). Third, when humans realize that they are unable to do anything good out of their sinful, bound will, the real recoil takes place, and this is also the work of God. Finally, the remission of sin is not something that humans have any say in, not even faith saves them per se, i.e., justification is *propter Christum* not *propter fidem* (McGrath 2000).

Consequently, Luther's emphasis on God's sovereignty cannot be overlooked when one looks at both his anthropology and his theology. However, even though Luther seems to be belligerent towards philosophy and reason at some points, he simply believes – like many of the medieval theologians and philosophers – that theology and philosophy are two quite different realms, and, thus, they should not interfere with each other's matters of study. When reason takes its proper place, it is good. As Luther states in his

fourth thesis of the *Disputation Concerning Man* (1536), “And it is certainly true that reason is the most important and the highest in rank among all things and, in comparison with other things of his life, the best and something divine” (Luther 1955–1986, LW 34). However, if reason is not subservient to God and the Scriptures, then the one who uses it is a theologian of glory, and he has “wisdom which sees the invisible things of God in works as perceived by man [and] is completely puffed up, blinded and hardened” (ibidem).

Abstract

Simone Luzzatto was the chief rabbi of the Jewish community of Venice and a renowned scientist whose works were highly praised among scholars and colleagues of his time. His fame increased during his rabbinate, as he became the author of several critical texts and contributor to the debates about Jewish law (*Halakha*), which constitute his works in Hebrew. His immense erudition ranged from the natural sciences to the humanities: rabbi and intellectual, he had a scholarly talent for classical Latin and Greek culture and also was a passionate reader of medieval and contemporary Italian authors. Luzzatto's main works are written in Italian. In 1638, he published the *Discorso circa il stato degli Hebrei*, a small apologetic treatise written with the goal to show the social, political, and economic importance and usefulness of Jews for Venetian welfare. It is his first and most known work and has

been thoroughly examined by various Jewish and Christian scholars, thus leaving a still lasting impact on the following of Jewish thought. His second work, *Socrate overo dell'humano sapere*, printed in 1651, is a philosophical work in the tradition of skeptic thought, which still remains quite enigmatic. The political and philosophical thinking of the rabbi explores the relations between the Republic of Venice and the ghetto, contributing to a new concept of Jewish identity and its social and cultural role within Christian society.

Biography

A wide range of modern and contemporary sources helped to paint a more complete picture of the rabbi's life, not least because his own writings don't reveal much information aside from short allusions. Only in 2011, the discovery of his last will and testament dating back to 1662, provided some new information concerning his family and his material possessions. Simone Luzzatto was born in Venice between 1580 and 1590. He descended from a very rich and well-known Venetian family of great cultural and economic prestige, also proven by the fact that Luzzatto's family members married exponents of the most prominent Jewish families of Venice. This is also confirmed by the rich heritage he left to his grandchild Moisè Luzzatto in his last will. The Luzzatto family originally came from the Lausitz region in the northeast of Germany (S. D. Luzzatto 1878); therefore, it was probably part of the Ashkenazi Jews who populated the ghetto of Venice in 1516. According to some sources, he received his ordination at the age of 24 (Luzzatto S. 1950/1951) and he acted as rabbi of the synagogue of the "Scuola Grande Tedesca," in attendance of the Jewish-German community, until the end of his life. Documents of Inquisition's processes mention him as having been rabbi until 1661 (Ioly Zorattini 1980/1997). We know from a letter of the rabbi and writer Isaac Cantarini to the Christian Hebraist, Christoph Theophil Unger, that he died in 1663 (Wolfius 1727) and also contains an anecdote about how his too heavy

gravestone submerged into the ground of Venice's Lido cemetery.

Writings in the Hebrew Language

In accordance with his position as a rabbi, Luzzatto was the author of a considerable number of Halakhic responses about issues concerning the Jewish law (*responsa*), which constitute the corpus of his Hebrew works, but his name also appears in several documents as *poseq* (who has decisional power concerning rabbinic laws issues), as *maskin* (someone who granted the *nihil obstat*), or as a wedding witness (his sign was found on some marriage contracts). He signed several approvals for Jewish book publications. Some of his contemporaries referred to him as the author of some other works (Delmedigo 1629) that unfortunately were never found.

Mish'an mayim (Venice, 1606)

The *Mish'an mayim* ("The water support") constitutes his most important religious-legal response. It is part of a collection of texts printed in the volume *Mashbit milchamot* ("End of the virulent discussions") in Venice in 1606 as the result of a difficult Halakhic dispute about the purity of a *miqwe* (a bath for ritual washing) in Rovigo. Luzzatto's opinion comes as the last of seven responses written by different Venetian rabbis. The *Mish'an mayim* is a well-structured text divided into three parts and introduced by a detailed index of the topics, in which the rabbi argues in favor of the adequacy of the place of ritual.

Responsa

Five very short of Luzzatto's responses are collected in the volume *Nachalat Ya'aqov* ("Ya'aqov's heritage"), put together by the rabbi Ya'aqov Heilbronn, whose disciple Luzzatto was. Each response starts with a dedication to rabbi Heilbronn and debates different topics, such as transporting a dead body on Saturdays, the issue of extramarital relationships, and financial issues, especially concerning usury. One of the shortest responses, but at the same time very important to

the rabbi, examines the controversy between rabbi Heilbronn and other rabbis, who accused him to be a follower of the Kabbalah, disapproved by the majority of the Italian rabbis of early modernity. The last religious-legal opinion deals with an economic argument between two brothers, Shim'on and Re'uven. Most of Luzzatto's responses concerning civil, family, inheritance, and ritual law were discovered in manuscripts of different origins (Luzzatto S. 2013).

Introduction to the Commentary of Ecclesiastes and Job's Books

Although Luzzatto hasn't left us any biblical and Talmudic commentary, a short introduction to a commentary of Ecclesiastes and Job's Books was discovered. This introduction was published in 1656 in *Tzafnat pa'neach* ("The revelation of secrets") by Samuele ha-Cohen from Pisa. Though it is a very short text, here Luzzatto debates the very controversial topic of Job's intentional denial of the resurrection of the dead. By examining the biblical and Talmudic passages, Luzzatto argues in favor of Job's protest against God, showing it to be a manifestation of the human freedom to criticize mankind's condition in this world.

Writings in Italian Language

Discorso circa il stato degli Hebrei (Venice, 1638)

Luzzatto's political thought is expressed in a short treatise, *Discorso circa il stato degli Hebrei et in particolare dimoranti nell'inclita Città di Venetia* (Discourse on the condition of the Jews with particular reference to the Jews dwelling in the noble city of Venice), printed in 1638 in Venice by Giovanni Calleani. This book is a refined apology of the Jewish Venetian community and a request for tolerance probably written as a response to the crisis which broke out in 1636 after a robbery committed also by some Jews of the ghetto (Shulvass 1949). A pending threat of expulsion of the Jews seems to be one of the reasons for Luzzatto's commitment to this work. The rabbi seeks to describe and justify the role of the Jewish

community within Christian society. By arguing in favor and giving examples of the socio-economic value of the Jewish presence in Venice, but implicitly also of broader Christian society, Luzzatto moves beyond a mere *petitio* and starts a real political discourse based on utilitarian conceptions. The *Discorso* is divided into 18 chapters called "*considerazioni*" (considerations) and comprises two separate sections. In the first one (consideration I to X), Luzzatto claims the highly developed economic skills of the Jews to be necessary presuppositions for the commercial activity in Venice, defending the importance of their role in Venetian economy. He deals extensively with issues such as trade, moneylending, collective wealth, and the role of the Jewish community in the city of Venice and thereby underlines the remarkable aptitudes Jews show in increasing the wealth of the city. Reading these passages, it becomes evident how proud and satisfied the rabbi was with the excellent level of economic and social achievement of the Venetian Jews. The second section (consideration XI to XVIII) centers on the topic of a possible expulsion of the entire Jewish community as punishment for the crimes of a few single individuals and seeks to avoid it. To this end, he proceeds to systematically refute all arguments, referring to the Bible or to Christian and political criticism, in favor of expelling Jewish communities from European cities. Luzzatto also praises the notable intellectual engagement of the Jewish community, describing its active participation in the philosophical debates of the time. In conclusion, one could say that Luzzatto proposes and defends in his treatise a political message of the trustworthiness of the Jews, confirmed by their long history of loyal respect for the Venetian constitution.

Socrate overo dell'humano sapere (Venice, 1651)

Luzzatto published his major work, *Socrate overo dell'humano sapere. Esercizio seriogiocoso di Simone Luzzatto hebreo venetiano. Opera nella quale si dimostra quanto sia imbecile l'humano intendimento, mentre non è diretto dalla divina rivelatione* "Socrates or on human knowledge. The serious-playful exercise of Simone Luzzatto,

Venetian Jew. A work that shows how imbecilic human intelligence can be, when it is not led by divine revelation), in Venice in 1651 at the Tomasini's printing house. The book comprises 316 pages of text, followed by a list of the discussed topics. The text is divided neither into chapters nor into paragraphs. However, there are some margin annotations, which somehow act as guidelines pointing out changes in topic, interlocutors, and the transition from direct to indirect speech.

The purpose of this later treatise is to show the weakness of human knowledge by systematically employing the method of skeptic doubt. However, it is a kind of theological skepticism, which only concerns human cognition, exempting divine knowledge and revelation from this concept of skeptic doubt. Luzzatto defines divine revelation as the only trustworthy knowledge and denies the authority of sciences and the reliability of the instruments of human cognition. The rabbi entrusts Socrates and many other philosophers and known figures of classical Greek thought with the task to conduct this inquiry into human knowledge in order to show that the only acceptable consequence, because it is not dogmatic, of this thought is the suspension of judgment. The entire book is designed as a new fictional apology by Socrates, who had been accused of trying to devalue human sciences. He defends himself by enumerating the reasons which led him to suspect that human scientific discipline lacked certainty. He claims that the controversial opinions of scholars on principles, objects, instruments, and functions of knowledge are at the origin of his doubts about the reliability of the human sciences. By adopting the method and developing the main concepts of ancient and modern skeptic philosophy, this work represents a refined proof of the Venetian Jewish reception of the skeptic modern tendencies of the early modernity in Europe.

Reputation and Cultural Legacy

The political thinking of the Venetian rabbi was well received and also criticized by his followers and indirect disciples. The originality of his

apologetic treatise consists of a new approach to the issue of the place of the Jewish community within Christian society. Luzzatto adopted the Machiavellian concept of *utilitas* and *necessitas* to strengthen and highlight the economic role and social position of Jews in society (Veltri 2011a). His ideas and arguments played a significant role in the thinking of some Jewish and Christian authors. Luzzatto's *Discorso* was a source of inspiration to Menasseh ben Israel, who implicitly adopted it in his *De fidelitate et utilitate Judaicae gentis libellus anglicus* (Ravid 1982), but also for Spinoza, who indirectly criticized his political thinking (Veltri 2008). A certain proof of the influence of Luzzatto's book is given by the deist John Toland who read it and planned to translate it into English. Considering the interest that Toland and Menasseh ben Israel showed in the political thinking of Luzzatto, it is probable that Moses Mendelssohn was influenced by the *Discorso* for his *Jerusalem*. It's important to mention Johann Friederich Herder among the voices that express a direct acknowledgment of Luzzatto's theory (Veltri 2013).

The legacy of Luzzatto's skeptic thinking is more difficult to trace: *Socrate overo dell'humano sapere* is not very well known, since there exist only very few copies of the original book and it was republished again only in 2013, after its last publication in 1651. There are some allusions to Luzzatto's *Socrate* in the world of scholarship, but no scholars have referred to this work in its entirety. Among the first who paid attention to Luzzatto's thinking was the historian Henrich Graetz. He examined the rabbi's philosophical work in an attempt to show the necessity of reason and revelation to complement one another (Graetz 1998), recalling the traditional doctrine of the equilibrium between *fides* and *ratio*. Also, Shmuel David Luzzatto proposed a summary of the *Socrate* dealing just in passing with the topic of his skepticism (Luzzatto S.D. 1878). There exist only three more recent contributions to the study of Luzzatto's *Socrate*: David Ruderman in his *Jewish Thought and Scientific Discovery in Early Modern Europe* summarized *Socrate*'s contents, focusing on the difficult problem of Luzzatto's sources and his place in the context of

modern thinking and Jewish scholarship. The dissertation of Ariel Viterbo, partly published in Italian in 1997, should also be considered because it deals with the book by describing its contents and proposing to interpret the *Socrate* as an intellectual biography of Luzzatto. The last contributions to the research also on this still a rather enigmatic book were edited by Giuseppe Veltri, who (S. Luzzatto 2013; Veltri 2015) suggests considering this work as a unique Jewish contribution concerning the skeptic tendencies of European early modernity. This interpretation invites the recipient to evaluate *Socrate* as proof of the Jewish participation in the philosophical debate of the time and thus the Jewish active role in building the modern European culture.

Abstract

John Lyly was a writer, playwright, and courtier in the service of Elizabeth I.

Biography

Lyly was educated at Oxford University (BA, 1573; MA, 1575) and had aspirations of returning to Oxford as a fellow at Magdalen College. His first two works, *Euphues: The Anatomy of Wit* (1578) and *Euphues and His England* (1580), were written to display his humanist credentials and promote his ambitions as a university scholar. After the *Euphues* duology and letters to Lord Burghley failed to secure him an academic position, Lyly went on to pursue a career in London, eventually turning to court service and writing plays. The dedication of *Euphues and His England* to the Earl of Oxford led to a patronage relationship which supported Lyly's court plays: *Campaspe* (1584), *Sapho and Phao* (1584), *Gallathea* (1588), and *Endymion* (1591). His last three plays, *Midas* (1591), *Mother Bombie* (1594), and *The Woman in the Moon* (1597) – the only Lyly play written in blank verse – stand apart from the earlier plays, especially in their treatment of servants who dominate the action. Of the additional works that have sometimes been attributed to Lyly, only *Love's Metamorphosis* is reliably credited to him; although believed to be Lyly's first play, it was not printed until 1591. During the last years of his life and even after the death of Elizabeth, Lyly only wrote "begging letters," in which he famously complained about a lack of reward for his royal service. He left London briefly

(1562–1565) for financial reasons near the end of his life but returned and remained there until his death in 1606.

Heritage and Rupture with Tradition

Lyly is often associated with humanism, which his grandfather William Lily was partly responsible for bringing to England and popularizing through his grammar textbook and founding role in St. Paul's School. The extent of the younger Lyly's continuation of his scholarly inheritance and commitment to humanism are debated among scholars, as is the degree of sycophancy in Lyly's early court plays. Far from seeing Lyly's dual identifications as mutually exclusive, some critics have argued that his "humanist ideals" and "appeal for royal patronage" are related, complementary sources of motivation (Alwes 2000).

Innovative and Original Aspects

Lyly's first two works were written in an ornate literary style that came to be known as Euphuism. This unique style quickly made him one of the most fashionable writers in England and gained prominent followers including Robert Greene, Thomas Lodge, and Thomas Nashe.

Impact and Legacy

By 1590, Euphuism had largely died out. The reaction against Lyly's excessive mannerism was first expressed in Philip Sidney's *Astrophel and Stella* (1591) and later parodied as Italianate and pedantic in such works as William Shakespeare's *Love's Labor Lost* (1598). Although *Euphues* continued to be reprinted after the 1590s, by then its literary clout and popularity had already diminished considerably.

After giving up on his prospects for a university career, Lyly found only partial success advancing to the royal court, not least because of

his connection to the Earl of Oxford, who both brought Lyly closer to his goal and threatened it with his own troubled relationship to the Queen. Lyly's court career remained vexed and financially unsatisfying throughout most of his life; he was given numerous titular honors without stipends. Although Lyly clung to the hope of becoming Master of Revels at Gray's Inn, his connections to the Earl of Oxford and Martin Marprelate put him at odds with powerful political factions and ordinances which likely precluded his advancement.

Lyric Poetry in the Renaissance

Abstract

The study of Renaissance lyric poetry cannot be separated from the linguistic hegemony of Latin in the fifteenth century and the gradual establishment of the vernacular in the sixteenth century. In fact, in the fifteenth century, vernacular lyric poetry flourished side by side with Latin lyric poetry, in which the revival of the classical poets interacted with vernacular sources and most of all with Petrarch. However, by the sixteenth century, vernacular lyric poetry was firmly established, divided into two opposing trends: the petrarchist, which found its highest expression in the theories of Pietro Bembo, and the anticlassicist and antipetrarchist.

Heritage and Rupture with the Tradition

The pre-eminence of Humanism in the fifteenth century marked the success of Latin, and Latin poetry also flourished in the field of lyric poetry, flanking the revival of the classics with a profound interaction with vernacular sources and especially with Petrarch's *Canzoniere*. The poetry of intellectuals such as Angelo Poliziano, Giovanni Pontano, Jacopo Sannazzaro, and Michele Marullo combined classical forms and motifs with the expression of an existential reality that had been the focus of Petrarch's poetry. Poliziano is the paradigmatic case: author of some of the best-known humanist Latin lyric poems, such as the elegies *In Lalagen* and *In violas*, he also devoted himself to vernacular poetry with the composition of *Stanze*, in which classical linguistic and mythological elements merge with vernacular echoes; the atmosphere in which the poet's

alter ego Julius lovingly contemplates Simonetta is rendered through elaborate stylistic preciosity.

By the sixteenth century, literature in the vernacular was well established, and petrarchist lyric poetry – proposing the styles and themes of Petrarch – contrasted with antipetrarchist poetry, which often displayed comic elements in its attempt to overthrow classical forms stylistically and linguistically as well as in content. It was Pietro Bembo whose precise dictates codified Petrarch in the role of model for poetry in *Prose della volgar lingua* in 1525, in which he opposed the *flamboyante* drift of much of late fifteenth-century petrarchism and proposed a “return to Petrarch.” Concrete examples of precepts set forth in *Prose* are Bembo's *Rime* published in 1530, characterized by a uniform style in clear imitation of Petrarch, and the revival of the themes of the *Canzoniere*, albeit lacking their intensely dramatic quality and reinterpreted in the light of Renaissance Neoplatonism and its devaluation of the sphere of the body in the *furor amoris*.

The greatest representatives of Renaissance antipetrarchism, characterized by the revival of comic and obscene elements parodically aiming to overthrow the traditional *topoi*, were Pietro Aretino, Nicholas Franco, and Francesco Berni. Franco's *Priapea* (1541), a collection of ribald anticlerical poems, and Aretino's *Sonetti lussuriosi* (composed between 1525 and 1527) constitute anti-*Canzoniere*, in which obscenity and bodily references take the place of Petrarch's disembodied yearnings for the beloved. But the contrast was not only thematic: also from a stylistic and linguistic point of view the overturning of petrarchist “fashion” can be seen, clearly illustrated by Franco in his 1539 dialogue *Il petrarchista* and by Berni in his playful rhymes, where Petrarch's stylistic elements and language are parodied, arousing in the reader a sense of estrangement.

In the course of the century, petrarchism became a true literary phenomenon, crossing the Italian border to arrive throughout the rest of Europe: poets such as Pierre de Ronsard and even Philip Sidney and William Shakespeare, albeit in an original and complex manner, felt his influence.

Ronsard, who aspired to revive lyrical poetry in France, made Petrarch one of his most important sources and used his stylistic elements and images in a creative way, merging them with those of classical authors such as Horace. It emerges that in this case, Petrarch's poetry became an expressive "alphabet" to which he was drawn, constantly renewing it and combining it with other sources.

In England, petrarchism had a great following and left deep traces in the works of prominent poets such as Philip Sidney and William Shakespeare. Astrophil, the lover in Sidney's collection of poems *Astrophil and Stella* (1591), is depicted as the Petrarchist lover par excellence, desperate in his hopeless yearning to possess an intractable woman. Sidney, however, is not a mere imitator of Petrarch; he inserts into the collection a major structural novelty, which allows him to bestow on Petrarchism a renewed introspective feeling. This novelty consists in the paroxysmal accentuation of the metapoetic element: in addition to telling a love story, the collection is a reflection on the writing of love poetry itself, and Stella is also evoked as a reader of the poet/lover's compositions. Within the context of this meta-reflection, any criticism of the particular euphuistic flavor of the poems in the collection is paradoxical. In this way, Sidney succeeds in creating a fundamental imbalance between his expressed theoretical position and his convoluted and Bembesque practice, displaying a possible strategy of overcoming *ab interno* the Petrarchian code of love that, in the repetitions of his imitators, had lost all reflective momentum. Shakespeare's approach to Petrarchism also exhibits remarkable originality; subject to sarcastic criticism in many theatrical works, the Petrarchist code undergoes a radical reversal in the section of the *Sonnets* dedicated to the Dark Lady. In direct opposition to the neoplatonizing concept of disincarnate love, his tone not dissimilar to that adopted in 1585 by Giordano Bruno in the *Eroici furori* (edited in London), Shakespeare places the erotic and physical force of a promiscuous woman in the very foreground.

The petrarchist "revolution" also arrived in Spain, with poets like Garcilaso de la Vega and

Lope de Vega. If the former's poems are characterized by the balance they maintain between the desire for originality and imitation, creating a personal synthesis of reason and feeling, in the complex works of Lope de Vega his adhesion to Petrarchism coexists with its parody. In fact, the *Rimas humanas* is a Petrarchist collection, especially remarkable for its many formal variations and the presence of other themes besides love (classical, mythological, biblical, artistic), and the *Rimas sacras* are a reproposal of the collection in the Petrarchist manner – where, however, the object of love is not a woman but God. On the other hand, the *Rimas humanas y divinas del licenciado Tomé de Burguillos* are a parody of Petrarchist *topoi*, pilloried in ways not unlike those adopted by Italian antipetrarchism.

In conclusion, we can state that the "Petrarch factor" played an indispensable role in the poetry of the Renaissance, and the poets of the time compared themselves with the poet from Arezzo, in imitation or parody.

Biography

Johannes Maccovius was born in Poland near Poznan and belonged to the Polish aristocracy. He studied liberal arts at Gdansk under the tutelage of the rector Bartholomaeus Keckermann. As tutor of two young noblemen, Maccovius went to the Netherlands, where he received his doctorate at Franeker University. In 1616 he became professor there, both in theology and physics. In 1618 he came in conflict

with his fellow professor Sybrand Lubbertus, who accused Maccovius of 50 errors, and brought these accusations to the national Synod of Dordt (1618–1619). A committee of six theologians declared Maccovius free of heresy, but admonished him “to speak with the Prophets, Christ, and the Apostles, rather than with Bellarmine, Suarez, and the like”. During his lifetime, Maccovius married three times. His first wife was Antje Ulenborgh, sister of Saskia, Rembrandt’s wife. Possibly, Rembrandt had Maccovius in mind when painting his “Portrait of a Polish Rider.”

Writings

Maccovius’ publications originated from his lectures. His most popular work is *Distinctiones et regulae theologicae ac philosophicae*, posthumously published ten times in the seventeenth century and translated into Dutch (1658) and English (2009). It was a classroom book for students trained in the *artes* faculty and starting their theological education. The distinctions are thought to be helpful for understanding and defending Christian doctrines. So, Maccovius promoted conceptual analysis in order to gain as much clarity as possible.

Key Ideas

Unlike many of his Reformed colleagues, Maccovius never was a preacher. His focus was

strongly on academic theology. Thanks to his thorough training in philosophy, he was an able polemicist. This brought him to a rigorous application of philosophical instruments to the field of elenctic theology. More than most of his Reformed contemporaries, Maccovius made use of medieval concepts and distinctions. For example, Maccovius, defined reprobation as twofold – negative and positive – identifying God’s will as the cause of negative, human sin as the cause of positive reprobation. The first means that somebody is not elected, the second that he is ordained to punishment.

Legacy

For a long time, Maccovius had a bad name in the historiography of Reformed Theology. One cause was that in later Remonstrant historiography (the Remonstrants were those who were expelled from the Synod of Dordt), the Maccovius affair was used to criticize the Reformed view on predestination. Another cause was the incorrect thought that the Reformation was intrinsically anti-scholastic, so that Maccovius’ use of scholastic methodology was a betrayal of the Reformational Theology. Thanks to new research in Reformed Scholasticism (with Willem van Asselt and Richard Muller as main authors), there arises more sympathy for Maccovius’ work. All recent studies on Maccovius belong to this new approach.

Abstract

During his successful career as second chancellor of the Florentine Republic following the

expulsion of the Medici from the city (1494), Machiavelli had the chance to meet famous Italian lords and foreign rulers, as well as to observe their political conduct closely. When the Medici were restored to power in 1512, he was removed from his position and banished from Florence. It was in this moment of failure and despair that Machiavelli combined his past experience as secretary with the study of the classical authors to write those masterpieces (*Il principe*, *Discorsi*, *Mandragola*, *Istorie fiorentine*) that made him the best-known author of Renaissance Florence. Whether defined as a statesman, a humanist, a historian, or a philosopher, Machiavelli fits all these descriptions in a unique way. Although he is today remembered chiefly for his advice, contained in the treatise *Il principe*, to disregard ethics while pursuing or preserving power, his thought and output are much more complex than this but have been obscured by the negative reception his political works received in the aftermath of his death. Far from any systematic investigation, Machiavelli rejects any doctrine based on traditional and Christian values and strives to find the constant laws of politics by examining current events through a comparison of these with ancient history.

Biography

Over the past 20 years, several biographies of Machiavelli have been published perfecting the more rigorous approach first adopted by Ridolfi half a century earlier (Ridolfi 1954). Mention is made of these in the present section, which is above all indebted to the accurate and detailed entry in the *Dizionario Biografico degli Italiani* (Inglese 2006a).

Little is known about Machiavelli's childhood and early youth. Born to Bernardo di Niccolò di

Buoninsegna, who was a moderately successful doctor of law, and Bartolomea de' Nelli, he had two elder sisters, Primavera and Margherita, and a younger brother, Totto. His father's diary, *Libro di ricordi* (Olschki 1954), which spans the years 1474–1487, records the early stages of Machiavelli's study of Latin grammar (at the age of 7) and of arithmetic (at 11), as well as in Latin translation under the tutelage of Ser Paolo Sasso da Ronciglione (from 1481). In this diary, one can find a list of the books that were in the Machiavelli household, including historical works by Livy, Marcus Junianus Justinus, and Flavio Biondo, as well as rhetorical and philosophical writings by Cicero (*Philippics*, *On the Orator*, *On Moral Duties*) (Ridolfi 1954). At the time of the savage reprisals perpetrated by Lorenzo de' Medici against the instigators of the Pazzi conspiracy, in which Lorenzo's brother, Giuliano, was assassinated, Machiavelli was only 9 years old (Viroli 2000). Unfortunately, in contemporary documents there is no trace of Machiavelli's later studies. It is probable that in his youth he transcribed Lucretius' *De rerum natura* and Terence's *Eunuch* and attended the tutorials or lectures of Marcello Virgilio Adriani, who taught poetics and rhetoric at the university, the Florentine Studio, from 1494. However, it is clear from his first writings that, along with a sound knowledge of the fourteenth- and fifteenth-century Tuscan literary tradition, he had a solid humanist education (Black 2013). There is no evidence for his knowledge of ancient Greek: allusions to Greek authors found in his writings may derive either from translations into Latin or from oral communication with experts.

During the years of the republic established after the expulsion of the Medici in 1494, Machiavelli was drawn toward the oligarchic faction in opposition to the leadership of the Dominican friar Girolamo Savonarola. This association might explain his election as secretary of the second chancery on 19 June 1498, just 1 month after Savonarola's execution (23 May). As second chancellor he was in charge of the administration of the city's relations with its subject territories, while foreign affairs were handled by the first chancery under the direction of Virgilio Adriani.

From 14 July Machiavelli was also appointed secretary to the magistracy of the Dieci (Ten) dealing with military and policy matters. The tasks entrusted to him included carrying out informal embassies, gleaning information, and dealing with minor problems prior to the arrival of the official ambassadors (chosen from members of elite families). It was during his governmental career (1498–1512) that Machiavelli had the chance to meet Italian lords and foreign rulers and acquire the experience that was to shape his political thought. His job as envoy is well documented in the extant letters and dispatches sent to the Ten and to the Signoria, the republic's chief executive magistracy (Machiavelli 2001–: v). In this correspondence Machiavelli already gives proof of his intellectual acuity in analyzing political matters. Some of the letters exchanged with his assistants (most notably Agostino Vespucci and Biagio Buonaccorsi) also document a jovial aspect of his personality (Chabod 1993).

Machiavelli's minor political works are also connected to this period. In 1499, he wrote the *Discorso sopra Pisa*, on how to reconquer the city that had rebelled against Florence after Charles VIII's descent into Italy (1494). Subsequently, he was at the court of Caterina Sforza Riario, countess of Imola and Forlì, working to secure her military and political support. After the Swiss and Gascon mercenary troops failed to regain Pisa in July 1500, Machiavelli was sent to the French court with Francesco della Casa (in support of the official ambassadors), in order to discuss the outcome of the battle. On this occasion, he met George d'Amboise, cardinal of Rouen and the King's prime minister. During this 6-month mission (from July 1500 to January 1501), Machiavelli followed the itinerant court of Louis XII observing and studying both the character of the French people and the political and military organization of their monarchy. His reflections on this experience are expressed in the brief essay *De natura Gallorum* (which was revised until 1503).

With regard to his private life, in the autumn of 1501, Machiavelli married Marietta Corsini who gave him seven children: two daughters, Primerana and Bartolomea called Baccia (the

mother of Giuliano de' Ricci), and five sons (Bernardo, Ludovico, Guido, Piero, and Totto).

In the following year, new concerns for the Florentine government came from the actions of Cesare Borgia, Duke of Valentinois, the illegitimate son of Pope Alexander VI. After occupying the Romagna, Borgia invaded Florentine territory. As a consequence, Arezzo and Valdichiana revolted with the support of Vitellozzo Vitelli, the duke's lieutenant. It was the first time Machiavelli, accompanying the ambassador Francesco Soderini, bishop of Volterra, met Borgia. These events inspired the speech *Del modo di trattare i popoli della Valdichiana ribellati* (July 1503), in which the uncertain approach of the Florentine government to handling the situation of Arezzo is bitterly compared to the wise conduct used by the ancient Romans against the rebellious Latin peoples.

The election of Piero Soderini as lifetime *gonfaloniere* (standard-bearer of justice), on 20 September 1502, was intended to provide the republic with greater stability. Soderini would soon give his leadership a popular imprint in opposition to the oligarchs, making Machiavelli his right-hand man. In the following decade, Machiavelli's prestige increased as would not have been possible for any secretary of the second chancery.

During his second legation to Duke Valentino (October 1502–January 1503), Machiavelli witnessed him trapping and killing his rebellious lieutenants in Senigallia (31 December). This episode was subsequently recorded in *Il modo che tenne il Duca Valentino per ammazzare Vitellozzo, Oliverotto da Fermo, il signor Paolo e il Duca di Gravina Orsini in Senigaglia* (1514–1517). From 26 October to 18 December 1503, Machiavelli attended the conclave in Rome that resulted in the election of Giuliano della Rovere as Pope Julius II. Cesare Borgia, whom Machiavelli blamed for having favored his enemy's ascent, was imprisoned by the Pope while attempting to leave Rome.

At the end of 1504, after a short legation to the French court, Machiavelli composed the *Decennale* or *Compendium rerum decennio in Italia gestarum*, a historical poem in tercets

relating the chief events of the past decade. His purpose was to support Soderini's politics as well as to promote the formation of a Florentine army in order to face the contemporary political crisis. First dedicated to the nobleman Alamanno Salviati, it was subsequently addressed to the Florentine citizens by Agostino Vespucci in his introductory letter accompanying the publication in February 1506. The removal of the original dedication proves Soderini's and Machiavelli's change of disposition toward Salviati. Written in a colloquial style, which emphasizes the bond between the author and his readers, the poem produces a comic effect through animal puns on onomastics and heraldry (Matucci 1978; Bárberi Squarotti 1987; Cabrini 1993).

In 1505 minor missions took Machiavelli to the Lord of Perugia Gian Paolo Baglioni, to the Marquis of Mantua Giovan Francesco Gonzaga, and to the Lord of Siena Pandolfo Petrucci. In the ongoing conflict with Pisa, the failure of the mercenary troops to capture the enemy persuaded Machiavelli even more about the importance of having a homegrown militia. Soderini allowed him to recruit the infantry from Florentine territory defying the opposition of the oligarchs who feared that such an army might increase the *gonfaloniere's* personal power. From the end of August to the end of October 1506, Machiavelli followed Julius II on his journey from Rome to Bologna where the Pope aimed to overthrow Giovanni II Bentivoglio and restore the overlordship of the Church. Arriving in Perugia on 13 September, the Pope did not hesitate to enter the city alone and almost unarmed. Machiavelli's musings on Julius II's boldness and Baglioni's cowardly surrender are contained in one of his most important letters, the epistle to Giovan Battista Soderini (nephew of the *gonfaloniere*) dated 13–21 September, known as *Ghiribizzi al Soderino*.

In January 1507 Machiavelli was appointed as secretary of the Nine, the newly created magistracy in charge of managing the army. After the rumor of an imminent descent of Emperor Maximilian I spread in June 1507, he was allowed to join the ambassador Francesco Vettori on a mission to the imperial court only at the end of the

year. On his return in June 1508, Machiavelli wrote the *Rapporto di cose della Magna* in which he recorded Maximilian's character flaws as a leader, as well as the strengths (based on the "abundance of men, money, and arms") and weaknesses (lack of central power, disunity between emperor, princes, and cities) of the German state. These matters were subsequently examined in the *Discorso sopra le cose della Magna e sopra l'imperatore* (1509) and the broader *Ritratto delle cose della Magna* (1512).

Until June 1509 Machiavelli was busy with the Pisan military campaign and drafted an action plan for the reconquest of the city (*Provvedimenti per la riconquista di Pisa*). Pisa's final surrender was acknowledged by his friends as a success for the militia he had organized.

Meanwhile, major events had upset the political situation in the rest of Italy. On 14 May 1509, the troops of the League of Cambrai promoted by the Pope defeated the Venetians at Agnadello taking possession of most of their territories. In the last months of the year, Machiavelli was first at the court of the Marchioness Isabella d'Este in Mantua and then in Verona to handle minor matters relating to the emperor's descent into Italy.

Two more missions to the French court took place in 1510 and 1511. Machiavelli's report, *Ritratto di cose di Francia*, revised and amplified in different phases until April 1512, underlines the strengths of the French state (in particular its centrality and wealth) as well as its faults including the employment of a weak infantry. After the French were overcome by the troops of the Holy League (formed by the papacy, Spain and Venice) in the Battle of Ravenna (11 April 1512), the Hispano-papal forces entered Tuscany and plundered Prato defeating the Florentine infantry effortlessly. Pier Soderini, persuaded by a few oligarchs to abdicate, fled to Siena by night on 31 August. His behavior in the crucial last days of the Florentine Republic is blamed as cowardly by Machiavelli in the famous and sarcastic epitaph *La notte che morì Pier Soderini* (Carrai 1985–86). On the other hand, the restoration of the Medici is described in positive terms in Machiavelli's letter (without date) sent to an illustrious unknown noblewoman (likely to be identified with the

Marchioness of Mantua unless it should be regarded as a fictitious text). Similarly, in his short memorandum *Ai Palleschi* (as the supporters of the Medici were called) written between October and November 1512, Machiavelli welcomes the return of the Medici encouraging them to continue Soderini's anti-oligarchic politics. Despite his efforts to win their favor, he was soon removed from his position and condemned to banishment within Florentine territory as well as to the payment of bail in the amount of a thousand gold florins. In February 1513 he was imprisoned and tortured after his name was linked to the conspiracy hatched by Pietro Paolo Boscoli and Agostino Capponi against the Medici family. In such desperate circumstances, Machiavelli sought help from Giuliano de' Medici to whom he addressed two burlesque sonnets: *Io ho, Giuliano, in gamba un paio di geti* and *In questa notte, pregando le Muse*. The first ironically describes the awful conditions of his incarceration; the second contains a playful reprimand to one of the muses who has mistaken him for the mediocre poet Andrea Dazzi. Longing to return to work, in another sonnet composed a little later during his banishment (*Io vi mando, Giuliano, alquanti tordi*), he would encourage Giuliano to be wary of those who may speak ill of him.

Eventually released, thanks to the general amnesty following the election of Giovanni de' Medici as Pope Leo X on 11 March 1513, Machiavelli began his famous correspondence with Francesco Vettori, who was then ambassador at the papal court. But the hope that his friend might succeed in finding him employment with the new rulers was thwarted. When everything was lost (*post res perditas*, as Machiavelli put it), he retired to the Albergaccio, his modest property in Sant'Andrea in Percussina, near San Casciano. The letter to Vettori dated 10 December 1513 contains a tragicomic description of his daily life on the farm and the first evidence of the composition of *Il principe*. In reply to his friend's complaint about meaningless tasks in Rome, Machiavelli ironically lists his demanding occupations: farm work, reading poetry, going to the inn, and playing games with the local people. The style of the letter becomes more solemn in the

second part, where Machiavelli relates that in the evening he wears "royal and courtly clothes" and enters into conversation with the ancient authors. *Il principe* is here referred to as a small work *de principatibus* ("on principalities"), which is still being enlarged and revised. After his return to Florence in February 1514, Machiavelli attended the meetings in the gardens of the Rucellai family (known as *Orti Oricellari*), in Via della Scala. There is no consensus about the exact time he began those visits, whether in 1513 – since even during the banishment he went back to Florence for short periods – or a few years later (Stoppelli 2005). At these meetings, members of the Florentine elite (including Luigi Alamanni, Zanobi Buondelmonti, and Lorenzo Strozzi) gathered around the young owner Cosimo Rucellai to discuss literature, history, and politics. The composition of the *Discorsi sopra la prima deca di Tito Livio* is linked closely to that period and that environment, as shown by the dedication to Buondelmonti and Rucellai. In those years of forced inactivity (1513–1520), Machiavelli also explored other literary genres: from theater (*Mandragola*) to narrative (*Belfagor*) and from poetry (*L'asino*) to military theory (*Arte della guerra*).

Even though republican ideals were probably debated in the Rucellai gardens, it would be wrong to consider them as a forum for opponents of the Medici. Indeed, friends from the *Orti* favored Machiavelli's reconciliation with the ruling family so that he was entrusted again with some tasks. In the summer of 1520, he was sent to Lucca to solve a delicate situation involving a few Florentine merchants who had claims against the insolvent Michele di Giovanni Guinigi from that city. During that time Machiavelli wrote the *Vita di Castruccio Castracani da Lucca*, a short biography of the Lord of Lucca and leader of the Tuscan Ghibellines (1281–1328), who was often engaged in conflicts against the Florentines. The presence of several inaccuracies and mistakes has made scholars doubt the specific nature of this work (Brakkee 1986; Inglese 1991; Frazier 2013). Nevertheless, as a result of this piece of writing, in November Machiavelli obtained from Cardinal Giulio de' Medici the official

commission to narrate the history of Florence. The following year he was in Carpi dealing with some administrative matters concerning the Franciscan convents in Florentine territory as well as searching for a good preacher for the following Lent on behalf of the consuls of the wool guild. This episode is attested by Machiavelli's witty correspondence with Francesco Guicciardini, at that time governor of Modena. Back in Florence, Machiavelli devoted himself to writing the *Istorie fiorentine*, which would be presented to Giulio de' Medici, now Pope Clemens VII, in May 1525.

A new anti-Medici conspiracy spearheaded by Alamanni, Buondelmonti, and other attendants at the Rucellai gatherings was discovered in 1522, but there was no evidence of Machiavelli's involvement. His love for the young singer Barbara Raffacani Salutati (whom he met in the property of Jacopo Falconetti known as Jacopo Fornaciaio) is treated with self-irony in the play *Clizia* composed for the carnival 1525. Based on Plautus' *Casina*, the comedy was successfully performed on 13 January in the presence of a large audience including the most illustrious citizens of Florence. Despite its controversial authorship, the *Discorso o dialogo intorno alla nostra lingua*, in which Machiavelli advocates the use of the modern Florentine as literary language against archaic or pedantic tendencies, is generally also dated to this period (Trovato 1982).

The political climate had meanwhile become alarming. After Charles V defeated and captured the French King Francis I in Pavia (on 24 February 1525), Machiavelli was sent by Pope Clement VII to Faenza to discuss his views on the organization of a territorial militia with Francesco Guicciardini (now papal president of the Romagna) but failed to impress him. When the League of Cognac was formed to oppose the emperor (May 1526), Machiavelli was involved in the defense of Florentine territory. In November the imperial forces descended into Italy: Giovanni de' Medici (known as Giovanni dalle Bande Nere), in whom Machiavelli had placed great hopes, was mortally wounded and his troops defeated in the territory of Mantua. After invading Tuscany, the imperial Landsknechts headed for Rome, sacking the city on 6 May 1527. A few

days later, the Medici were expelled from Florence, and the Great Council and the republican institutions were restored. Now unpopular with the new governors because of his recent services to the Medici, Machiavelli was not offered any employment in the second chancery. He died on 21 June (probably of peritonitis) and was buried the following day in Santa Croce. A story has it that on his deathbed, Machiavelli had a dream, in which he met two different groups of men, the first consisting of miserable people on their way to paradise and the second including the damned souls of distinguished thinkers like Plato, Plutarch, and Tacitus. Sharing his dream with his friends, Machiavelli confessed that he would prefer to discuss politics in hell rather than be bored to death in paradise (Ridolfi 1954).

Main Works

Machiavelli's ideas are not expressed systematically as one expects from philosophers, although consistent themes can be found in all his works. His thought rests on a few postulates which are not explained but presented as the foundation for any further political discourse. His view on human nature is pessimistic: men are essentially evil, greedy, ready to overlook the loss of their fathers but not of their property, and ready to do something good only if urged by necessity. Such corruption is not to be improved by human progress but stands as an ontological condition, which those ruling a state (either a principality or a republic) should keep in mind if they intend to preserve and confer benefits on it. The related postulate that men and universal orders have always been the same since time began permits one to identify general laws controlling human existence. Machiavelli's originality lies in transferring the humanist concept of imitation from the artistic and scientific fields to politics. Thus it becomes necessary to examine models of the past in combination with an attentive analysis of contemporary events in order to prevent a state from being ruined. However, other areas of Machiavelli's thought are not so limpid but are liable to different interpretations that continue to inflame controversies among scholars. Machiavelli's evolution from *Il principe* to the

Discorsi, i.e., from a monarchic to a republican phase, has been argued in the past (Baron 1961), but this transition is only apparent, as the two works seem to develop different sides of a more complex political discussion (Inglese 2006b). The conception of politics as the ambition to expand one's own dominion does not belong to Machiavelli's writings either: for him, politics is a continuous effort to preserve the common good limiting the possible damages caused by fortune (Ferroni 2003).

Il principe

The traditional view that *Il principe* was written hurriedly between July and December 1513 (Chabod 1993; Cutinelli-Rèndina 1999; Dotti 2003) has been discredited by other critics who postpone its completion to spring 1514 (Sasso 1987–1997; Inglese 2006b) or even to 1517–1518 (Machiavelli 2001–: 1.1; Bausi 2005). In opposition to the generally consolidated opinion, Martelli argues that Machiavelli has been overestimated both as a political thinker and a humanist since several inaccuracies can be found in the treatise. In his view it reflects the author's subordination to the Medicean government after the downfall of the Florentine Republic (Machiavelli 2001–: 1.1). On the other hand, Inglese firmly believes that the text in the form it has reached us represents a finished work in which innovative political ideas are expressed in an original and effective style (Inglese 2006b).

No autograph manuscripts have survived. It is believed that the Latin titles of the 26 chapters comprising the treatise were also used in the original form, whereas the chapter numbers were added later. *Il principe* was printed posthumously first by the Roman editor Blado and subsequently by the Florentine Giunti in 1532. However, manuscript copies (some made by Biagio Buonaccorsi himself or at his initiative) were already in circulation when the author was still alive. Certain sections of the treatise were used (if not plagiarized) by the philosopher Agostino Nifo in his *De regnandi peritia* (1523).

The chapters are preceded by a dedicatory letter in which, according to the humanist tradition, the author acknowledges his own unworthiness to

offer political advice and praises the patron's greatness. The original dedicatee, Giuliano de' Medici, was subsequently replaced (not necessarily following his death in March 1516) by Lorenzo de' Medici whom Pope Leo X had entrusted with the leadership of Florence in 1513. In this dedication, Machiavelli also proudly underlines the original method of his approach to politics based on the combination of long experience in modern affairs with the continuous study of antiquity. Such political realism reinforced by theoretical reflection prevented him from lapsing into mere empiricism or abstract thought. Another claim to originality concerns his writing style, which rejected unnecessary ornamentation and the florid language typical of contemporary works. The argumentation is based on a series of antithetical descriptions introduced by the disjunctive conjunctions *either/or* that makes Machiavelli's writing particularly forceful and straightforward ("All states [...] are either republics or principalities; principalities are either hereditary [...] or they are new. The new ones are either completely new or they are like appendages [...]", etc.). Between the two alternatives (a third option is not taken into consideration), Machiavelli dissects the one relevant to his current discourse until each matter has been thoroughly investigated.

The main purpose of the treatise is to identify the best type among the possible principalities (hereditary, new, mixed, civil, and ecclesiastic) that may suit the Florentine political situation in the immediate present, as well as the ways of acquiring and maintaining it. Machiavelli intentionally excludes republics, which he asserts he has treated at length elsewhere, probably referring to a previous work subsequently merged with the *Discorsi*. After discussing the hereditary principalities like the long-established rule of the Este family, whose preservation is guaranteed by the continuity of their ancient customs, Machiavelli focuses on the instance of a prince adding new territories to his dominion (mixed principality). The negative experience of King Louis XII serves as an admonition on how not to act: after occupying the Duchy of Milan twice, wrong political decisions made him lose it on both occasions

(in 1500 and 1512). With regard to the ecclesiastical principalities, Machiavelli cannot hide his bewilderment, as they appear to be governed by principles that surpass human comprehension: they have states that they do not defend, subjects whom they do not rule. But if investigating the spiritual power of the Church can be deemed presumptuous, an explanation for its temporal authority is to be found in the suppression of the aristocratic factions opposing the pope in Rome. The much-debated concept of “civil principality” is introduced by Machiavelli to define a monarchic type of government formally maintaining republican institutions (Bausi 2005). Such a political constitution seems to fit the peculiar case of Florence where the Medici, having ruled *de facto* from 1434 to 1494, came again to power in 1512 after a short republican parenthesis. If this is the case, there are crucial matters on which Machiavelli needs to advise the new Florentine prince with urgency. Where should he find support? How should he maintain power? What public image should he project? In order to be as persuasive as possible, he examines these questions in each and every aspect. Between the two different “humors,” populace and nobility, that are found in any body politic, it is easier for the prince to keep the former under control rather than the latter. Whereas commoners are governed by the sole need not to be oppressed, nobles are ultimately driven by the ambition to prevail. Thus, entrusting magistracies to them is particularly dangerous as the prince’s authority would entirely depend on their loyalty toward him.

By looking at the recent and exemplary rise of Cesare Borgia, it is possible to understand how newly acquired power can only be maintained by one’s own troops and skills. Machiavelli uses the word *virtù* in its original Latin meaning to encompass the qualities of military strength (unavoidably connected to the use of a homegrown militia), boldness, and shrewdness that a prince needs to possess. However, another decisive element is necessary for him to succeed: he must be given an opportunity (*occasione*) by fortune. “Opportunity” is understood by Machiavelli as a critical political situation that enables the prince to display his *virtù* and establish a new

state for the benefit of his people. A homegrown militia contributes remarkably to political cohesion since it encourages citizens’ attachment to institutions and strengthens the relationship between a prince and his subjects. On the other hand, the employment of mercenary and auxiliary troops is condemned as the principal reason why modern Italian states are unable to prevent the invasion of foreign armies. These ideas are conveyed in a much more passionate tone at the end of the treatise, where Machiavelli urges Lorenzo de’ Medici to provide evidence of his *virtù* by seizing the opportunity offered by the present circumstances and liberate Italy from the invaders.

Chapters xv–xix contain a shocking survey of the qualities that a prince should possess or pretend to possess, in contrast with the ideal of the good prince inherited from the medieval tradition of the *specula principis* (“mirrors for princes”) as well as from humanist treatises offering instructions about how to rule. Machiavelli here rejects the moralistic description of unreal republics and principalities, asserting what was to become the foundation of modern politics: the necessity to search after “the effectual truth of the matter.” A realistic analysis of current events shows that, by following behaviors that are commonly regarded as morally praiseworthy (loyalty, liberality, piety), a prince can lead his state into ruin rather than safety, whereas by adopting measures typically considered blameworthy (treachery, malice, cruelty), he can maintain and consolidate his power. It is better in fact for him to be feared rather than loved because men, who are believed to be inherently bad, will not disrespect him as long as the threat of being punished never deserts them. However, a prince must abstain from offensive behavior that may make him too intolerable and hated. At the same time, he need not keep his promises if these are detrimental to his achievements. Since politics requires the use of certain animal-like skills to repel and deceive one’s enemies, Machiavelli counsels the prince to act as both a strong lion and, above all, a cunning fox. For when circumstances require actions contrary to mercy as well as trust, humanity, and religion, a prince should nevertheless be shrewd enough to show himself merciful, trustworthy, humane, and

pious. This goal can be achieved effortlessly because people readily allow themselves to be deceived.

The role fortune plays in men's actions is analyzed in chapter xxv. Machiavelli's first considerations of fortune are found in the letter *Ghiribizzi al Soderino* (1506) where he manifests his astonishment about Julius II's victory over the lord of Perugia, Gian Paolo Baglioni. This episode makes him reflect on the impossibility of establishing fixed rules about political behavior since it appears that the same (military) ends may be achieved by using different means (by being cruel or kind, armed or unarmed, whether through the construction of fortresses or not). Machiavelli asserts that it was only by chance that the unprotected pope could enter the city successfully without finding any opposition. His reasoning is based on the assumption that men are shortsighted, unable to understand constantly mutable circumstances and to change their nature accordingly. In such pessimistic vision, it is not possible for anyone to control the fickleness of fortune. Thus a ruler's success is only fortuitous, as it depends on the perfect match between his character and the times in which he lives (Brown 2010). Similar considerations are contained in the (likely contemporary) poem *Di fortuna*, addressed to the same Giovan Battista Soderini (Machiavelli 2001–: III.2). According to a common image in Renaissance art and literature, fortune is personified as a two-faced, cruel, and violent goddess, who inflicts harsh blows upon men, unless an extraordinary *virtù* is able to vanquish her. In her palace, she holds as many turning wheels (symbolizing her constant state of change) as there are different ways by which men may attain their ends. The only possibility for men to control fortune and be successful would be to leap from wheel to wheel, if only they were able to adapt their nature to a way of conduct different from their own. Through an effective simile, fortune is figured as a rapid and swollen torrent that upsets human affairs in its course.

All these elements of both the letter and the poem are adjusted to the political purposes of *Il principe*, where contradictions are nonetheless far from being solved. At first, asserting that human

actions depend partly on fortune and partly on the *virtù*, Machiavelli again compares fortune to a flooding river that washes everything away. Unable to oppose its overcoming force, men can only build dikes and dams in advance to limit the damage. A different metaphor though is provided at the end of the chapter where Machiavelli depicts fortune as a fickle and whimsical woman whom only impetuous and bold young men are able to subjugate.

The opposition between *virtù* and fortune raises questions on the limits of human action in controlling the unpredictable course of events to such an extent that one may even consider the figure of the prince utopian. But in Machiavelli's eyes, the formation of an Italian state able to resist foreign invasions was still possible; unfortunately, there was no prince whose *virtù* matched the critical situation of those times.

Discorsi sopra la prima deca di Tito Livio

In the case of the *Discorsi* too, the date of composition is a matter of scholarly debate. It is probable that Machiavelli used and revised material he had previously written on the same subject, including the work on the republics mentioned in the second chapter of *Il principe*. However, according to Vivanti the likelihood that the text of the *Discorsi*, as we know it, was drafted in the years 1517–1518 is very strong (Machiavelli 1997–2005: I). And in this form, it must also have been circulating among the friends of the Rucellai gardens before the posthumous publication by both Blado and Giunti in 1531. The different length of the three books into which it is divided (60, 33, and 49 chapters, respectively), the lack of a clear organization of subjects, and the presence of inaccuracies and mistakes suggest that Machiavelli did not revise the whole work with a view to publishing it. Roughly, the first book deals with Rome's internal politics that guaranteed its prosperity for so many centuries; in the second the city's expansionism is examined through the discussion of its military organization; the third book focuses on the glorious undertakings of Roman heroes but also includes other political issues such as the conspiracies that are treated at great length in the sixth chapter.

The *Discorsi* has long been considered Machiavelli's expression of republican ideals in contrast with the absolutist theories of *Il principe*, but such an interpretation would be limited and only partially true. The more relaxed style of the *Discorsi* enables him to address old and new issues extensively. Republics and principalities are only two of the forms of government subject to instability and mutability. From the classical tradition (Plato, Aristotle, and especially Polybius), Machiavelli draws the cyclical theory of political evolution (*anacyclosis*) according to which benign forms of government (monarchy, aristocracy, and popular government) easily degenerate into their corrupt counterparts (tyranny, oligarchy, and anarchy) (*Discourses* I 2). In order to rule well, the imitation of excellent examples among the ancients, which pursued in different fields (sculpture, law, and medicine), needs to be adopted in politics too. By postulating the fixity of human nature, Machiavelli argues that it is easy for those who carefully compare the present to past events to predict the course of history and find political remedies. Despite the risk of idealizing ancient models without considering their negative aspects, a laudatory approach cannot, however, be blamed if one lives in times in which any *virtù* is extinguished. The Roman republic is regarded as a positive example in several respects: political, military, and religious. The internal conflicts between the senatorial nobility and the plebs were not detrimental to the state (as was the strife between the *ottimati* and the populace in Florence). Indeed, they introduced new orders like the institution of the tribunes of the people which, by protecting the poor from the abuses of the wealthy, regulated civil life and ensured a certain degree of liberty (Najemy 2010). In Machiavelli's view, commoners should be allowed to participate in government because they prove not to be wrong if they are asked to evaluate specific situations and make decisions. He praises the moderation and discernment shown by the Roman plebeians in appointing four tribunes among the nobles because of their competence rather than among themselves (*Discorsi*, I 47). In comparison to the military organization of the Romans, the weakness of modern states depending

on the lack of strong armies, employment of mercenary and auxiliary troops, erroneous tactics, and overestimation of cavalry, artillery, and fortresses is roundly condemned, not without irony, by Machiavelli. In particular, the scant consideration given to infantry units by the Italian princes is regarded as one of the chief causes for their surrendering to foreign domination. Moreover, Machiavelli blames the replacement of regular forces by captains of fortune who have turned to the less onerous cavalry service in the attempt to enhance their reputation as much as possible.

Religion is another fundamental element in any republic or principality because reverence for the gods strengthens the bond between people and state as the Roman example teaches: it was during the reign of Numa Pompilius that Rome consolidated its power. However, in the case of the Christian religion, the corruption of the Church represents a negative model for people and is responsible for their moral and political ruin. Christianity has introduced a way of living that, unlike the pagan religion of the ancient Romans, makes people effeminate and incapable of defending their freedom. Machiavelli criticizes the alleged benefit religion brings to humankind by banning any use of arms and attacks those who have developed such an interpretation of the Holy Scriptures according to Christian principles. In a passage of the *Discorsi*, he observes that even Moses was able to establish new laws and institutions only by resorting to force (III 30). As far as the political body of the Church is concerned, Machiavelli's judgment is also negative: it was not powerful enough to rule Italy on its own, but it supported foreign allies to prevent any of the rival Italian states from taking possession of the country.

***Mandragola* and Other Plays**

The political principles expressed in *Il principe* have always seemed to scholars to find application in the micro-context of the *Mandragola*. The play is traditionally dated to 1517–1518 as suggested by the reference in the third act to the fear of a Turkish invasion, which was particularly widespread in many Italian cities in 1518. Nonetheless, such fear could have been an occasion for laughter

even later. The only extant manuscript of the comedy (Firenze, Biblioteca Medicea Laurenziana, Redi, 129) is dated 1519; thus it could have been written within the period 25 March 1519–24 March 1520 according to the Florentine calendar (Inglese 2006b). It is likely that the first performance took place in Florence shortly thereafter, followed by a second one in Rome for Pope Leo X as we may infer from the reference in Giovanni Battista Della Palla's letter to Machiavelli of 26 April 1520. More recently the case has been made for an earlier date, however not prior to 1515 (Black 2013). The earliest editions (the first published in Florence, without indication of printer or date, the second in Venice, by Alessandro Bindoni in 1522) were titled *Comedia di Callimaco e Lucrezia*, whereas, in Machiavelli's correspondence, the comedy is referred to by the name of the cuckold *Nicia*. The title *Mandragola* only appeared in the third edition printed by Francesco Minizio Calvo in Rome in 1524. In this way, attention was shifted to the device used in the plot by the parasite Ligurio to help his young master Callimaco satisfy his desire for Lucrezia, the beautiful young wife of the foolish Messer Nicia (Aquilecchia 1971). Like other Renaissance playwrights, Machiavelli draws on Boccaccio's *Decameron* for the plot of the play: in particular, on two stories of adultery, one featuring Lodovico, Madonna Beatrice, and Egano de' Galli as its main characters (*Dec.*, VII 7) and the other Ricciardo Minutolo, Catella, and Filippello Sighinolfo (*Dec.*, III 6). Although the influence of Aristophanes on the play was maintained in the past (Raimondi 1972), there has recently been unanimous agreement on its derivation from the Terentian model (Stoppelli 2005). However, despite some divergences in the identification of the characters, a few scholars have defended an allegorical and political interpretation of the comedy (Sumberg 1961; Bausi 2005). According to the most prevalent view, the Duke of Urbino, Lorenzo de' Medici, is recognizable to a Florentine audience in the guise of Callimaco; Lucrezia would be an allegory of the Florentine Republic, while through the negative portrait of Nicia, unable to satisfy his young wife's needs, Machiavelli could be referring either

to Pier Soderini, who yielded up the city to the Medici, or to the old Florentine oligarchy hostile to the populace. Continuing the allegory, friar Timoteo might represent either Pope Leo X or the Cardinal Giulio de' Medici, who helped Lorenzo in his political career, and it would also be possible to identify Machiavelli himself as the cunning servant Ligurio. His help to Callimaco would mirror the assistance that the author of *Il principe* thought of offering to Lorenzo. Be that as it may, there is no doubt that the grotesque world of the play in which all the characters are moved by deceit and are intent on obtaining their personal goals shows connections with the unscrupulous laws illustrated in the political treatise (Fleischer 1966).

There is some limited evidence that in addition to the *Mandragola* and the later *Clizia* (1525), in which the routine of an ordinary family is temporarily upset by the infatuation of the elderly Nicomaco (clearly a play on the author's full name) for a young girl, Machiavelli wrote two other plays. According to both his grandson Giuliano de' Ricci and the writer Anton Francesco Grazzini, one was an imitation of Plautus' *Aulularia*, entitled *La Sporta* and subsequently plagiarized by Giambattista Gelli, whereas the other play, the *Maschere*, was probably derived from Aristophanes' *Clouds*, although the content, date of composition, and form (whether a comedy or a satire) have not been established (Davico 2001). Machiavelli's interest in theater is also proved by his activity as a copyist and translator. Apart from the early transcription of Terence's *Eunuch*, he copied the *Commedia in versi* (perhaps written in 1516) of his friend Lorenzo Strozzi, which from its first edition in 1769 until 1892 (when its correct authorship was demonstrated) was published under Machiavelli's name. Nonetheless, the role Machiavelli played in this work is not completely clear, and the question regarding his influence remains unresolved (Cutinelli-Rèndina 2005). Two extant versions of Machiavelli's translation (in prose) of Terence's *Andria* have also reached us (Martelli 1968): the rough draft, whose traditional date of composition 1517–1518, has been recently questioned (Stoppelli 2005) and the final version (1520).

L'asino and Belfagor arcidiavolo

Scholars recognize political and satirical intents in the other two literary works by Machiavelli. In the autobiographical poem *L'asino*, inspired by Apuleius' *The Golden Ass* (c. 1517), which was left unfinished at the end of the eighth chapter, the author parodying Dante in hell imagines finding himself in a dreadful forest and luckily meeting a beautiful herdsman who takes him to the palace of her mistress, the sorceress Circe. There she tells him that he will have to turn into an ass and wander through the world in that guise before his misfortunes may come to an end. After a night of love with her, he is taken to see the beasts in her charge and exhorted to guess who they were in their previous human life. It is commonly believed that Machiavelli's intention was to offer a satirical portrait of his contemporaries. Several hypotheses have been advanced as far as the identity of the beasts is concerned: either men of letters, clergymen, or politicians. Likewise, there is no unanimous interpretation regarding the single animals of the poem (cat, fox, dog, etc.): it has been suggested that the ass and the deer could be identified, respectively, as Luigi Guicciardini and Piero Soderini, whereas the pig, who asserts the superiority of the animal condition, would be a mask for either Francesco Vettori or another friend of Machiavelli, Filippo Casavecchia (Bausi 2005). Because of such a comic dimension, *L'asino* has been regarded in the past as an expression of Bakhtin's grotesque realism (Anselmi and Fazio 1984). This particular approach emphasizes the connection between the poem and the political works on the basis of the animal instincts rooted in any human behavior (suffice it to think of the metaphors of the lion and the fox in *Il principe*). In the fifth chapter dedicated to the main character's reflections on the ruin of states, Machiavelli also hints at political matters that are more extensively developed in the *Discorsi* such as the negative role of people's ambition in the government and the necessity of good laws and orders.

The other literary work regarded by scholars to be relevant to Machiavelli's political discourse is the short story *Favola*, commonly known as *Belfagor arcidiavolo*. The traditional date of its composition (1519–1520) has been recently

postponed to the last years of the author's life (Stoppelli 2007). The devil Belfagor is sent to earth, where he gets married to prove whether women are as terrible as described by their partners arriving in hell, or not. However, after experiencing life among dishonest, greedy, and sly human beings, he prefers to return to the better-ruled kingdom of Pluto. Several topoi, which have their sources in the medieval tradition of *exempla* and oriental short stories, are present in this story: the anti-uxorial and misogyny theme, the character of the devil who gets married and makes an agreement with the peasant Gianmatteo, the anticlerical satire, and the representation of a topsy-turvy world. Echoes of Dante and Boccaccio are also found in the *Favola* belonging to the Florentine tradition of individual short stories (*spicciolate*) such as the anonymous *Grasso legnaiuolo* and *Bianco Alfani* (Chirumbolo 2003; Grazzini 1990). Machiavelli's assumption regarding the evil nature of people is paradoxically experienced by a devil; on the other hand, Gianmatteo's shrewdness emerges as a positive example of *virtù* since it enables him to adapt to unexpected circumstances and successfully escape from the dreadful situation in which he finds himself trapped.

Dell'arte della guerra

Military issues had been treated by Machiavelli in *Il principe* and the *Discorsi* but also in other minor writings. Between 1519 and 1520, he wrote a specific treatise on this subject, *Dell'arte della guerra*, which underwent a long revision before being published by Giunti in August 1521. Dedicated to Lorenzo Strozzi, one of the attendants at the meetings in the *Orti Oricellari* on close terms with the Medici, the treatise consisting of seven books has the form of a humanist dialogue, set in the pleasant frame of the gardens themselves in 1516. The main interlocutor, the condottiero Fabrizio Colonna, represented in his old age, discusses technical matters with the host Cosimo Rucellai and the other guests, Luigi Alamanni, Zanobi Buondelmonti, and Battista Della Palla. Ignoring the recent works on the art of war by Roberto Valturio (*De re militari* 1472 in Latin prose) and Antonio Cornazzano (*De re militari*

1494, reprinted in 1520, in Italian tercets), Machiavelli mainly drew on classical sources (Livy, Frontinus, and Vegetius) for the examination of different aspects of warfare: the recruitment and training of the soldiers as well as their equipment, the formation and disposition of the army, and the use of fortresses. The negative behavior of contemporary armies is strongly criticized through constant comparison with the proper way of fighting shown by the Romans. Only by imitating the ancient model would the Italian leaders be able to oppose the foreign invasions. Some key points of Machiavelli's thought are treated in more depth: the condemnation of mercenary troops, the preference accorded to infantry over cavalry, the obstinate distrust of modern artillery, and the leader's skills in encouraging his soldiers and instructing them through discipline and exemplary punishments. Apart from the analysis of technical aspects, the treatise confirms the bond between the art of war and politics as well as the subordination of military to civil power (Sasso 1993: i).

Istorie fiorentine

Like *Il principe* and the *Discorsi*, the *Istorie* too was published posthumously in 1532. Writing the official history of Florence was an arduous task for Machiavelli, since he had to deal with events occurring during the controversial rule of the Medici as a continuation of the humanist histories compiled by Leonardo Bruni and Poggio Bracciolini. However, in the preface, Machiavelli criticizes the two historians for having disregarded the civil conflicts that afflicted Florence in the past. Whether those events were too insignificant or offensive toward certain families to be related, they should nonetheless have been included in the narration as they were fundamental to the historical analysis. Accordingly, half of the eight books comprising the *Istorie* were dedicated to filling that gap after an opening excursus on the Italian and European history following the fall of the Roman empire. The second part (books v-viii) contains a more detailed analysis of Florentine history in the years that intervened between Cosimo de' Medici's rise to power in 1434 and the death of Lorenzo the Magnificent in 1492. Focusing on specific sources (Biondo,

Villani, Capponi, Cavalcanti, Giovanni di Carlo) for the composition of the single books (Hatfield 1972; Cabrini 1985, 1990; Bausi 2005), Machiavelli was not much concerned with factual accuracy. He was rather interested in investigating the social and political factors that might be useful to provide an insightful interpretation of the historical events. His narration is conditioned by a negative approach to the recent history of Florence as well as of the other Italian powers concerning non-heroic characters and deeds, as a consequence of constant comparison with Rome's illustrious past (Matucci 1991; Cabrini 1998). Ironic effects derive from such a juxtaposition that emphasizes the shortcomings and failures of modern states (Di Maria 1992; Quint 2003).

Machiavelli's views are more openly expressed in the introductions prefixed to the books where he develops the political themes underlying the events subsequently reported. Other comments are spread across the narration, but these either consist of isolated sentences or are concealed under the direct or indirect speeches of the historical characters. In regard to foreign policy and military matters, Machiavelli observes that modern states are unable to preserve newly conquered territories and strengthen their power because they do not pursue the ancient practice of founding colonies (ii 1). Contemporary conflicts in which bloodshed and destruction are mostly avoided should be better described as skirmishes rather than wars (v 1). Whereas well-ordered republics of the past used to fill the treasury with war booty and granted awards to the populace by paying off their debts and organizing public entertainments, contemporary rulers empty the treasury either to equip the mercenary soldiers or to remunerate them for their service so that onerous military expenses are imposed on the people (vi 1).

Particular attention is paid to the comparison between the internal conflicts of Rome and Florence that resulted in completely different scenarios. In Rome, the disunity of nobility and plebs had positive consequences on political, military, and social life, whereas in Florence civil strife only caused the weakening of magistracies and martial virtues (iii 1). In opposition to ancient republics that made use of good laws and

institutions, the lack of upright governments makes modern states pass from a condition of servitude (when they are ruled by the rich) to one of license (when commoners are in power) and vice versa in a vicious circle. Indeed laws that might mitigate the social conflicts between the two groups are seldom established. Internal divisions can be advantageous for republics only if these are not at the mercy of factions that arise when individuals place their personal ambition over the public good (vii 1). By asserting that Florence's history has always been infected by such a plague, Machiavelli avoids directing specific criticisms against the Medici's rule, which can be regarded as the final part of a long-standing political degeneration.

Reception

There is little evidence about how Machiavelli's political and historical ideas were received initially. The above-mentioned *De regnandi peritia* (1523) by Agostino Nifo, far from the political realism of *Il principe*, obliterates any outrageous assertion and, according to tradition, offers an Aristotelian analysis of the forms of government extolling the figure of the good Christian prince. In his *Considerazioni intorno ai "Discorsi" del Machiavelli* (1529), Francesco Guicciardini disagrees with Machiavelli's principle of imitating the Roman model in modern times, his preference for a democratic government over an oligarchic one, and his peremptory way of arguing and drawing conclusions.

In the decades immediately following his death, his major works were translated (into Latin and various vernacular languages) and spread across Europe, attracting few supporters and many more detractors. It was in particular the reading of *Il principe* as a work instigating a prince to violence, deception, and disrespect of Christian values that contributed to Machiavelli's reputation as the devil. In his *Apologia ad Carolum Quintum* (1539), the English Cardinal Reginald Pole asserted that the political treatise was *Satanae digito scriptum* ("written by Satan's finger"). The Portuguese bishop Jeronimo Osorio (*De nobilitate christiana*, 1542) and the Dominican friar Ambrogio Catarino Politi (*De libris a*

christiano detestandis et a christianismo penitus eliminandis, 1552) condemned Machiavelli for his vilification of the church. Unsurprisingly, in 1559 Machiavelli's works were included in the papal *Index of Forbidden Books*. In the climate of repression fostered by the Counter-Reformation, new attacks were made not only by Jesuits (Antonio Possevino and Pedro de Ribadeneyra) but also by their opponents. In his *Discours contre Nicolas Machiavel* (1576), the Huguenot Innocent Gentillet argued that the St. Bartholomew's Day massacre of French Protestants was caused by the diffusion of Machiavellian ideas at the court of Catherine de' Medici. Such hostility also affected thinkers like the French philosopher Jean Bodin, who in his *Methodus ad facilem historiarum cognitionem* (1566) had shown appreciation for Machiavelli's new political ideas and in his subsequent *Livres de la République* (1576) rejected the impiety of his doctrine. By the end of the sixteenth century, Machiavelli had become a byword for the use of unscrupulous means in politics (Machiavellianism) regardless of whether his works were read or not. Thus, Possevino appears to condemn Machiavelli in his *Iudicium [...] de Nicolai Machiavelli quibusdam scriptis* (1592), borrowing his attack from Gentillet. At the same time, Machiavelli's ideas served as a stimulus to political thinking, and an effort was made to domesticate his thought and bring it in line with Aristotelian tenets, even while translating it, for instance, in France (Fournel 2019).

Despite this widespread anti-Machiavellianism, the new concept of politics as a science separated from morality, whose ultimate goal was the pursuit of the common good through a realistic analysis of the present circumstances, had penetrated the consciousness of sixteenth-century philosophers. However, they found ways to either disguise or conciliate this influence (not without contradictions) with their religious belief. In his *Politiorum libri sex* (1589), the Flemish scholar Justus Lipsius concealed his adherence to Machiavelli's ideas by drawing upon quotations and maxims from classical sources, in particular the Latin historian Tacitus (such a phenomenon, which in subsequent years was to become

common, is referred to as Tacitism). On the other hand, Giovanni Botero's *Della Ragion di stato* (1589) attempted to conciliate reason of state – understood as the knowledge of the means for the substantial preservation of the state – with Christian religion by making faith an inalienable virtue of the prince.

At the beginning of the following century, a new product of anti-Machiavellianism was the *Atheismus triumphatus* (written in 1605 but published later in 1631) by Tommaso Campanella, who defined Machiavelli as a “heretic” and “pseudo-politician” alongside Calvin. A different interpretation was advanced by the satirist Traiano Boccalini in his work *Ragguagli di Parnaso* (1612–13), according to which the covert purpose of *Il principe* was to unveil the evil side of tyranny.

In Elizabethan England, where the “Machiavel” had captured the popular imagination by entering the stage as the character of the utterly amoral and cunning villain through the plays of Marlowe and Shakespeare, Machiavelli's original contribution to modern political thought was first acknowledged by Walter Raleigh and Francis Bacon. In the years of the English Revolution (1640–1660), the reading of the *Discorsi* instigated James Harrington's interpretation of Machiavelli as a defender of republicanism, which was very influential afterward and would also provide the cultural basis for American independence from Britain a century later. In his utopian work *Oceana* (1656), Harrington encouraged Oliver Cromwell to act as the Machiavellian legislator in using the prudence of the ancient Romans to provide the country with new political orders and laws. Such a republican dimension of Machiavelli's thought is also found in Dutch works, including Baruch Spinoza's *Tractatus Theologico-Politicus* (1670) in which it is suggested that even *Il principe* can be read as “an implicit defense of republicanism”, given that it reveals the prince's wickedness for the benefit of the multitude's freedom (Kahn 2010). This interpretation, already advanced by Boccalini, prevailed in the age of the Enlightenment underpinning Diderot's entry *Machiavelisme* in the *Encyclopédie* as well as Rousseau's view of

Machiavelli that “under the pretence of instructing kings, he has taught important lessons to the people” (*Du contrat social*, 1765) and the preface to the Florentine edition of all his works by Gaetano Cambiagi (1782). It was nevertheless possible to read attacks against the evil doctrines exposed in *Il principe*, for instance, in the essay *Anti-Machiavel* (1740) written by Frederick II of Prussia with the collaboration of Voltaire.

Following the French Revolution and the Napoleonic Wars, a new historical perspective to the study of Machiavelli's works was attempted by the German philosophers during the rise of Romantic nationalism. In his essay on the German constitution (*Die Verfassung Deutschlands* written between 1798 and 1802 but published posthumously in 1893), Hegel compared the political fragmentation of Germany to that of Renaissance Italy, advocating Machiavelli's realism and sharing his yearning for national unification. Likewise, Fichte emphasized the unity of *Il principe* and the *Discorsi* and urged the need to both unify the country under a powerful ruler and organize a warlike state based on the law and participation of the people (*Über Machiavelli als Schriftsteller*, 1807).

In Italy, it was above all through the pages of Francesco De Sanctis' *Storia della letteratura italiana* (Napoli 1870–1871) that Machiavelli was established as the founder of modernity and the precursor of Italy's Risorgimento. At the beginning of the following century, apart from shallow interpretations aiming at defending particular ideologies (as in the case of Fascism), original contributions to the understanding of Machiavelli's thought were made by the Italian thinkers Benedetto Croce and Antonio Gramsci, as well as by the German historian Friedrich Meinecke. Within the framework of his philosophy of the Spirit, Croce regarded Machiavelli as a philosopher of politics who did not disparage ethics while asserting the autonomy of politics but acknowledged the independence of both fields without feeling the urge to make a connection between them. Gramsci's Marxist view, focusing on *Il principe*, transferred the abstraction of “new prince” to the modern historical context, identifying him with the revolutionary party whose mission was to implement a new intellectual and

moral reform within civil society. A new modern reconsideration of Machiavellianism and reason of state was advanced by Meinecke in his *Idee der Staatsräson in der neueren Geschichte* (1924). In the aftermath of World War I, he questioned the pursuit of absolute power shorn of any ethical dimension, resorting to Machiavelli's pagan *virtù* as a solution to the long-standing philosophical conundrum. Influenced by both Croce's idealism and Meinecke's teaching, Federico Chabod offered a more complex profile of Machiavelli: he explained the contradictions of his works and the unsolved monarchy-republic question as a reflection of the political crisis raging in Italy between the fifteenth and sixteenth centuries.

From the second half of the twentieth century, with the exception of isolated anachronistic anti-Machiavellian views such as Leo Strauss' *Thoughts on Machiavelli* (1953), a number of specific works (Baron 1961; Pocock 1975; Skinner 1978) have reinstated Machiavelli in the current political debate, often marginalizing those controversial elements in his thought that seem to invalidate the substantial republicanism (Barthas 2010). However, a more thorough understanding of Machiavelli's work has been made possible by the insights of Felix Gilbert, Nicolai Rubinstein, and Carlo Dionisotti into the historical and cultural context of Renaissance Florence. More recent contributions provide new readings that challenge such an entrenched approach. In her *Machiavelli's Ethics* (2009), Erica Benner aims at presenting Machiavelli as a moral philosopher in line with the interpretation offered by readers like Bacon and Rousseau. Emphasizing the influence of the ancient Greek authors on Machiavelli's thought, she argues that the ironic expression of his political ideas in *Il principe* inspired by the Socratic tradition testifies to the republicanism based on the principle of justice evident in his other works (Black 2012). John McCormick's *Machiavellian Democracy* (2011) points to the ways in which Machiavelli envisages popular participation in politics as a solution to flaws in contemporary democracies. The risk of a government entrusted to an elite group can be warded off only through suitable institutions conferring political power on the common people.

Machine in Renaissance Sciences

Alvin Snider

Department of English, University of Iowa, Iowa City, IA, USA

Abstract

This entry on Renaissance culture of the machine proposes a definition of the subject that accounts for both its continuity and

variability from the late sixteenth century onward. In philosophical, scientific, and literary texts we see the term *machine* employed in ways that stretch its frame of reference to extend from individual organisms to the entire universe. Machines occupy a space that falls between artisanal knowledge and the outer reaches of mathematical physics, a liminal position that merges practice with theory. Similarly, the mechanical arts become contiguous with principles of an emergent mechanist philosophy in a relationship of mutual sustenance. René Descartes exemplifies the logic of interaction among branches of knowledge when he equates the laws of mechanics with nature itself and suggests that we regard bodies as machines crafted by the hand of God. Engineering, art, and philosophy all underwrite the burgeoning success of a type of book known as the theater of machines, beginning with the publication of Jacques Besson's *Theatrum instrumentorum et machinarum* (1578) and Agostino Ramelli's *Le diverse et artificiose machine* (1588). Machines (especially fountains, clocks, and automatons) become integral to the culture of the Renaissance because they supplied a blank slate on which various theories, mythologies, and commitments get inscribed. They appear across different forms of seventeenth-century writing, including verse, because they encode meanings that operate on multiple levels. Changes in the material and intellectual life of Europe brought about a steady ascent of the machine to the apex of power and visibility.

Introduction

In modern European languages, the word *machine* carries a wide range of meanings and connotations. Among its synonyms in English are apparatus, appliance, artifice, contraption, contrivance, device, engine, gadget, instrument, invention, and tool. One could easily enlarge that list. In Shakespeare, Hamlet subscribes himself in a letter to Ophelia as “Thine evermore, most dear lady,

whilst this machine is to him, Hamlet" (2.2.123–24), using the term, presumably, to refer to his own mortal body. With this odd expression, Hamlet might intend to parody conventions of love letters, or might have a darker purpose, to invoke a demystifying materialism that advances a view of human beings as bundles of reflexes, embodied machines. Hamlet's closing, his valediction, offers a roundabout way of saying "As long as I may live." Yet it harbors other implications just below the surface. To define a *machine* as "a device engineered to perform some kind of work by applying force" delimits the word's meaning, but perhaps too rigorously. Viewed from the perspective of the history of early technology, machines look like systems for the conversion of input into output for the performance of specific tasks. One historian of technology in the Renaissance puts it succinctly: "In practice the word *machine* seems to have been applied to any instrument interposing a certain number of moving parts between driving-force and acting-part" (Gille 629). Viewed *sub specie aeternitatis*, however, we could say that machines are structures, either simple or complex, that transfer or transform energy.

Four centuries after *Hamlet*, *machine* has enlarged to encompass information and computer technologies and now comprehends nanotechnology and systems assembled from biological components. Both brains and bodies in their constituent parts, such as living cells, seem to us machinelike in a way that early modern mechanical philosophy could only intuit. What Hamlet hints at, with his ironic phrase, reflects on a breakdown of boundaries between human and non-human realms that begins in the Renaissance and extends to the present. Descartes (1984–1985) offers a famous formulation of the idea in Part 5 of the *Discourse on the Method*, where he equates the laws of mechanics with the laws of nature and suggests that the body be regarded "comme une machine qui, ayant été faite des mains de Dieu, est incomparablement mieux ordonnée...qu'aucune de celles...inventées par les hommes" ("as a machine which, having been made by the hands of God, is incomparably better ordered than any machine that can be devised by

man") (Descartes 1:139). In other words, the body, subjected to dissection and other forms of analysis, shares much in common with automata, which Descartes treated as relatively simple specimens of the incomparably superior divine engineering we see in animal bodies.

If, in Hamlet's lexicon, the individual organism figures as an apparatus of sorts, at the opposite end of the spectrum the entire creation also would seem to exhibit mechanical properties. "La machine ronde" is a phrase used in the sonnets of Jean de La Ceppède (1550?–1622) to describe the Earth in relation to the rest of the universe (sonnet 29, "Jusqu'au Ciel voirement"). For the poet, the cross is an axle-tree that stretches to the heavens: "c'est dans le centre du monde/Que cet Arbre est planté, pour marque que son fruit/Est pour tous les bourgeois de la machine ronde" ("this Tree is planted clean/In the world's centre, showing that its fruit / Is for all commons of the round machine"). Read theologically, the tree/cross that sits at the world's center, offering up its fruit, represents an allegory of the crucifixion. We can also interpret the cross astronomically, as a spindle attached to a revolving globe on which "les bourgeois de la machine ronde" glimpse the cosmos and the mysteries of planetary motion. The unexpected appearance in this otherworldly setting of bourgeoisie, inhabitants of towns and cities, invokes conditions of manufacture that played a vital role in the development of technology. The mechanical arts form a bridge between mathematics and other branches of knowledge. To cite one famous example, improvements in ballistics associated with Niccolò Tartaglia (1506–57) and Galileo Galilei (1564–42) derive from a reappraisal of the Aristotelian theory of motion along with formulae used to calculate the paths of projectiles. Renaissance machines occupy a space that falls somewhere between two poles, with practical bodies of knowledge such as hydraulics and anatomy at one end and mathematical physics at the other. The term *machine* engrosses everything from Hamlet's body to the entire globe. As artisan-engineers acquire new social capital and associate their art with ancient mechanics and modern natural philosophy, machines cross a threshold between practice and theory. The *artes*

mechanicae, the mechanical crafts of design and production, henceforth will proceed under the tutelage of the *artes humanitatis* and vice versa.

Heritage and Rupture with the Tradition

The history of machines in the West begins, not surprisingly, with the Greeks and Romans. The philosopher Gerald Raunig, in a book that builds on Félix Guattari and Gilles Deleuze's view of the machine as a convergence of social, technical, and bodily components, reads the Latin term *machina* and Greek *machanê* philologically, underlining how in antiquity the words had applications both in the arts of peace and the science of war. Raunig, who hopes to undermine the binarism that makes the gap between human beings and machines unbridgeable, sees the word's dual meanings as mutually reinforcing: "On the one hand there was the military use as an apparatus for besieging, conquering or defending cities, in other words as a war machine, while on the other hand it was also used as a comprehensive term for the machinery of the ancient theater" – specifically, the *deus ex machina*, which lofted actors above the stage to create an illusion of airborne divine omnipotence. More generally, Raunig takes note of the distinctive logic behind the bundling together of technical innovation and warfare in the dual-purpose word (36–37). Gods suspended on ropes above a stage (and contrivances of plot in resolving dramatic tensions) fell out of favor, but they did not vanish altogether. Instead, they assumed new guises. Artifice now demanded the effort of cloaking theatrical illusion and deploying improved stage machinery to create realistic effects: "The cloud machines of the Italian baroque theater, for instance, had not only the function of transporting and illuminating deities, but also and especially of masking the technical apparatuses" (41). Machines, we could say, enter Western culture in the service of theatricality and illusion. "It seems," according to Bertrand Gille, "that machinery was first used in drama in 427 B.C., but it is impossible to decide whether the winch and pulley were employed first in the theater or in ships and ship-building" (Gille 630).

We cannot with any degree of certainty assign dates to the invention of many common machines, including water mills, treadmills, and presses, but we have ample evidence of their antiquity. Mills, for example, turn up in the ruins of Pompeii and ancient Ostia (Gille 639). The mechanical arts of the early modern period, despite the prestige and influence of classical precedents, set on a new course under the guidance of mathematics and philosophy.

Older historians of early modern science sometimes treated the mechanical philosophy as part of a revolution in thinking that broke with Aristotle and scholastic philosophy to point the way forward to the experimental science of the seventeenth century. In accounts adopting this narrative, the revival of Greek atomism in the late sixteenth century stays central to the history of science because those responsible for it "prepared the ground for the development of a true physical atomism, one that could and would explain the physical properties of bodies by means of the characteristics of the component particles... They served to create a climate of opinion in which the mechanical philosophy could develop along purely physical lines, relatively unhindered by the more metaphysical problems of atomism" (Boas 433). Mechanical philosophy, however, does not reduce to atomism nor does it necessarily repudiate Aristotelianism. It does invoke an explanatory principle that looks no further than motion, shape, and size to explain phenomena and takes machines as the soundest basis for modeling the material world. Daniel Garber prefers to make distinctions in sorting through the usual lists of "mechanists" and not lump together thinkers who have less in common than might appear at first blush. He distinguishes, for example, the mechanical philosophy from mechanics on the basis of their having different objects of study: "Natural philosophy, physics, treats *natural things*, things that have internal principles of motion and rest. Mechanics, on the other hand, treats *machines*, *artificial things*, things that *lack* nature, properly speaking" (Garber 21, 22). Garber offers a useful caveat in encouraging us to avoid applying "mechanist" indiscriminately, especially in the earlier part of

the seventeenth century. From the analyst's point of view, not every philosopher brought under the rubric of mechanist philosophy fits the bill when measured against a consistent standard. "Mechanical philosophers," with the exception of Descartes, Gassendi, and a few others, were no such thing. Despite Gerber's hesitation about *mechanical* as an actor's category (a term that sociologists of science use to describe historical viewpoints), we find it and related terms stamped all over the culture of the period. It continues to carry water in the history and philosophy of science because it suggests affinities, both inside and outside the discourse of natural philosophy, to which we have our attention called in writings by the actors themselves. Again, much depends on how we define key terms. Dennis Des Chene argues that "'machine,' like other concepts in its neighborhood – nature and art, the organic and the inert, animate and inanimate – is better thought of as a variable, or a zone of variations impinged on by others, than as an essence." Des Chene proposes that we distinguish among *mechanical philosophy*, "a more or less tight-knit bundle of methodological precepts, schemes of explanation, and ontological claims, associated with an ideology of knowledge and control through making," *machines*, and *mechanisms* (Des Chene 2005: 66, 68). All these terms, however, tend towards elasticity, with the last applying equally to living organisms. Brought into being by machines and encouraging their use in turn, we find a reductionism that transforms all matter and all life into a type of featureless substance. Mechanist philosophers regarded the nascent life sciences as an extension of physics and the body as a machine. The agenda they embraced held that living bodies have no properties to distinguish them from non-living bodies, apart from the consciousness Descartes considered the unique possession of human beings (Des Chene 2001: 2–3).

Innovative and Original Aspects

The Renaissance machine operated not only in the thin atmosphere of mechanist theory but also in a down-to-earth dimension of pumps, camshafts,

levers, winches, rollers, and weights. Key areas of technological development include the crank and connecting rod, gear trains, hydraulic power, and wind power. Descartes took a keen interest in the details of mechanical systems. In 1631 he traveled in the company of his friend and correspondent Étienne de Villebressieu, a medical doctor involved in land reclamation and water management projects, to Denmark to observe the operation of hydraulic machinery. In books such as Vittorio Zonca's *Teatro Nuovo di Machine et Edificii* (Padua 1607), Heinrich Zeising's *Theatrum machinarum* (Leipzig 1629), and Georg Andreas Böckler's *Theatrum machinarum novum* (Nuremberg 1673), machines enter the orbit of a late Renaissance genre called the "theater of machines," in which lines between experiment and spectacle blur in a sequence of technological performances. To spend time in rare-book collections studying the original engraved plates in such volumes (for example, the Dibner Library of the Smithsonian, in Washington, D.C.) is to enter an arena of aesthetic experience. These volumes in their original states provide examples of objects at once beautiful and useful. Some of the devices depicted in the plates are mills or military engines; some assist in the lifting or pulling of burdens; some approach the perennial problem of moving water. More industrial installations than "machines" in a strict sense, many employ intricate Rube-Goldberg designs that certainly do not look as if they would work (but some, reportedly, do). A. G. Keller quotes Zonca on the ingenuity of a spinning mill (Keller 36–39) and applies Zonca's tone of transported admiration to a fanciful depiction of an elaborate and enormous pump with an endless chain operated by a single hard-pressed laborer: "Zonca says of the silk spinner: 'Here are so many movements of wheels, shafts, pulleys and other sorts of timbers, that the eye is dazzled at thinking how human wits have been able to understand such a variety of things, so many contrary motions, moved by a single wheel.'" One end of the pump resembles a traditional irrigation system, using buckets to raise water from a pool below. Above, however, we see a laborer operating a treadwheel, which "turns the pinion, which

engages the spur-gear, which turns the second pinion, which turns the crown-wheel, which turns the big pinion (immediately below the fly-wheel), which turns the fourth pinion. All this, of course, has little function except to dazzle the onlooker with the inventor's ingenuity, and to provide space for an extra flywheel" (Keller 105). Ostensibly designed for the express purpose of lifting water, the pump serves more as a study of motion and counter-motion, of the abstract possibilities of linking wheels and gears in complex ensembles. The "unfortunate labourer," as Keller describes the operator, seems more machine than machinist, literally a cog in the wheel of ceaseless and possibly pointless production. The plate sets forth a set of instructions but also revels in the beauty of technological possibility and machine-age aesthetics.

Two well-known books, familiar from facsimiles and frequent reproduction, are Jacques Besson's *Theatrum instrumentorum et machinarum* (1578) and Agostino Ramelli's *Le diverse et artificiose machine* (1588). Besson, the earlier of the two author-engineers, dedicated a 1569 manuscript that featured his inventions to Charles IX, in which he aligned his work with a program of social improvement intended for the benefit of "geometers, mariners, merchants, artisans, and gentlemen, in brief for rich and poor, who wish to understand all that for the conservation, utility and maintenance of the commonweal" (Heller 107). The first edition appeared in 1571/1572, and a posthumous second edition in 1578, prepared for the press by François Berauld, with the evocative word "theater" asserted in its title. Translated into several European languages, the book went into multiple editions by the end of the century. Henry Heller, whose commentary I follow here, points out that Besson knew his way around the literature on mechanics, marrying theory and practice in a mixture that reveals his grounding in physics. His utilitarian goals, however, in no way precluded "a sense of playfulness and imagination" (Heller 107). With the publication in the vernacular of his *Theatre des instrvments mathematiques & mechaniques*, he secured a place for a genre very much in vogue for two centuries after 1570. Theaters of

machines, as two French scholars summarize the form, are "books printed in folio that contain an engraved frontispiece, a dedication to some illustrious person, and a forward that states the author's intentions, as well a summary of ideas found in the text." Following the front matter, we find "a series of full-page engravings of various instruments or machines accompanied by a brief description of their functions" (Dolza and Vérin; my translation). These treatises appeared throughout Europe but had a special currency in Italy, France, and Germany. Besson's book covers a varied assortment of contrivances, not only the usual mills, pumps, and presses but also a perpetual motion clock and a fire engine (possibly the first). Some of his machines draw on ancient models while others have modern sources. As Heller comments, "Besson's machines are a mixture of serious technical inventions and fantastical contraptions" (109), a generalization that holds for most books of this type. Besson serves Heller to illustrate the dynamism of the French economy at a time when intellectual curiosity found outlets in the areas of technology, manufacture, and science. His success attests to the central role played by technical concerns in French culture at large, including the economy. Another commentator finds in illustrations of hydraulic works and other inventions the source of later developments in science and philosophy: the work of the engravers profoundly influenced the young Galileo, Johannes Kepler (1571–1630), Descartes, and others whose education coincided with the publication of illustrated technical books such as Besson's (Edgerton 185–192). Printed books on mechanical subjects loom large since drawings of machines in the fifteenth and sixteenth centuries – most famously those of Leonardo da Vinci (1452–1519) – remained in manuscript and did not reach large audiences.

Remembered today for his fanciful revolving book-wheel (supposedly a precursor of information culture), Ramelli (1531–ca.1600) also designed military hardware, including lifting devices and weapons for hurling projectiles or breaking through defenses. Among his inventions for use by non-combatants were the usual mills and pumps, as well as excavators, fountains,

cofferdams, and so forth. The dual-language *Diverse et Artificiose Machine*, in Italian and French, seems geared to a broad and polite audience. Describing it as “a coffee-table book par excellence” (Edgerton 187) scarcely does justice to how the arts of illustration, papermaking, printing, and engraving combine in this work of art. The book’s almost 200 illustrations, which cast the facing commentary in the shade, make it an outstanding example of early modern book production, a technical triumph in its own right. A revolving bookcase seems only appropriate to the undertaking, given the bibliographic significance of the volume in which it appears. Ramelli presents his designs as more than just ingenious solutions to engineering problems but as objects of admiration, human inventions capable of initiating readers into the mysteries of the natural world. No contemporary, to the best of our knowledge, thought to build any of his projects. In his preface to the reader, he entreats “every noble mind to read and reread this work carefully, not stopping at the rough exterior of the writing but penetrating with subtle perception into the deepest and most hidden secrets which to his great astonishment will continually be set before him” (Gnudi translation, 55). What the book sets before our eyes, is the collaboration of nature, art, and technical ingenuity. Ramelli ushers us into a theater of wonders, and, unlike Zonca, who celebrates the state of the mechanical arts in his day, Ramelli prefers to speculate and predict. Pumps are of particular interest to him, and he improvises many variations on what might first appear as a conventional theme. His medium is more visual than verbal, but as Jonathan Sawday argues, the machines on display serve as readable texts as much as blueprints for production. Such books present riveting spectacles of the interaction of men and machines, displaying engineering as a theater of masterful and impressive effects (Sawday 108–109). Sawday’s primary interest in Renaissance machine books focuses on how mechanization transforms the logic of labor, how, for example, the printing press, the Renaissance machine par excellence, promotes a labor-saving method of intellectual endeavor, or how the *perpetuum mobile* might simulate God’s

creative work. Sawday quotes from a treatise on estate management, Cyprian Lucar’s *Lucarsole* (1590), which refers in one passage to the various machines it mentions as “strange engines and instruments, not only for private pleasure but also for sundrie purposes in the commonwealth,” suggesting that Renaissance technology aimed at goals beyond simple utility (Sawday 111). Behind the creation of these theaters, we find motives more often associated with art than technology: play, fantasy, and enjoyment. Viewers could expect to find beauty and pleasure in their experience of machines in spite of their daunting complexity. They appear on the page as “engines of the imagination,” in Sawday’s phrase, replete with symbolism and myth, designed to entertain as much as to save labor.

Sawday takes note of an issue discussed above, the maddening difficulty of working through a satisfactory definition of *machine*. To describe all machines as “force-transmitting devices”, as one historian of technology proposes, lands us squarely in a web of Newtonian physics (indeed, a newton is a unit that measures force). If the word *machine* resists simple explanation, *mechanics* underwent a parallel drift in meaning in the late Renaissance. “Traditionally, mechanics had dealt with the mathematical science of simple machines and the equilibrium of bodies. In the second half of the seventeenth century, however, mechanics became increasingly associated with the science of motion” (Meli 632). Once the province of early modern engineers, the field expanded to absorb portions of natural philosophy and attracted attention from a range of scholarly and scientific disciplines. Descartes’s philosophy, together with writings by Pierre Gassendi and Galileo, provides a tripodal stool on which mechanical philosophy rests. Philosophers sometimes equate the mechanical philosophy with atomism, but we cannot call every mechanist an atomist by strict definition. Descartes’s commitment to mechanism ran deep. His argument that particles of matter reduce to smaller particles of matter, however, seems rather weak tea in comparison with the bolder claims of atomic theory. Descartes “aimed at creating a new worldview where a mathematical description of nature, and especially motion, was joined to a

physical causal explanation. The key to this link was the microworld of corpuscles and subtle fluids responsible for physical phenomena” (Meli 654). Descartes explains various phenomena, from the motion of the blood to planetary motion, according to a mechanical model; physical nature, on his account, depends from top to bottom on the interaction of discrete particles in motion.

Dennis Des Chene proposes that we cleave the Cartesian mechanical philosophy in two, with one part committed to an ontology that reduces nature to various mechanical properties and the other that deploys mechanism as a mode of explanation. One can produce intelligible accounts of the natural world without assistance from a mechanistic ontology, and in the work of scientists such as Giovanni Alfonso Borelli and Charles Perrault we see the two roads diverging (Des Chene 2005). Descartes does not shy away from touting the power of his model across fields of inquiry, however, suggesting broad applicability. His techniques apply to “all the phenomena of nature,” and are “sufficient for application in ordinary life, since medicine and mechanics, and all the other arts which can be fully developed with the help of physics, are directed only towards items that can be perceived by the senses and are therefore to be counted among the phenomena of nature” (Descartes 1:289). In this passage, Descartes grapples with the problem of producing explanations of things not present to the senses, which would seem to entail putting all knowledge of the natural world within the domain of physics. Descartes and his contemporaries well understood that most physiological functions, including digestion and reproduction, depended very little or not at all on human will, and seem fascinated with autonomism, involuntary reactions where the body takes on a life of its own. The human body seemed to them a machine artfully contrived for the performance of complex functions, some of which operate independently of conscious control. Although no existing clock or automaton could compare to the wonderfully subtle operations of a limb, all bodies obeyed the same principles of figure, size, and motion. According to the Cartesian view,

living bodies have no properties and include no entity that would distinguish them from the non-living, apart from the consciousness uniquely enjoyed by human beings (Des Chene 2001). Recognizing the very real difficulty of reconciling the intangibility of thought and feeling with the hard materiality of everything else, they drove a wedge between the two.

Impact and Legacy

Machines (fountains, clocks, and automatons in particular) became integral to the culture of the Renaissance because they intermingled myth with science and technology. In 1577, the astronomer Tycho Brahe recruited the bronze founder Georg Labenwolf to construct a hydraulic system at his observatory, Uraniborg in Denmark. Incorporating various mythological and allegorical motifs, Labenwolf’s fountain of Hippocrene (the source of poetic inspiration) featured the figure of Aquarius (the water carrier), rotated and brought to life by jets of water (Christianson 308, 66–67). Astrological and mythological associations aside, the figure of a man pouring water from a jug helped direct visitors’ attention to the observatory’s sanitary facilities and the supply of running water piped throughout the building. It also linked the labor of the observatory – which deployed a large staff to operate a printing press and other machinery handy for the production and dissemination of astronomical data – to aesthetic and literary concerns. In Tycho’s centralized research facility, hygiene and managerial efficiency intersect with astronomical observation and plumbing with the hierarchies of knowledge production. Tycho’s commissioned fountain does double duty as an engine of industrial labor and as a work of art. Renaissance machines accommodate many meanings and provide a blank slate on which various theories, mythologies, and commitments get inscribed. Designing and fabricating machinery often meant producing complex hybrids of this type.

A late seventeenth-century book on clock-making includes a history, which covers hourglasses, sundials, and water watches, but finds

interest in “Horological Machines” at low ebb until “the last Age,” when “Clock-work was revived, or wholly invented anew in *Germany*, as is generally thought” (Derham 1696; 84, 91). Clocks had become fashionable in polite society no less than in artisanal and intellectual circles. These worlds interacted with each other with tangible results. The astronomer and mathematician Christiaan Huygens (1629–1695) constructed a pendulum clock in 1657, a device that exemplified mechanistic principles such as motion and acceleration and also achieved new levels of precision. (He also worked on fountains at Versailles.) To Galileo, horologists owe the discovery of isochronism in pendular oscillations, but in putting the theory to work for regulating clocks his successors discovered gaps that needed filling. Huygens’s construction of a watch operated by a balance spring contributed to chronometry by achieving the practical end of improving accuracy by a significant factor. It also represented a scientific coup, a prestigious prize for which he and other scientists vied for credit. The impurity of early modern scientific and literate culture, its hybridity, remains one of its notable features. Experts in the mechanical arts readily adopted the assumptions and procedures of mathematics, and mathematicians shored up their own discipline by utilizing various instruments, including “those adapted to astronomy, navigation, surveying, warfare, and other practical activities of this sort.” Jim Bennett follows up this observation by concluding that “rendering a new technique accessible through designing an instrument was part of what it meant to do mathematics in sixteenth- and seventeenth- century Europe” (Bennett 675). Machines presented practitioners of different arts and sciences both with cutting-edge tools and new means for demonstrating difficult theories.

Fountains and clocks appear across different forms of seventeenth-century writing, including religious verse, and articulate meanings that signify on multiple levels. “Will God pretend to make a watch, and leave out the spring?” the poet and preacher John Donne (1572–1631) asks in the *Devotions upon Emergent Occasions* (Donne 1959: 10). And in “A Funeral Elegy” he

likens the lifeless body of a young woman, before her resurrection, to “a sundered clock” (2010; lines 37–40). The editorial annotation of this last phrase notes that the use of clocks as poetic analogy had various precedents, and conjectures that Donne’s interest in clocks here and elsewhere could owe to his acquiring one. Readers could easily fall into the temptation of speculating on the design of the timepieces Donne had in mind. Is the spring-driven watch worn around the neck? Does it maintain isochronism (uniform intervals of time) by using a fusee (a conical pulley), invented in the sixteenth century, or some other kind of movement? Of the various types of escapement, which were available to a buyer in London? What parts got broken and how? Such unanswerable interrogations of a densely allusive text pull us outside the boundaries of the knowable and rather miss the point. Better to say that the appearance of clocks in Donne and his contemporaries supplies evidence that clock-making assumed an importance that went beyond their value as luxury items. Chronometers of different types played significant roles in the development of astronomy, navigation, measurement, and meteorology. Mechanical clocks, which had a history in western Europe dating from the late Middle Ages when they first appeared, exemplified technological success and experimentation across new fields of knowledge. As they became available to widening circles of people, they reached into their daily lives in ways nobody could anticipate. Donne gestures towards this in the two passages and shapes the meaning of machines for audiences well versed in theology and at least curious about natural philosophy. Above all, in their failing to function, as much as in their identification with human bodies, Donne’s timepieces invite us to consider the relation between machines and sentient life.

Jessica Riskin takes the title of her book *The Restless Clock* from Gottfried Wilhelm Leibniz, to whom she attributes an “active-mechanist view of natural machinery, and even of artificial machinery such as clocks” against the passive-mechanist model of Descartes and others. Leibniz describes clocks and people as ill at ease and perpetually in

motion: “As Leibniz saw it, the balance of a clock was in a constant state of agitated motion, and so too were human bodies. To be clocklike, to Leibniz, was to be responsive, agitated, and restless. In Leibniz’s alternative notion of machinery and mechanist science, however, machinelike meant forceful, restless, purposeful, sentient, perceptive. Mechanical meant lifelike, and vice versa: living beings were the most mechanical things in the universe” (Riskin). Riskin tells the story of the banishment of agency from explanations of nature, particularly in the life sciences, and of the contrary, active view. She attempts to recover a scientific principle that went into eclipse, overwhelmed by a victorious competitor, with the goal of charting how agency theories also contributed to the growth of knowledge. Positing the presence of active and restless clockwork naturalized the creation and demanded a counter-tradition of mechanist thought that could account for living beings in all their restless, purposeful, mechanical glory.

A mechanistic reductionism helped spur reconsideration of physiology and anatomy and the traffic between the mechanical philosophy and medicine flowed in a bidirectional channel deep into the eighteenth century and beyond. Emphases begin to shift by the time Marcello Malpighi (1628–94) came on the stage. Malpighi, a microscopic anatomist, conceived of the animal body not as a single system but an assemblage of minute machines:

The machines of our body. . . form the basis of medicine: for these are composed of threads, of filaments, of joists, of levers, of webs, of stagnant fluids, of tanks, of canals, of filters, of sieves, and other like machines. In examining these parts with the help of anatomy, philosophy, and mechanics, man is made the possessor of their structure and their function. (quoted in Smith 98)

Justin E. H. Smith, who quotes this passage, identifies a tectonic shift after Malpighi in Leibniz’s conception of animal bodies, no longer regarded as an agglomeration of little machines but instead as an *infinitude* of little machines. Leibniz draws a bright line between natural and artificial bodies, according to Smith. He explains the numberless machines that constitute the bodies of animals not by analogy to levers,

sieves, tanks, and so forth, in the manner of iatromechanics, but as animals themselves. In other words, Leibniz “takes his model for the composition and structure of animal bodies not from clocks or water pumps, but from more basic animal bodies” (Smith 99). A mechanist with a difference, Leibniz puts a new spin on his account of living bodies, without resorting to the old hydraulic and pneumatic explanations of animal motion.

However, Leibniz and others adjust the theory, clock and water-pump metaphors, and the entire horological-hydraulic-hydrostatic complex of ideas that underpin them do not pass from existence after the seventeenth century. Rather we see mechanical discourses retooled and repurposed. The doctrine of the “world machine,” a theory meant to impart a sense of dignity to the human confrontation with a vast and seemingly indifferent universe, gathers speed in the eighteenth century. Flexible and endlessly adaptable to new needs, including theology and literature, machinery and mechanics reside close to the heart of humanist culture and help shape the concepts of artifice and invention, which artists held dear (Wolfe 2004). Far-reaching changes in the material life of Europe brought about the “rise of the machine” in the Renaissance (Sawday 2007), a development with world-historical consequences. To this day the pace of this mechanization of culture in Europe and the rest of the world shows little sign of deceleration.

Macrocosm in Renaissance Philosophy

Abstract

After their introduction in ancient philosophical doctrines, the concepts of macrocosm and microcosm obtained new life in the Latin West and in the Renaissance. Initially interpreted within the tradition of Christian theology, macrocosm then became an important element of magical and astrological teaching. Although several Renaissance and early modern scholars approached the macrocosm concept from a philosophical point of view, in that age it belonged basically to magic.

Heritage and Rupture with the Tradition

The concept of macrocosm and its relation to that of microcosm date back to antiquity, when two approaches to the problem were developed. The first argument, *ad* microcosm, states that every human being has nothing *in se* besides cosmological elements, and thus macrocosm descends and reflects itself in the image of microcosm. Another approach, *ad* macrocosm, insists on the existence of a cosmic soul, which has the immanent God as its prototype. This doctrine, widely presented in the writings of Plato, Plotinus, and other Neoplatonists, was later accepted by the Christian theological tradition. Commenting on a biblical passage on the creation of man in accordance with God's image and likeness, early Christian theologians used the philosophical argument in order to reveal a special position of man in the universe.

In the twelfth and thirteenth centuries, the macrocosm and microcosm concepts received their magical dimension. For medieval astrologers, different parts of the human body corresponded to zodiacal signs, thus making the former subordinate to the latter. This idea reveals itself in one famous illumination from the *Très Riches Heures du Duc de Berry* manuscript. It represents a woman with 12 zodiacal signs placed on her body, depending on the parts of the body they govern upon. This approach was also largely accepted within medieval and Renaissance astro-medical practice.

In the Renaissance, the trends were similar. Being still loyal to religious interpretations of macrocosm-microcosm, Renaissance scholars extensively adapted a magical reading of the concepts in question. Giovanni Pico della Mirandola is a good example. In his *Oratio* (later supplemented with the *De hominis dignitate*), Pico combined both approaches creating a legendary dialogue between Adam and God on the position of man in the universe (Pico della Mirandola, 2003: 8–10, 12). Pico's interpretation of the relation between macrocosm and microcosm deeply influenced the

subsequent tradition marking a turn to a more magically orientated view. For the sixteenth-century and seventeenth-century scholars, such as Robert Fludd, macrocosm became an important part of their magical theories and was often associated with the source from which positive astrological or other occult impulses should be acquired in order to either cure the soul or the body or cognize the essence of the world structures. The Renaissance and early modern intellectual culture have a number of significant examples of using the macrocosm-microcosm doctrine in philosophy. It includes Leibniz whose monads refer to the first being or the One and have its attributes *in se*. Luca Pacioli in his *De divina proportionem* and Leonardo da Vinci with his *Vitruvian Man* reproduced the same idea with the use of mathematical arguments and without referring to magic. However, from the sixteenth century onward, macrocosm belonged to magic, with the Rosicrucian Enlightenment as the peak of its magical interpretation.

Abstract

In an intellectual climate, in which natural philosophy was to operate as a separate discipline and its assumptions only on rational criteria, Maggi built his original writings. He is the son of a time in which Aristotle had to defend his right to coherently explain the empirical phenomena only on the basis on rational and philosophical principles, without using theological arguments. Following this specific teaching, Vincenzo Maggi is famous for his Latin Commentary on Aristotle's *Poetics*, published in 1550 in Venice. The exegesis of the Greek text can clearly be integrated with a broader context of the first attempts of translation and analysis of Aristotle's thought, up to the production of Paolo Beni in 1613. Specific criteria adopted by the Brescian philosopher are at the origins of modern hermeneutics centered on the analysis of the subject of imitation, essential in the poetic theory of Aristotle, and the purpose and moral function of poetry.

Biography

Vincenzo Maggi, philosopher and humanist, was born into an aristocratic family in Brescia, where his parents were landowners and ran a pharmaceutical store. Thanks to the information that Maggi himself provides in *Praefatio* to Aristotle's *Poetics*, we know that his first teacher was his father Francesco, who taught him the cultural legacy of the brilliant philologist and lexicographer Gasparino Barzizza. In particular, Barzizza was the promoter of the general spirit of renewal that animated Italian humanism. The literary works of the ancient express the desire to assimilate the spirit, in order to create a new ethical way of life which is *humanitas*. Maggi's formation is completed with university courses promoted by the University of Padua when, in 1528, he was nominated *doctor artium et medicinae*. In the same period, Bernardino Telesio was in Padua, and probably, in 1528–1529 there was their first encounter. Telesio, at that time, was a young philosopher who attended the *Studium*'s environment of Padua until 1529, when his uncle Antonio Telesio decided to return to Calabria. The University of Padua, as well as Bologna and Pavia, was the driving force behind Aristotelian studies. Since the end of the thirteenth century and through the Renaissance up to the sixteenth century, the *Studium* is dominated by a specific Aristotelian approach, which will prevail the Alexander of Aphrodisias's line. Maggi taught in Padua from 1528 to 1543, and then in Ferrara from 1543 to 1557, he had an Alessandrian orientation embodied, which pushed Bernardino Telesio to submit in 1563 the *De natura iuxta propria principia, liber primus et secundus*, for getting advice and comfort. This illuminating encounter will be remembered by Telesio in the preface of the first edition in 1565. In 1540, Maggi becomes a member of the Academy of Inflammati in the most intense years of the debate about the classification of knowledge, logic and rhetoric, and the language issue. We must not forget those who animated the scientific debate: illustrious generations of writers such as Alessandro Piccolomini, Sperone Speroni, Daniele Barbato, Leone Orsini, and Pietro Aretino. In Padua, philosophy was

gradually considered a discipline linked to the faculty of medicine and not as a higher preparatory faculty of theology. Following these specific aspects, Maggi's commentary shows that the ethics of poetic construct was built on the relationship with the *Ars poetica* by Horace, which highlights the social utility of poetry and Aristotle's *Poetics*, in which he devotes considerable space to human passions. Where Aristotle locates in pity and terror the passions that the tragic exercise should purge; Maggi notes that the tragedy will not purge the soul with pity and terror, but with the feelings that are caused to each other, like anger and lust. The work conducted by Vincenzo Maggi will not be a mere translation of Aristotle's text, but an interpretation and analysis, in other words, a piece of work that was at the same time philosophical and philological. He held the post of *magister* up to 1543 as an excellent commentator of Aristotelian texts, which sought clarification on the latest debate of logical-physical speculation and rhetoric. In the same year, following the post of tutor to Prince Alfonso d'Este, Vincenzo Maggi moved to Ferrara. This period marked a turning point in his intellectual and personal life. In fact, this change is reflected in the notes of his lessons on *Poetics* held from 1546 to 1547, written by his disciple Alessandro Sardi. We can understand the decision to publish in 1550 in Venice, along with the comments of Aristotle's *Poetics*, a work dedicated to Horace, *De ridiculis*. It shows the ratio of hermeneutics and the method as a desire to integrate *Aristotelis cum Horatio*. The *Brieve Trattato* presents a rigorous clarity of form, and the arguments are conducted with scientific rigor, offering right from the start three groups of tests that would be able to demonstrate not only the excellence of women but also their superiority.

Magistros, Thomas

Born: c. Thessaloniki 1275

Died: c. Thessaloniki 1350/51

Abstract

Thomas Magistros was a Byzantine scholar of the fourteenth century. He was one of the most ardent and perhaps the most significant classicist of his era. Due to his natural love for knowledge, he was bestowed with great success as an orator and a scholar.

Biography

Thomas Magistros was born in Thessaloniki, around 1275 (Skalistis 1984, p. 27), but the exact year of his birth remains unknown. He came from a wealthy family and obtained high education. At that time Thessaloniki, following Constantinople, was the largest center in trade, arts, and literature, and such conditions formed an ideal atmosphere that contributed to the appearance of a strong

spiritual movement with many well-known representatives such as Thomas Magistros. He was commissioned as Grandmaster of the Court before becoming a monk. Although it is not known to which monastery Magistros retreated as a monk, it is highly probable that it was in the area of Thessaloniki. While a monk, he adopted the name “Theodoulos.” He established (Skalistis 1984, p. 217) his own school with students who were later supposed to play a significant role in the Byzantine Empire’s life: Grigorios Akindynos, Philotheos Kokkinos, and Demetrios Triklinios to name a few. He also held contact with well-known figures of that period such as Theodoros Metochitis, Nikiforos Grigoras, Aggelos Palaiologos, Ioannis Katakouzinos, and many others (Laourdas 1960) that became actively involved in numerous crucial events (Τριαντάρη-Μαρά Σωτηρία, *Η πολιτική σκέψη στη Θεσσαλονίκη του 14^{ου} αιώνα – Θωμά Μαγίστρου τοις Θεσσαλονικέσι περί Ομολοίας, Βυζαντινά κείμενα, Ηρόδοτος σελ. 28–37.*). He died in Thessaloniki around 1350/1351.

Innovative and Original Aspects

Thomas Magistros embraced quietism, and his quietistic inclination is shown in his whole work, in which an erotic approach toward knowledge is prominent. At the same time, he condemned political instability, violence, and opposition toward legitimacy however defined. Furthermore, he praised the benefits of concord, an important democratic element the states should have. His work consists of various speeches (epideictic rhetorical speeches), letters to influential people of his era, rhetorical practices, and treatises.

Impact and Legacy

Thomas Magistros gained great acknowledgment in and out of Thessaloniki, and his work had a huge impact on Byzantine society before and after his death. His most important treatises on *the Kingship* and the *State* highlighted the relations (Lenz 1963) between authorities and people, or even among themselves, along with the effects of

power in common life. Furthermore, he introduced the concept of concord as a prerequisite for a prosperous and democratic state. His dictionary “*Selection of Attic names*” offered a useful tool to the students of the Attic language for a better understanding and learning acquisition. On top of this, his speeches contributed to fourteenth-century rhetoric.

Magnetism in Renaissance Science

Abstract

The study of magnetism was an important field of Renaissance natural philosophy and the practical sciences. Scholars examined the powers of the magnet (i.e., the lodestone or loadstone) by experiments and observed the magnetic properties of the Earth, for example, the direction and declination of the compass needle, by means of instruments and long-term observations. In 1600, William Gilbert published the first extensive study on magnetism (*De magnete*) and claimed the Earth was

a giant magnet. While most philosophers rooted in medieval Scholasticism and Galenism deemed it impossible to analyze the physical causes of magnetic phenomena, several Renaissance philosophers attempted to explain the powers of the magnet within a range of different philosophical frameworks. Philosophers such as Pierre Gassendi and René Descartes imagined particles being emitted by a magnet, while others attributed animal-like behavior to it. Aside from this type of investigation, magnetism also figured as an explanatory principle or as an analogy in various contexts. The very term *magnetismus*, for example, was coined by Andreas Libavius in a 1597 work on alchemy. During the seventeenth century, a controversy emerged around Gilbert's "magnetic philosophy," which accounted for the diurnal rotation of the Earth by its magnetic power. Johannes Kepler even considered certain planetary movements as caused by the magnetism of the sun.

Heritage and Rupture with the Tradition

The majority of Latin sources from Antiquity up to the Renaissance refer to the magnet or lodestone (which is a naturally magnetized piece of the mineral magnetite) by the Latin word "lapis magnes" (from the Greek word "λίθος μάγνης"). The Latin expression *magnetismus* however was coined only in the late sixteenth century and did at first not refer specifically to the magnet or to its power of attracting iron, but to attractive forces in general. The word "magnes" was also occasionally used to refer to particular minerals which were not magnetic in the modern sense, such as manganese. Moreover, scholars spoke of minerals such as the "theamedes" which they described as having the magnetic power of repulsion

(in the modern sense) (Sander 2017). Despite this complicated terminological situation, for the sake of simplicity, the words "magnet" and "magnetism" will throughout this article denote the mineral magnetite and its physical powers.

Sixteenth-century scholarship inherited much of its knowledge about magnetism from earlier periods. While Aristotle hardly mentioned the magnet, Pliny the Elder's *Natural History* provided a brief account of ancient mineralogical knowledge about the magnet (Radl 1988). Philosophers such as Alexander of Aphrodisias, Lucretius, Galen, and many others discussed the question of how magnetic powers are to be explained. The thirteenth-century scholar Petrus Peregrinus wrote the first surviving study in Western science (*Epistola de magnete*) describing magnetic powers systematically and on the basis of experiments. It included the first detailed account of a magnetic compass (Smith 1992; Petrus Peregrinus 1995).

Renaissance authors showed increasing interest in the study of magnetism. In particular, the English physician William Gilbert claimed in *De magnete* (1600) to have established a novel "magnetic science" (*magnetica disciplina*) that was purely based on experiments and solid reasons. This claim was explicitly directed against traditional Aristotelian natural philosophy, matter theory, and cosmology, and their supposedly "bookish" approach.

Innovative and Original Aspects

Overall, the original aspects of the Renaissance study of magnetism can be divided into three, partly interconnected research programs: (1) the observation of magnetism: What are the magnet's powers and properties and how can they be discovered? (2) the explanation of magnetism: How can we account for magnetic phenomena (e.g., attracting iron) in terms of natural philosophy? and (3) the comparison with other phenomena: What other (e.g., medical or astronomical) phenomena can be compared to, or even be explained by, magnetism? Of course, several authors contributed to more than one of these research

programs, for example, by using experiments to arrive at conclusions about the causes of magnetic phenomena. Gilbert intertwined all three programs to build his “magnetic philosophy.” However, the majority of sources focused on one of these three programs.

Observing Magnetism: Experiments, Discoveries, and Research

The historical knowledge of magnetic phenomena can be inferred from four types of sources: (1) Important sixteenth-century publications on the magnet (monographic studies or book chapters) include Peregrinus’s *Epistola* (Lullus 1520; Petrus Peregrinus 1558; Taisnier 1562), Gerolamo Cardano’s *De subtilitate* (Cardano 2004 [1550]), Robert Norman’s *The new attractive* (Norman 1581), and Giambattista Della Porta’s *Magia naturalis* (Porta 1589). The most important extensive (printed) study on the magnet is William Gilbert’s *De magnete* (Gilbert 1600), which was in due time followed by two monographs by Jesuit authors, Niccolò Cabeo’s *Philosophia magnetica* and Athanasius Kircher’s *Magnes* (Cabeo 1629; Kircher 1641). (2) A particularly important manuscript on magnetism (*Tratatti della calamita*) was written by the Jesuit Leonardo Garzoni around 1580 (Garzoni 2005; Sander 2016). His work was partly incorporated into Della Porta’s *Magia*, was known to Fra Paolo Sarpi, and was reworked by Cabeo. (3) Several authors, including Johannes Kepler, Marin Mersenne, and Galileo Galilei, discussed the topic of magnetism frequently in their respective correspondence with often less known contemporary scholars. These sources often report recent discoveries but remained mostly unpublished. (4) Few surviving scientific objects, such as the so-called armed magnets (see below) and magnetic instruments (like nautical compasses or sundials with magnetic needles), also bear witness to their makers’ knowledge of magnetic phenomena. Maps or globes furthermore bear witness to the acquaintance with geomagnetic phenomena, for example, by locating magnetic poles on the earth.

It can be inferred from these sources that sixteenth-century authors discovered many magnetic phenomena that had been unknown before. This increase in knowledge partly derived from the fact that the use of the magnetic compass became much more important, especially for intercontinental voyages of discovery. Moreover, it can be observed that the experimental approach to magnetism, which is already found in some medieval works on the topic, gained momentum in the Renaissance, mirroring a novel understanding of nature and a new methodological approach to natural philosophy.

Peregrinus and his late-medieval contemporaries had already known that a magnetic iron needle pivoted in a compass points north. Sundials with magnetic needles fabricated around 1450 testify to their makers’ knowledge that the needle’s southward direction deviated from the true astronomical south (which was called “magnetic declination” or “variation”) (Hellmann 1897; Balmer 1956; Jonkers 2003). Navigators of the late fifteenth century were moreover aware of the fact that this declination changed with geographical longitude, giving rise to the hope of finding longitude positions by means of specific patterns of magnetic declination. In 1544, Georg Hartmann first described how a magnetic needle aligns itself vertically (“magnetic inclination” or “magnetic dip”) (Hellmann 1898, 65–66). Robert Norman assumed that the angle of inclination varied according to geographical position. In 1634, the Englishman Henry Gellibrand pointed out that local variation also changed at a given place over time (“secular variation”) (Pumfrey 1989). Most of these geomagnetic discoveries and research studies were conducted by instrument makers or scholars from the nautical or geographical sciences.

Scholars also examined the properties and powers of the magnet itself, for example, its two poles, the ways these poles can be found, and how a magnet is able to communicate its powers to a piece of iron. Peregrinus and Gilbert experimented with spherical magnets or magnets floating on wooden vessels on water. Other scholars attempted to measure the strength of the magnetic attractive power and tried to find out how this power could be increased or decreased

by means of chemical experiments, for example, by putting a magnet in garlic juice, quicksilver, iron fillings, or fire. Gilbert invented the so-called “armed magnet,” a magnet capped with iron plates to enlarge its power to lift a piece of iron.

Explaining Magnetism: Causal Theories in Natural Philosophy

The magnet’s power of attracting and repelling iron and its power of aligning along a north-south axis posed serious explanatory difficulties to theories seeking a causal explanation of these phenomena. While ancient natural philosophers only dealt with explanations of magnetic attraction, medieval authors were aware of the directive force of a compass needle and reasoned about the celestial cause of this alignment to the north (Weill-Parot 2013). Renaissance authors developed a variety of causal theories for both phenomena – attraction/repulsion and north-pointing – which often followed ancient or medieval ideas but were elaborated in much greater detail (Daujat 1945).

Natural philosophers influenced by Galenic medicine and Aristotelian medieval scholasticism considered it impossible to explain the magnet’s powers by its elementary qualities, such as “heat” or “dryness.” They, therefore, assumed an unperceivable “occult power” that causes the magnet to attract iron or point north (Weill-Parot 2013, 27–136). Many Renaissance philosophers were unsatisfied with this assumption, feeling that “occult qualities” or “powers” provided no satisfying explanation at all. Instead, they proposed various alternative accounts, such as the following:

(1) Gerolamo Fracastoro and others assumed the emission of immaterial yet substantial “species” to account for magnetic phenomena, which they took to be an instance of natural “sympathy” (Fracastoro 2008, 29–39). (2) Cardano and others held that a magnet sought iron as an animal seeks food (Cardano 2004, 664–77). Thereby, magnets were considered to be endowed with basic animal faculties and even a soul. (3) Aristotelian philosophers such as Garzoni and Cabeo used and

modified Aristotelian principles (hylemorphism) to account for magnetic phenomena by assuming a particular “magnetic quality.” (4) Corpuscularian philosophers such as Isaac Beeckman or Pierre Gassendi imagined that tiny particles were emitted from a magnet, travelled through the air, and entered the iron. René Descartes even hypothesized in his *Principia philosophiae* (1644) that magnetic particles possessed a screw shape and that all magnetic bodies had fitting threads that allowed these specific particles to enter them (Descartes 1964, VIII: 275–311).

Different hypotheses were also formulated to explain the north-pointing of the magnetic needle. Most medieval authors assumed a celestial cause, for example, the astral influence of the pole star. In the sixteenth century, Fracastoro and Gerhard Mercator thought that a magnetic needle pointed to magnetic mountains located on the Earth. The foundation of a geomagnetic theory was laid by Gilbert who argued that the Earth itself was a giant magnet (Roller 1959; Pumfrey 1987). Gilbert tried to demonstrate this theory by experiments with spherical magnets he called “little earth” (*terrella*) which he presumed to possess the same magnetic properties and powers as the Earth itself. In Gilbert’s view, the irregularities of the Earth’s crust are the cause of the local magnetic variation (see section “[Observing Magnetism: Experiments, Discoveries and Research](#)”). As for the cause of this earthly magnetic power, Gilbert thought that the Earth was endowed with a soul (Henry 2001).

These debates on the causes of magnetic phenomena reflect the broader development of natural philosophy in the early-modern period, particularly the polemics against Aristotelian natural philosophy and the emergence of a mechanical, corpuscularian philosophy.

Comparisons: Magnetic Power as Analogy or Explanatory Principle

In Renaissance philosophy and science, magnetism was also used as an analogue or explanatory principle in order to account for a range of natural

phenomena. The most important disciplines, topics, or research contexts in which magnetism played a pivotal role include (1) cosmology, (2) medicine, and (3) alchemy – leaving aside its frequent use in theology, astrology, and natural magic.

1. Because of the supposed similarity between a spherical magnet and the celestial sphere, already Peregrinus had claimed that a spherical magnet would rotate around its own axis in keeping with the movement of the heavens. Gilbert, whose starting point was his geomagnetic hypothesis combined with an idiosyncratic theory of matter (Freudenthal 1983), argued that the rotation of a spherical magnet, when it aligns itself with the poles of the Earth, resembles the latter's diurnal rotation. He thereby tried to account for the geodynamic hypothesis proposed by Nicolaus Copernicus in 1543. Johannes Kepler adopted Gilbert's idea of magnetic powers of the Earth and developed a full-fledged magnetic cosmology, with the sun being a giant magnet that caused and directed the movements of the planets (Krafft 2010). Both Gilbert's and Kepler's magnetic cosmologies were harshly criticized, especially by Catholic authors who were fighting against physical Copernicanism (Baldwin 1985) and proposed their own geostatic magnetic cosmology (Grandami 1645).
2. Magnetic attraction was already used as an analogue in ancient and medieval medicine. The attractive power of some organs (e.g., the liver), faculties (e.g., nutrition), or purgative drugs (e.g., rhubarb) seemed to resemble the magnet's attraction of iron. In the early-modern period, this kind of analogy was further fleshed out. The philosopher and physician Paracelsus described the curative power of some drugs as magnetic (Rutschow 1965). He also believed that man himself was a magnet attracting healthful or harmful influences from his environment. This idea led to the invention of an obscure cadaveric substance called "mumia" that was considered to

magnetically retrieve harmful substances or "influences" of a sick person. In the early seventeenth century, these ideas merged with the so-called "weapon salve," an unguent that was to be applied to the weapon instead of the wound which it had inflicted (Poma 2009). Rudolph Goclenius (jr.), Jan Baptist van Helmont, and Robert Fludd argued that this healing process worked at a distance by magnetism.

3. In 1597, Andreas Libavius coined the Latin expression *magnetismus* in his handbook of alchemy (Libavius 1597, 86). He did not apply this expression to the powers of the magnet in particular but more generally to the attractive powers of specific minerals or chemical substances. This generalizing notion led to the idea that attractive powers could also be transferred (from one body to another, such as when iron was magnetized). In the alchemical works ascribed to Basilus Valentinus or those by Michael Sendivogius, the expression "magnet" denotes various substances that show a particular chemical affinity to other substances or are attractive in one way or another (e.g., Basilus Valentinus 1603, 85–86; Sędziwój 1604, 64).

The most comprehensive account of the various "magnetisms" of nature can be found in Athanasius Kircher's *Magnes* (Kircher 1641; Baldwin 1987). Kircher discusses the magnetic faculties of plants, elements, animals, the Earth, and many other things. He also synthesized and extended the use of the magnet in tricks and gadgets of natural magic such as a magnet-driven sunflower clock. He inclined to the view that magnetism is a principal and irreducible power governing various aspects of nature.

Abstract

Valerian Magni was a member of the Capuchin Order, a diplomat, and an ecclesiastical politician. He was a keen opponent of Aristotelianism, Jesuit Scholasticism, and the Jesuits. In his philosophical writings, he followed the tradition of Augustinianism and the philosophy of St. Bonaventure, which he attempted to elaborate into a system with certain aspects of modern subjectivist philosophy. He also advocated certain elements of new Galilean science, first and foremost the existence of the void, which he demonstrated experimentally.

Orthodox Church. His irenic efforts culminated with the preparation of the so-called Colloquium Charitativum which took place in Thorn in 1645 but at which Magni was eventually not present (Louthan 2004). After the condemnation of Galileo Galilei, Magni unsuccessfully attempted to publish his *Discorsi e dimostrazioni matematiche intorno a due nuove scienze*. He conducted an experiment proving the existence of vacuum, in all probability independently of Torricelli and Pascal, in 1647 in Warsaw. The publication of the description of the experiment (Magni 1647), which was the first printed text describing an experiment with a vacuum, aroused a polemic not only with the Aristotelians but also with scholars who admitted to the existence of the void but were concerned with the authorship of the experiment, such as Gilles de Roberval and Blaise Pascal. At the end of his life, Valerian continued with his polemics and confessional disputations. He intensified his attacks on Aristotelian scholasticism and on the Jesuits (Magni 1660), whom he considered the root of every falseness in the Catholic Church. He was arrested in Vienna and sent to see the Pope in 1661. He died in Salzburg on the way to Rome.

M

Biography

As a young man, Magni entered the Capuchin order in Prague where he received the order name Valerian. After his studies at the Capuchin monasteries in Vienna and Prague, he worked as a diplomat, superior, and professor of philosophy at the monasteries in Linz, Vienna, and Prague. He later (from 1624) served as an advisor to the Prague Archbishop Cardinal Harrach and as a legate of the Congregatio de Propaganda Fide (from 1629). He was involved in contemporary polemics concerning the re-catholization of the Czech Lands, where he advocated nonviolent methods and controversies concerning the organization of Prague University. He was a keen opponent of the Jesuits in both cases. Valerian can often be found at the court of the Polish King Vladislav IV, for instance, in 1633, when he worked on creating a union between Catholics and the

Magni's Philosophy

Magni published his first philosophical fruit at the age of 56 (Magni 1642). He continued with the intellectual tradition of the Capuchin order following the philosophy and theology based on the authority of St. Augustine and St. Bonaventure, which he tried to elaborate into a scholastic system. This elaboration, although professing a dependence on medieval sources, has a tendency toward a modern subjectivist approach, as a philosophy starting from the philosopher's own mind, from "the ego," but also revealing traces of Renaissance Platonism.

The concept of light plays a central point in Magni's philosophy. Light has a crucial epistemological function as a condition of visual perception and analogically in rational cognition, which is not possible without the aid of mental light. Light also has an ontological function, for every

existing being in the realm of existing objects is dependent upon being in the mental light, which is the perfect being and is identical to God. Magni conducted his experiments in vacuum within this context. These reveal that light, which is visible in the void, is not dependent on any material subject, thus the priority of light is demonstrated (Magni 1647).

Magni denounces Aristotelian scholasticism as atheistic philosophy which is not in concord with Christianity. He also criticizes its inner inconsistency from the philosophical point of view and its incompatibility with new science. He later tended to accept Galileo's heliocentric cosmology (Cygan 1969). His last philosophical work (Magni 1661) began with a long description of Aristotle's philosophy and its refutation and proceeds with a presentation of Magni's own philosophy of consciousness based on introspection (Blum 1998), which seems to anticipate Immanuel Kant's a priori pure forms of intuition (Sousedik 1982, 2009).

Magni did not have any direct followers. Apart from contemporary debates and polemics, his works were later read by N. Malebranche, G. W. Leibniz, and Ch. Wolf.

Magnidecentia

► Magnificence in Renaissance Philosophy

Magnificence in Renaissance Philosophy

Abstract

Magnificence has become a significant subject in discussions of Italian Renaissance art, particularly architecture, since it came to widespread attention in the early 1960s as a justification for large-scale architectural, urbanistic, and artistic patronage, and other forms of prominent display, for which it is now often used as a synonym.

Aristotle described magnificence as a moral virtue comprising the decorous expenditure of significant wealth on public display. In this form, it was the subject of brief but influential discussions by Cicero and treated at length by Thomas Aquinas. In descriptions of patronage, the concept emerged in the mid-fourteenth century; in the fifteenth and sixteenth centuries, it appeared in works of moral philosophy and household management, and conduct books, as well as panegyrics and eulogies.

Magnificence provided a means of working out the role in politics and society of architecture and other forms of lavish expenditure. Fifteenth-century texts often contest the appropriateness of magnificent expenditure in particular arenas (the communal versus the familial) and in different political contexts (republics versus courts). An especially rich cluster of texts centered on Florence in the period c. 1400–1465, contrasting with texts produced in courtly cultures.

Magnificence can be related to, and in some cases may have provided the impetus for, significant building campaigns by oligarchs and aristocrats. We can deduce from the texts a set of critical categories for assessing the magnificence of architecture (scale and quantity, materials, decoration, and architectural articulation, the *all'antica* style, and comforts and amenities). In the sixteenth century, the importance of decorum in magnificent display led to ever subtler distinctions between the aesthetic and material qualities of objects.

Heritage and Rupture with the Tradition

Renaissance discussions of magnificence are as much about heritage as they are about rupture. Three concepts of magnificence had evolved by late antiquity: rhetorical, relating to the “grand

style”; theological, relating to the soul’s divinity; and moral, the virtue of spending large sums of money on public display (Jaeger, Rossi Monto and Dillon in Jaeger 2010). The last of these was seized on by Renaissance commentators interested in the correct use of money and the duties of rulers. As a virtue, magnificence is an epithet applied to people (almost always men), but from antiquity onwards, it has also been applied to the magnificent man’s expenditure and its fruits (Binski and Williamson in Jaeger 2010).

Aristotle provided the enduring definition of moral magnificence, *megaloprepeia*, in the *Nicomachean Ethics* (II.vii and IV.ii): it is a moral virtue in its own right and consists of spending great amounts of money on a large scale on suitable but grand and stylish things. It is a mean between shabbiness and vulgarity, and related to liberality, but on a larger scale and concerned only with expenditure. The results obtained will be suited to the spender, the quantity spent, and its object, but will be more impressive than merely liberal expenditure of the same amount: magnificence is judged not on an absolute scale, but in relation to its context. Nonetheless, it is restricted to the rich and powerful, as only they can afford to sustain that level of expenditure; equally, it befits only people of their status. Suitable objects of magnificent expenditure are primarily religious (offerings, buildings, sacrifices) and public (paying for a chorus or a ship, public entertainments), but also private occasions that occur once (e.g., weddings) or benefit the city (the welcome and valediction of foreign guests, exchanges of gifts, furnishing one’s house). The notion of fittingness and decorum (*prepon*) contained in the Greek *megaloprepeia* pervades later discussions, although it is lost in the usual Latin translation, *magnificentia*, which instead emphasizes making (*facio*).

Renaissance commentators frequently referred to Cicero, whose attitude was more ambivalent. In his youth, he defined magnificence straightforwardly as a virtue, considering it to be a form of fortitude (*De inventione* II.liv.163); he later adopted a less straightforward attitude, criticizing magnificent display but at the same time acknowledging that magnificent entertainments were

expected of the aediles by the public (*De officiis* II.xvi.56–57). This ambivalence is encapsulated in his dictum that “the Roman people hate private luxury, but love private magnificence” (*Pro Murena* xxvi.76), and the statement, not specifically referring to magnificence but often quoted in discussions of the virtue, that “the owner should bring honour to his house, not the house to its owner” (*De officiis* I.xxxix.139).

The most significant medieval author on the subject – particularly given the number of renaissance Dominicans who discussed it – was Thomas Aquinas, in both his commentary on the *Ethics* and his *Summa theologiae* (Thomas Aquinas 1964b, II.viii and IV.vi–vii; Thomas Aquinas 1964a, 2a2æ, art. 134). He differs from Aristotle in considering magnificence to be a subsidiary form of fortitude (it does not deal with physical threats) and in his emphasis on the direction of magnificent expenditure to religious objects, placing these above the communal good. He also stated in his *Summa* that magnificence need not be restricted to the rich and powerful: the poor, too, have the potential to be magnificent, even if they lack the necessary resources. In his commentary on the *Ethics*, he added a further example of magnificent expenditure: military service.

We find Aristotle, not Thomas Aquinas, cited directly in the Dominican Galvano Fiamma’s account of Azzo Visconti’s funding of festivals, public works, and particularly buildings and their decoration, written in the early 1340s (Fiamma 1938, xv–xx, xxiii–xxv and xxvii–xxix; cf. Green 1990; Marina 2010). Fiamma emphasized that it is a prince’s duty to spend magnificently; among the benefits is the intimidation of a restless populace, dumbfounded by such magnificent display. Unlike his more analytical predecessors, he described the fruits of Visconti’s expenditure at length, giving as much space to his palace in Milan as to the palace chapel: he was interested in the objects of magnificence, not their nature.

Fiamma was followed by a series of Renaissance eulogists and panegyrists, who used descriptions of buildings, festivities, and other displays of the fruits of expenditure, explicitly characterized as magnificent, to praise either cities or patrons, beginning with Leonardo Bruni’s

panegyric of Florence in his *Laudatio* of the city, written c. 1403 (Bruni 1968, pp. 232–243), the first of a cluster of texts originating in Florence from the early 1400s to the 1460s.

Those writers who analyzed magnificence produced definitions little different from the Aristotelian/Thomist position: in Florence, Bruni again, in his *Isagogicon moralis disciplinae*, written 1421–1424 (Bruni 1928, p. 32 ll 5–17), and the Dominican Antonino Pierozzi, later canonized as St Antoninus, in his *Summa theologica* (Antoninus 1740, I.i.3 §2 and IV.iii.4–6; the main section reprinted in Howard 2012). Antoninus began compiling the work in the late 1420s; the section on magnificence was completed by 1450, but had been taken verbatim from Henry of Rimini’s *De quattuor virtutibus cardinalibus*, written shortly after 1297. Although Marsilio Ficino’s fundamental definition of magnificence in *De virtutibus moralibus* of 1457 (sometimes called *De magnificentia*) differed little from that of his contemporaries, he was unusual in framing it with a discussion of the definitions of virtue in the various ancient schools of philosophy, considering it pre-eminent among the virtues classed as *modestia* by the Platonists (Ficino 1937).

Some writers combined analysis with eulogy: Timoteo Maffei accompanied a brief encomium of Cosimo de’ Medici’s buildings with a justification of his magnificence in the form of a dialogue, using the arguments of Aristotle, Cicero, and Thomas Aquinas, in his *In magnificentiae Cosmi Medicei detractores libellus* of c. 1454–1456 (cf. Gombrich 1966; Fraser Jenkins 1970; published in Maffei 2012). This was followed by Alberto Avogadro’s hyperbolic account *De religione et magnificentia . . . Cosmi Medices* of the early 1460s (Avogadro 1736, pp. 117–149; corrected version of pp. 127–139 in Gombrich 1962). Cristoforo Landino, writing *De vera nobilitate* after 1487, broke magnificence down into four components: glory, scale (*amplitudo*), inclination (*studium*), and execution (Landino 1970, pp. 70–71).

Magnificence was also discussed outside Florence, but still within a broadly republican context, by the Venetian Giovanni Caldiera, who, in *De virtutibus moralibus et theologicis* of c. 1464,

considered it among the virtues practiced by individuals (Caldiera 1464a, fols 38v–40r; cf. King 1975) and by Alessandro Piccolomini, in *De la institutione di tutta la vita de l'huomo nato nobile e in città libera*, dedicated in 1540 (Piccolomini 1543, V.v). The republican eulogies culminate in Benedetto Varchi's account of the fabric of Florence and its territories as they were in 1527 (and earlier) in his *Storia fiorentina* of c. 1545 (Varchi 1963, IX.xxxiii–xxxiv and xxxviii–xli).

From the 1440s, however, we see a growing interest in magnificence in Italian court circles. Unusually, Francesco Filelfo used the more literal *magnidecentia* for the Greek *megaloprepeia* in his *Convivia mediolanensia* of 1443 (Filelfo 1537, pp. 78–82). Giannozzo Manetti praised Alfonso I of Naples's magnificence in orations of 1445 and 1452 (Manetti 1445, fol. 2v; Manetti 1452, fols 10r and 11r), and Nicholas V's in his extensive account of the pope's building projects in his *Vita Nicolai V*, composed 1455–1458 (Manetti 1958). Panormita, too, lauded Alfonso I's magnificence when writing about his words and deeds in 1455 (Panormita 1538, I.23, I.35, I.39, I.61, IV.3, and IV.4). Staying with Naples, Giuniano Maio gave a fairly thorough summary of the traditional position on magnificence, drawn from Aristotle and Cicero, in the chapter on magnificence in his treatise *De maiestate* (1492). He associated it principally with kings, in particular Ferdinand I of Naples, and gave five examples of Ferdinand's magnificence, three of which are lost due to a lacuna in the sole surviving manuscript. The remaining examples are atypical: Ferdinand's appearance while riding and his hunting (Maio 1956). The elder Filippo Beroaldo combined brief descriptions of the virtue with praise of the aspiring despot Giovanni II Bentivoglio in his commentary on Suetonius's *De vita Caesarum* and in his *De optimo statu* (Suetonius 1493, fol. 229r–v; Beroaldo 1497, sig. C.viii v). The culmination of the courtly eulogies is perhaps Giovanni Sabadino degli Arienti's long and detailed account of Ercole I d'Este's architectural and religious patronage in *De triumphis religionis*, written in 1497 in Italian, its Latin title notwithstanding (Arienti 1972, pp. 50–79 and 111–112).

By far the most extensive Renaissance discussion of magnificence is that in Giovanni Gioviano Pontano's treatise *De magnificentia*, written over a long period from the 1460s until its publication in 1498 (Pontano 1999a). While Pontano's fundamental definitions are not surprising, he included some innovations. He proposed that magnificent expenditure differs from liberality in often being directed to public pleasure. Magnificence is always disinterested, not considering the practical ends of expenditure, but focusing on the nobility of the result. It should not use ill-gotten funds. He provided a more detailed analysis of precisely what makes an object magnificent, identifying ornament, scale, quality of materials, and durability. Pontano's text also contains extensive examples of magnificent (and unmagnificent) behavior and works drawn from antiquity and living memory; these include a form of magnificence previously ignored in analyses and mentioned only by eulogists such as Fiamma: the keeping of animals, whether horses, hounds and hawks, or more exotic specimens.

Magnificence also appeared in treatises on the ideal forms of public and private behavior: Matteo Palmieri's *Della vita civile*, written between 1430 and 1438 (Palmieri 1982, III.207–210 and IV.213–218), and Platina's *De optimo cive* of 1474 (Platina 1944, pp. 207–208 and 229–230), a tradition which continued into the seventeenth century in household treatises such as Giovanni Battista Assandri's *Della economica ovvero disciplina domestica* (Assandri 1616, IV.xiv, pp. 305–306). Building on the courtly tradition which emerged over the second half of the fifteenth century, discussions of magnificence also appear in manuals of court management, such as Sigismondo Sigismondi's *Prattica cortigiana* (Sigismondi 1604, p. 23).

Apart from Palmieri's *Della vita civile*, magnificence was not discussed at any length in the vernacular until Maio and Arienti in the 1490s; yet by the 1560s, it was considered a suitable subject for discussion in the framing narrative of a set of *novelle*, Sebastiano Erizzo's *Sei giornate* of 1567 (Erizzo 1977, IV.xxii.4–15 and 17).

Innovative and Original Aspects

The significant number of texts on magnificence which originated in Florence is not surprising when we consider that one of the most contentious aspects of magnificence during the Renaissance was where it should most suitably be displayed. From Aristotle onwards, it was accepted that the most fitting objects of magnificent expenditure were religious: building and equipping temples, churches, and monasteries; funding religious celebrations and festivities; and accommodating pilgrims and the disadvantaged. Unsurprisingly, this aspect of magnificence was emphasized by Thomas Aquinas; and we find it, with varying degrees of emphasis, in all the texts mentioned so far, except for Landino, Beroaldo on Suetonius, and Assandri, while its omission by Sigismondi is perhaps explained by the fact that he was discussing the administration of a cardinal's court.

Next in suitability for Aristotle was magnificent expenditure directed to the common good, displayed in equipping of choruses or ships, and public banquets; and so we find public expenditure either specified as magnificent explicitly or implicitly in the lists of examples provided by the eulogists. Fiamma, keen to identify the virtue's political benefits, noted that it was the most visible form of the virtue. Communally directed expenditure also appears in Bruni's *Laudatio* and his commentary on the pseudo-Aristotelian *Oeconomics* (Aristotle 1542, fols 273r–285v, re I.vi, 1844b, on fols 280v–281r) and in St Antoninus's *Summa*. Poggio Bracciolini, in a letter to Francesco Bianchi de Velate of 1427, emphatically stated that magnificence consists in communal expenses (Bracciolini 1832, pp. 232–237). Palmieri, Manetti (*Vita Nicolai V*), Panormita, Caldiera (*De virtutibus*), Platina, Landino, Maio, Beraoldo (*De optimo statu*), Arienti, Pontano, and Erizzo all specify or describe communal displays of magnificence. Piccolomini repeated Pontano's characterization that magnificent expenditure could be directed towards one's city, one's friends or oneself – but it must always be disinterested.

By the time Pontano warned princes and kings to pay regard to public utility as well as beauty in

their magnificent projects, Aristotle's list of public works had been massively extended to include ports, piers, baths, aqueducts, theatres, loggias and porticoes, widening and paving streets, bridges, city walls, sewers, libraries, draining swamps, flood defenses, jousts, triumphs, weddings, funerals, hunts, gifts of money or in kind, and the reception of guests.

Aristotle also allowed that magnificent expenditure might be made on the celebration of unique occasions which arouse public interest such as weddings, the welcome and valediction of important foreign guests, and the exchange of (diplomatic) gifts, and on permanent objects, his sole example being the provision of a house for oneself. But the importance of decorum in displays of magnificence raised a problem in the case of expenditure on personal – or, in Renaissance terms, familial or dynastic – objects: if a magnificent building was matched to its owner's status, what was the owner claiming when his building was bigger than anyone else's?

The lists of texts in which we find familial magnificence – which Pontano saw embodied in palaces, loggias and porticoes, villas, towers, and tombs – are illuminating: those by Fiamma, Filelfo, Manetti (*Vita Nicolai V*), Panormita, Maio, Arienti, and Pontano, all writing in, or for, courts. Indeed, Maio stated explicitly that magnificence was most fitting for princes and kings and consequently made no distinction between the communal and the familial. The attitude which one took to magnificent expenditure on familial objects depended on the political context in which one was writing.

In Florence, therefore, where a series of factions – most successfully the Medici – tried to secure control of a nominally republican regime, magnificent expenditure which might seem directed to familial advantage was potentially suspect. Like Maio later in the century, Manetti and Maffei associated magnificence with princes; and Cavalcanti explicitly linked criticism of the patronage of Cosimo il Vecchio de' Medici to its magnificence (Cavalcanti 1839, xxxiii) – despite the religious nature of many of Cosimo's projects. And so Maffei, one of Cosimo's most emphatic apologists, argued for the virtuousness of familial,

communal, and religious expenditure. In emphasizing the communal benefits of potentially familial expenditure, he was following a long line of Florentines: Bruni (*Laudatio*), Antoninus, Bracciolini in *De avaritia* of 1428/9 (Bracciolini 1994, xii.6 and xiv.7), and Palmieri. The unquestioning praise of an extravagant version of Cosimo's buildings by Avogadro, writing in Vercelli in the Duchy of Savoy, remains exceptional.

Aristotle's examples of private magnificence thus became communal, something we also find beyond Florence: Caldiera, having mentioned the preparation of one's home in *De virtutibus*, returned to the subject in his accompanying treatise on economic and domestic life, *De iconomia* (Caldiera 1464b, fol. 91), emphasizing that a magnificent palace was an ornament to the city and a communal benefit, a point also made by Platina. Indeed, Pontano claimed that Cosimo de' Medici was the first person since antiquity to have devoted private money to the public good. The association of familial expenditure with the common good continued into the sixteenth century in Varchi's descriptions of magnificent palaces in Florence and Erizzo's *Sei giornate*.

The practical implications of the association of magnificence with political ambition were played out in Bologna, where Beroaldo had stated in *De optimo statu* that it behooves a prince to be magnificent, and where another oligarch, Giovanni II Bentivoglio, tried with partial success to obtain power over his city: following his effective expulsion from Bologna, his palace, called magnificent by Beroaldo, was destroyed by a mob in 1507.

Although he accepted that private display could be magnificent, Pontano developed the distinction between public and private further than other commentators by explicitly restricting magnificence to what was publicly visible – in other words, the exteriors of buildings. He called the corresponding virtue of expenditure on interiors, furnishings, and domestic goods “splendour” (*splendor*) (Pontano 1999b). According to Welch (2002), this innovation enabled the display of taste and discernment by wealthy commoners without impinging on the magnificence that was proper to royalty.

Impact and Legacy

Justification and Encouragement of Building

Fiamma stated that Azzo Visconti “conceived the intention of making a glorious house for himself, for the Philosopher says in the Fourth Book of Ethics that it is the duty of a magnificent man to make ready a decorous house” (Fiamma 1938; tr. Marina 2010), implying that his understanding of the theory of magnificence led him to build. While the rich and powerful have long shown a desire to spend their money on public displays, magnificence was used in the Renaissance both as a justification for such display and, it seems, as an impetus to magnificent behavior. The concept of decorum is again important: because magnificent display accords with the patron's status, by building magnificently, one displays one's virtue.

As early as 1371, the Signoria of Florence justified an extension to their palace “because it is customarily praiseworthy to decorate the city with the magnificence of buildings” (Spilner 1993); almost a century later, Avogadro claimed that Maffei's *In magnificentiae Cosmi Medicei detractores libellus* was the cause of Cosimo de' Medici's patronage of the Badia at Fiesole (text in Gombrich 1962). Recent discussions of the Florentine texts on magnificence have therefore examined them in terms of the use of wealth and the justification of large-scale expenditure on building in a republican context.

Similarly, the texts eulogizing rulers – Azzo Visconti (Fiamma), Pope Nicholas V (Manetti), Alfonso I of Naples (Manetti, Panormita), Ferdinand I of Naples (Maio), and Ercole I d'Este (Arienti) – treat magnificence as behavior expected of rulers. The buildings, projects, and events listed in their encomia show how far their subjects shared those expectations and behaved accordingly, to the extent that the eulogies have become important sources for the buildings themselves and their development.

Clarke (1999) has associated Giovanni II Bentivoglio's support for a series of improvements to the fabric of Bologna in the last 15 years of the fifteenth century, and his development of a vast palace and tower in the city, with

Beroaldo's descriptions of his magnificence, which seem in turn to have encouraged Giovanni to build further. It has also been suggested that magnificence provided the impetus for a boom in building in the other Italian courts in the second half of the fifteenth century, but the exact strength of the virtue's influence has still to be investigated (Fraser Jenkins 1970).

Social Distinction and Household Management

Guerzoni (1999), considering magnificence within the broader context of debates on liberality, luxury, and expenditure on domestic goods, has shown that it evolved in the sixteenth century from an aristocratic to a royal virtue. At the same time, as domestic goods became more widely available and affordable, so the lower classes' patterns of consumption and display increasingly ran the risk of emulating those of their social superiors, who in turn were in danger of needing to acquire ever more lavishly to embody their elevated position. This led to an increase in devices such as sumptuary laws for limiting the lower classes' display and to a series of ever nicer distinctions regarding the quality of goods being made in court accounting, and eventually more broadly, so that everything purchased could be matched as closely as possible to the rank of its consumer. Thus, even magnificent expenditure became the result of careful assessment and calculation.

Critical Vocabulary

Although strictly speaking an epithet applied to people, throughout the Renaissance "magnificent" was also applied to the fruits of their expenditure, especially buildings. Precise definitions such as Pontano's, that magnificence lies in ornament, scale, excellence of materials, and durability (Pontano 1999a), are few and far between; but the eulogistic texts, in particular, often describe buildings at great length, and the details of their descriptions, which emphasize certain aspects of the buildings, allow us to deduce with some precision what aspects of a building would imply its patron's magnificence. The most informative texts are those by Fiamma, Manetti (*Vita Nicolai V*), Maffei, Avogadro, Pontano, and Arienti.

Taking Pontano's first criterion, ornament included three- and two-dimensional carvings, external architectural polychromy, a great many mural paintings (primarily of secular subjects), mosaics, and carved ceilings. Related to this are architectural elaboration and sophistication: the use of vaults and cupolas, colonnades, and arcades. When Arienti referred to architectural features, they were classicizing, and Pontano specifically mentioned the revival of the antique style in the magnificent Palazzo Medici.

Scale is displayed both in absolute dimensions and in quantities: numbers of rooms or columns, for example. The most magnificent materials used in construction are polished stones such as marble and porphyry, and after that, other dressed stones (ashlar); even brick is praised on occasion. Of the metals, gold, silver, and bronze are singled out for attention; as is the use of gilding, blue pigments (i.e., presumably ultramarine), intarsia, and ivory.

Magnificent buildings may be notable for the extent of the accommodation that they provide, as well as comforts such as glazed windows, shutters, fireplaces, loggias, and lavatories. Amenities include even breezes and views and, outside, gardens, fountains, fishponds, and hunting grounds. Technical innovation, in the form of clocks, and in churches and monasteries, the paraphernalia required for religious celebrations also contribute to a patron's magnificence.

Historiography

Magnificence's most recent legacy, therefore, is its use as a concept that helps us to understand Renaissance culture. It first appeared in the secondary literature on Renaissance patronage in 1960, in Gombrich's influential article on the early Medici as patrons of art (Gombrich 1966). Since then, it has become a synonym for large-scale architectural, urbanistic, and artistic patronage, with works ostensibly about magnificence often leaving the term itself unexamined (Williamson 2010).

Subsequent examinations have pushed the introduction of the concept further back in time than Florence and the debates of the mid-fifteenth century regarding Cosimo de' Medici's patronage

described by Gombrich. In Florence, Howard has emphasized its development from the 1420s by St Antoninus (Howard 2008; Howard 2012), and Spilner identified its limited use in official Florentine documents from 1300 (Spilner 1993). But Green had already identified the deployment of magnificence to justify patronage as early as the 1340s and Fiamma's account of Azzo Visconti's patronage in Milan (Green 1990), and Marina has subsequently suggested that a concept of magnificent architectural patronage existed de facto in northern Italy in the thirteenth century (Marina 2010).

Over the last two decades, the discussion has expanded to include the context in which magnificence was displayed: Goldthwaite (1993, pp. 128, 204–210 and 214–224) and Guerzoni (1999) discussed magnificence in the broader framework of attitudes to wealth and consumption, Guerzoni emphasizing that the history of “conspicuous consumption” lies in Western thought. Welch (2002) and Lindow (2007) detailed the ways in which magnificence might be applied to the interiors and furnishings of buildings, and Shepherd has been concerned with the critical vocabulary implicit in descriptions of magnificent buildings (1998) and its relation to politics (2007).

Maimonideanism in the Renaissance

Abstract

Moses Maimonides is probably the most important, certainly the most influential,

Jewish philosopher of all times. Both his philosophical and juridical works became fundamental references to the Jewish culture already in his lifetime, but they also underwent several sharp critiques. During the Renaissance, his philosophical masterpiece, *The Guide for the Perplexed*, was either read according to the platonic orientation of the time or criticized as the main expression of an extreme rationalistic attitude; in both cases, it was universally admired and quoted. This is true also for the representatives of the so-called Jewish Averroism during the Renaissance; in fact, these authors were Maimonidean-Averroists.

The prestige of Maimonides was great among Christian scholars, too. His philosophy inspired some important Christian cabalists, and the *Guide* was translated into Latin and considered a work important for religious thought in general, which was exceptional, in a period of widespread rebuttal of the Jewish postbiblical doctrines, seen as false and vane. The *Mishneh Torah*, the main juridical work by Maimonides, was also partially translated into Latin, when the curiosity for Jewish laws and rites grew in the Christian world.

The Reception of Maimonides' Work in Different Ages

Moses Maimonides (Cordova 1238–Fustat, Egypt, 1204; in Hebrew Moshe ben Maimon, in Arabic Musa ibn Maimun) is unquestionably the most important author in the history of Jewish philosophy, as witnessed by the continued interest in the most important of his works throughout the ages, i.e., *The Guide for the Perplexed* (Arabic: *Dalalat al-hairin*; Hebrew: *More nevu'ukhim*, completed 1190), as well as by the multitude of reactions that this work has aroused. Although it is true that Maimonides was already being criticized during his lifetime for what was considered excessive rationalism, which implicitly denied the validity of certain beliefs deemed to be tenets of religion (such as the resurrection of the dead), it is also true that the *Guide* was immediately

translated from Arabic into Hebrew by Shemuel ibn Tibbon from Lunel in Southern France, with the collaboration of the author himself: this alone is a proof of the prestige enjoyed by his work among the non-Arabic-speaking Jews, who wished to read it as soon as they could.

This philosophical work became the pivot around which revolved, during the thirteenth century, all judgments in favor of or against the study of philosophy, which agitated the Jewish communities in Southern France and Catalonia and ended up with a series of excommunications and counter-excommunications and even with the burning of some of Maimonides' writings by the Christian authorities.

Commentaries on the *Guide* have been numerous and emerged quite early on: some appeared already in the thirteenth century, in Spain and Italy (Shem Tov ibn Falaquera, *Moreh ha-Moreh*, "Guide to the Guide", Moshe of Salerno, Zerahiah Hen); they reached further elaboration in the fourteenth century in Southern France and Catalonia (Yosef ibn Kaspi, Moshe Narboni, Profiat Duran also called Efodi) and then reached an apex in the fifteenth century, in Castile and Catalonia (Asher Crescas, Yitzḥaq ibn Shem Tov, Yitzḥaq Abravanel). During the same period, several commentaries were written by Arab-speaking Jews, especially in Yemen.

Maimonides established, on the one hand, what will be considered the fundamental topics of the subsequent Jewish thought up until the modern era, and, on the other, he inspired the methods to approach them.

Virtually all later authors, no matter whether in accordance with his stance or dissociating themselves from it, or even harshly criticizing it, will refer to Maimonides, whom they name *ha-Moreh* after the title of his chief work because they consider him as the master par excellence.

Even among the cabalists, a priori far from being keen on Maimonidean rationalism, his prestige and influence were profound. Avraham Abulafia (1240–after 1291) was clearly inspired by certain aspects of Maimonides' thought when developing what has been defined as "ecstatic and prophetic qabbalah," and the question that generations of cabalists have been asking themselves

was: if the *qabbalah* represents the authentic Jewish doctrine, which stems from Sinai's revelation, why a master of Maimonides' stature does not even mention it? There is a variety of answers in this regard: there is even an account of his late conversion to *qabbalah*.

Maimonides' work unfolds in accordance with the tenets of Aristotelianism as transmitted through Arabic philosophic literature: it shares with it a common background in logic, psychology, physics, cosmology, and metaphysics. In accordance with what his Muslim contemporaries thought, Aristotle was considered by Maimonides as the quintessential philosopher, the one who represented the highest point that could ever be reached by human intellect. The Bible and the Aristotelian philosophy, according to Maimonides, agree on essential matters, which they express through different languages. In this light, it is understandable why, during the age of the reorganization of Jewish thought (from the second half of the sixteenth century until the middle of the eighteenth century) following the decline of Aristotelianism, Maimonides' work goes through a period of relative eclipse.

During this period, the thought of Yehuda ha-Levi (1075–1141), which expressed suspicion toward philosophical rationalism but also toward certain forms of Neoplatonism and especially toward the *qabbalah* in its various versions, constituted the main theological and philosophical benchmarks of the Jewish world. But, although the centrality of the Maimonidean thought declined, its prestige remained unscathed: the *Moreh* continued to be studied, quoted, and even translated (by the Italian Yedidiyah Rimini, at the end of the sixteenth century: *Erudizione de' confusi*, the first vernacular translation after the Spanish one, in the early fifteenth century), and Maimonides' dogmatic theology (as defined in other works of his) continued to be considered an essential, even "popular," touchstone for Jews belonging to different communities; Moshe Ḥayyim Luzzatto (1707–1746), a cabalist of systematic spirit, explicitly referred to Maimonides several times throughout his work.

The same can be said of the status of Maimonides as a juridical authority. Although in the

course of the sixteenth century the importance of his summa *Mishneh Torah* declined as a source of authority in the Italian Jewish communities, the book continued to be studied, as its many editions of this period attest.

The new printing of the *Moreh* (1742, near Dessau, Germany), occurred after an over-two-century-long gap (the previous publication was in Sabbioneta, Italy, 1553, which followed the printing in Rome, before 1480), ushered in a new phase of the reception of Maimonides' philosophical work, which took place mainly within the Ashkenazi world, i.e., in Germany and Poland.

An important author of the stature of Moses Mendelssohn, for instance, was clearly inspired by Maimonides in his philosophical articulation between revelation and reason/Jewish particular and human universal. Salomon Maimon (1753–1800), the philosopher critic of Kant, composed a commentary on the *Guide* (*Givath ha-moreh*). For the *maskilim*, the Jewish scholars who aimed at achieving the traditional Jewish knowledge through modern culture, Maimonides inherently represented an example to be followed, due to his harmonization of religion and science. Within the range of historical and philological research, which begins with the nineteenth-century *Wissenschaft des Judentums* and spans until the contemporary university practices, the quantity of studies on Maimonides is incomparably greater than the number of studies on other authors.

In more recent years, a great number of biographies, monographs, reading guides, conference papers, and articles have been published in numerous languages.

Also in the Christian world, the reception of Maimonides has been significant, especially when taking into account the widespread suspicion toward the Jewish culture.

We will see how, during the Renaissance, various Christian thinkers and scholars read, translated, and made use of vast sections of Maimonides' works – of both philosophical and juridical nature – and expressed a positive judgment on them. The *Moreh* had already been translated into Latin toward the middle of the thirteenth century (with the title *Dux neutrorum*), and it had

been explicitly used by authors of the stature of Albertus Magnus and Thomas Aquinas.

It is important here to mention how, for Baruch (Bento, Benedictus) Spinoza, one of the first “modern” authors, who voluntarily kept himself far from any religious creed, Maimonides constituted an essential reference point. On the one hand, Spinoza harshly criticized him, but, on the other, he adopted some of his basic assumptions – such as the one regarding prophecy and the relation between imagination and intellect – adapting them to his own system.

Maimonides in the Renaissance Within the Context of the Jewish Culture

Aspects of Maimonides' Work That Have Been Used in Various Manners

Before being a philosopher, Maimonides was a jurist, one of the most important ones throughout the history of Jewish religious jurisprudence. In his *Mishneh Torah*, written in Hebrew, he gathered the vast array of juridical Talmudic material, and, in a more complete and radical manner compared to his predecessors, he gave it an order. Actually, the *Mishneh Torah* aimed at replacing the Talmud for those who did not possess the skills to study it – an attitude for which he was harshly criticized. In accordance with what was customary during the Almohad era, Maimonides started his juridical code with a section dedicated to the “rules of belief” (*Hilkhoth De'oth*), of a theological nature, where various subjects that will be dealt with later on in his *The Guide for the Perplexed* were exposed in a “popular” manner.

The ground for the *Mishneh Torah* had already been prepared by a commentary, in Arabic, on the *Mishnah* – the body of laws that constitutes the *Talmud*'s own starting point. Also in this text, there are some sections of a philosophical character, dealing in particular with the conduct that man should follow as well as with the destiny of the intellectual soul after physical death.

His philosophical opus magnum, i.e., his *The Guide for the Perplexed*, is a complex work that, stemming from an absolute condemnation of

anthropomorphism – the conception of God as endowed with physical, psychological, or moral characteristics typical of the human being – deals with a great number of topics in a deliberately nonsystematic manner, leaving them also, in some cases, purposely unfinished.

The juridical component of Maimonides' work has been of great significance not only for all generations of Jews but also for the Christian Hebraists from the sixteenth to the seventeenth century and beyond; as for its philosophical component, it has generated a variety of conceptions that are rather different from one another. Below, we list some of Maimonides' ideas that were further developed during the age of the Renaissance:

1. Philosophy should be intended for an intellectual elite in possession of scientific knowledge, besides the religious one, as well as speculative capabilities. The mere expert of religious law (a simple Talmudist with no scientific education) has no access to "the king's palace," i.e., to the knowledge of God, in the limits within which such knowledge is attainable.
2. There is a reason behind every divine commandment since it would be absurd to think that God can issue nonsensical orders. When read correctly (i.e., allegorically), the *Torah* contains the truths of physics and metaphysics, while in its outward and literal aspect, it contains several useful precepts of individual good conduct as well as rules for the correct functioning of society.
3. Some commandments, particularly the ones related to the sacrifices at the Temple of Jerusalem, have a historical/educational purpose. Idolatrous peoples were accustomed to offering sacrifices to their gods in any place: by limiting and focusing the sacrificial practice only in one place, God meant to educate the Jews in unitary worship. Since the highest service of God lies in the knowledge of Him and this, on its ultimate level, coincides with silent meditation, sacrifices implicitly represent only one stage in the development of divine worship.
4. "One serves God to the extent to which one comprehends Him," writes Maimonides in his *Guide*. This intellectualistic stance entails an

outcome that is mystical in nature. The man who raises himself intellectually is able to reach the level of the love of God, a passionate love (*hesheq* in Hebrew, *'ishq* in Arabic) which allows him to passively detach himself from any bodily or worldly bonds. Moses, prophet and philosopher par excellence, died by the "kiss of God," i.e., the union between his own individual intellect and the divine agent intellect.

Maimonides in the Time of Averroism

From the end of the fifteenth century and throughout several decades of the sixteenth century, Averroes became an essential author for Christian thought. His importance is due to his philosophical writings as well as his commentaries on Aristotle which, at that time, were considered the essential framework for understanding the thought of the Stagirite. Averroes' work, however, had to face also plenty of opponents, who pointed out the dangerous and potentially heretical nature of what was called a "twofold path" to reach the truth, the path of reason and the one of faith (or that of revelation or prophecy). This traditional theory of the "twofold path to the truth" might also lead to a theory of the "twofold truth": a concept credited to the Arab philosopher, not without stretching the interpretation of his thought. The Jews had been early readers of Averroes: they systematically translated his writings into Hebrew, and, in some cases, they were directly inspired by the Arab thinker when formulating the theory of a "double path" that can become that of a "double truth," giving more relevance to the path of reason than to that of revelation. Thanks to such an exceptional knowledge of Averroes' work, the Jewish scholars were an outstanding channel for the dissemination of his thought throughout the Latin-Christian world between the end of the fifteenth and the first decades of the sixteenth century, by means of translating (from Hebrew into Latin) his original writings.

The distinctive trait of the "Jewish Averroism" of that period, as well as of earlier periods, is that it largely developed within a Maimonidean frame of reference. The most prominent figure who

represents this trend is **Elijah** del Medigo from Crete (ca. 1455–1492/1493), a scholar who was close to relevant personalities such as Giovanni Pico della Mirandola and Domenico Grimani, author of philosophical writings in Latin and Hebrew as well as of several translations of Averroes. His treatise *Behinath ha-dath* (*The Examination of Religion*) analyzed the fundamental issues of religion from a rational point of view. This brief writing owed much to ibn Rushd's *Fasl al-maqāl* (*The Decisive Treatise*) and contained whole excerpts from the latter. Del Medigo shows an "Averroist" approach when it comes to his sharp distinction between the recipients for whom the revealed scriptures are meant and those who are capable of reading philosophical texts. Maimonides too had conceived such a distinction; however, he had also postulated the identity of contents between philosophy and revealed scripture, whose "secrets" are disclosed by religious reading. Del Medigo openly criticized such a position that remains halfway between theology and philosophy: even though both the *Torah* and philosophy agree in their conclusions – as happens in almost all cases – the two paths should be kept distinct from one another to avoid a situation whereby the former would depend from the latter, which could lead to erroneous results. In spite of this strong critique, Maimonides, the "excellent man," is nonetheless justified by del Medigo, and his doctrines are clearly followed by him, when it comes to the radical negation of divine anthropomorphism and the ceremonial prescriptions of the *Torah* as a means for the enhancement of the soul (through the expression of correct opinions) as well as of the body (through the proper functioning of society). Therefore, the divine commandments do have a purpose; "otherwise they would be like the actions of a madman, which are purposeless," as del Medigo wrote, paraphrasing Maimonides. In light of this, it can be said that the most important Jewish Averroist of the Renaissance was also a Maimonidean, notwithstanding some important distinctions. Indeed, it would have appeared impossible for a Jewish philosopher not to refer to the writings and the solutions of the "great eagle," as Maimonides was called, as the true glory of Jewish thought.

On the other hand, it is interesting to note how, throughout the works of an author who may be considered the last exponent of the Jewish medieval thought, 'Ovadia Sforza (1475?–1550), basically there is no mention whatsoever of Maimonides, even when he approaches certain subjects that would evidently lend themselves to it. This important biblical commentator and philosopher, who lived in Rome and Bologna and was one of Johannes Reuchlin's teachers of Hebrew, wrote a philosophical work in Hebrew, *Or 'Ammym* (Bologna 1537), which he translated himself into Latin with several amendments (*Lumen Gentium*, 1548) and which deals with fundamental metaphysical and theological topics. If, on the one hand, this work shows a dialectical structure (it analyzes two opposite theses with their respective rationales, and then both of them are contested and a synthesis is found), on the other hand, the content of the book is influenced by an approach that is characteristic of the Renaissance: the world, according to Sforza, has been created for a purpose and man is the ultimate purpose of creation. Maimonides, who had denied such finalism, is here criticized without being explicitly referred to. What is most surprising is that, apart from Aristotle, Sforza's main point of reference is Averroes, whose commentaries and writings are mentioned with great frequency, even when resorting to Maimonides would have been obvious for a Jewish author: as is the case with the discussion about the relation between God's knowledge and human knowledge, which are mere "homonyms," i.e., they have nothing in common but the name and are totally different in their essence.

This book was meant to demonstrate to the Jews as well as to the non-Jews that the idea of election of the former is rational in character. As Sforza writes, the Jews are possessors, through the *Torah*, of a set of philosophical truths, and it is their mission to spread them to the world. Probably it wouldn't have been appropriate to support his demonstrations by quoting another Jewish author, who could have been considered non-convincing and dismissed as biased.

However, notwithstanding the almost complete absence of Maimonides in Sforza's

pages, which makes him a philosopher who is perfectly in line with the Averroistic tendency of his time, the rationalistic structure of the *Lumen Gentium* is undoubtedly of Maimonidean inspiration.

This is most apparent in his description of the fundamental relation between knowledge and love/fear of God but also in some sections clearly inspired by the *Guide* (even though the latter is never mentioned), for instance, the chapter about the origin of evil. According to Sforza as well as to Maimonides, one can love and fear God in a manner that is directly proportional to the knowledge of Him; true faith derives from knowledge: without the latter, faith ceases to be an act of free will and is, therefore, impossible.

Maimonides in the Time of Neoplatonism

Even among those Jewish thinkers of the Renaissance who lean toward Neoplatonism, the influence of Maimonides' teachings is present, especially, but not only, for what concerns the aspiration to union with the Divine that constitutes the highest level of human existence. The most interesting example is that of Yehudah Abravanel (Spain, ca.1465; Italy, ca.1523), known in the Christian world as Leo Hebraeus or Leone Ebreo, who blended in a unique manner in his *Dialoghi d'amore* (*Dialogues of Love*) Neoplatonic, cabalistic, and Maimonidean motives. The worship of God, according to both Leo and Maimonides, reaches its apex in the activity of intellectual love which, through the union with the Divine, grants the worshipper's soul with immortality. As far as other aspects are concerned, Leone is inspired by Maimonides but comes to different conclusions. Leone Ebreo paraphrased Maimonides when exposing several possible theories about the creation of the world, but then he opted in favor of a solution – the attribution of forms to matter, like in Plato's conception – that differs from the creation *ex nihilo* as indicated by Maimonides. In his *Guide* (3.8), Maimonides had compared matter to an adulterous woman: just as the latter is in constant need of a man and, being unfaithful, she keeps on changing partner, so matter, which cannot exist without form, keeps on moving, getting rid of one form to take up another

one. By using this simile, Maimonides meant to highlight the unstable nature of matter and its essential condition of deprivation. Leo literally resorted to the same simile, but he did so in order to exalt the beauty of mundane creation, which presents a wonderful variety of forms. This shift from a "medieval" view, characterized by an intellectualistic and negative approach toward matter, to a Renaissance approach, whereby aesthetics play a pivotal role and matter reflects the beauty that radiates throughout the universe, is also apparent in their two different conceptions of imagination. According to Maimonides' thought – as well as that of other contemporary or previous Islamic thinkers – this human capacity has a negative value: the original sin determined the fall of man from the world of certainty, in which the option is either true or false, to a world where man can only choose between good and evil, beauty and hideousness, that is the sphere of opinions. According to him, the faculty of imagination is pretty much developed among the prophets – although this is not the case with the most important among them, Moses "the philosopher," who does not need it – as it is necessary in order to transform the communications from the divine world into perceivable, intelligible data; this is the only way in which the masses of nonphilosophers will be able to comprehend a higher plane of reality. On the contrary, according to Leone, imagination is that faculty that allows man to comprehend the intellectual beauty of the cosmos, a systematic whole whose binding agent is exactly the universal beauty.

The perception of beauty – the aesthetics – therefore becomes in Leone Ebreo the path that leads to man's elevation toward God and no longer the only way forward for those who are not capable of elaborating intellectual concepts purified from material impurities.

The intellectual path of union with God – that *amor dei intellectualis* which will, later on, represent, for Spinoza, the goal man should strive for – has also been a central theme in the works of later and less-known Jewish authors.

In around 1575, the Italian rabbi Lazzaro da Viterbo from Rome (in Hebrew: Eliezer Matzliaḥ ha-Kohen) wrote a work in Latin with the title

Tractatus de Anno Jubilaei, addressed to Pope Gregory XIII on the occasion of the Jubilee proclaimed by the latter pontiff. Lazzaro, in his writing, goes back to the Jewish origin of the institution of the Jubilee, pointing out its intellectual and spiritual value. The true liberation – which the biblical liberation of slaves on a 50-year basis alludes to – is the liberation of the senses, such that the soul can rise to the sublime heights of divinity. The commandments of the Bible, according to Lazzaro, encourage man to engage in speculation about the most elevated intellectual subjects. By getting inspiration from the process performed by Moses, man should enhance his knowledge, which is the only means through which one can aspire to enter into conjunction with the Divine.

From this brief description, it can be seen that the Jewish thinkers of the Renaissance, those of Averroistic tendency as well as those of Neoplatonic inspiration, referred to Maimonides by utilizing different aspects of his thought: the centrality of the intellectual activity and the “outward” ceremonial laws, considered as being instrumental in achieving the true happiness of society, the separation between the ordinary public and the philosophers, and the conjunction with God as a result of such activity; furthermore, one can find some other common fundamental notions – such as the dogmatic theology – and matters of great importance, such as the issue of evil.

The centrality of Maimonides is confirmed by the writings of one of his most popular critics, the Spaniard Yitzḥaq Abravanel (1437–1508), Yehudah’s father. Yitzḥaq, one of the most prestigious biblical commentators and thinkers of his time, openly criticized Maimonides on many aspects of his philosophical work and particularly regarding his (fundamental) conception of prophecy. For Maimonides, the prophet must be a philosopher, and, moreover, he must possess a strong imagination in order to receive and communicate to the wider public those intellectual notions that are objects of the prophecy. According to Abravanel, such an interpretation is, first of all, violence done to the literal meaning of the biblical text: it is unheard of that the prophets were

philosophers and, on the other hand, no great philosopher has ever been a prophet. Prophecy and philosophy follow two different paths, the former characterized by an intuitive and “a priori” nature and the latter by a consequential, “a posteriori” approach. Prophecy depends on God’s will and addresses everyone; it does not entail a philosophical training of those who communicate it nor of those who receive it. Although he distanced himself from Maimonides in this respect, Abravanel conceived a great deal of his work as a development of Maimonides’ positions, which constantly and explicitly constitute his starting point as well as his frame of reference.

Another important Spanish author, Yitzḥaq Arama (ca. 1420–1494), whose sermons collected under the title *‘Aqedath Yitzḥaq* had a deep influence on the Jewish culture of the fifteenth century, built his religious, anti-intellectualistic vision of the relationship between reason and revelation on Maimonides’ conceptions systematically refuted.

Other well-known Spanish authors, like Avraham Bibago (ca. 1420–1488/1489) and Avraham Shalom (d. 1492), though not sharing the extreme rationalistic position of Maimonides, consider him the absolute reference of Jewish religious thought, defend him against his philosophical adversaries, and see themselves as his disciples.

The Use of Maimonides’ Rationalism in the Conflict with *qabbalah*

As a consequence of the gradual change of the intellectual reference points in different fields of knowledge – such as in the fields of physics, cosmology, and logic – also Maimonideanism, which depended on such reference points, suffered from a relative decline within the Jewish culture. The *Guide* continued to be read, studied, and even translated, but there aren’t in this period any intellectual elaborations that are fully or even partly based on Maimonides’ thought.

In Safed, an important center for the production of cabalistic literature, Maimonides was worshipped mainly as the great codifier of Jewish jurisprudence. Yosef Caro (1488–1575) with his

famous *Shulhan 'arukh* aimed at creating a new *Mishneh Torah*: as if he were “Maimonides redivivus,” Yosef Caro considered himself an authority capable of unifying the religious laws of the various Jewish communities, and his attitude betrayed Messianic ambitions.

During the seventeenth century, *qabbalah* took on the role of dominant cultural stream within the Jewish world, filling the void left by the crisis of philosophy. However, the rise of *qabbalah* was opposed by some intellectuals of rationalistic inspiration. One of these is the Italian polymath Leone (Yehudah Aryeh) Modena (1571–1648), who attacked the “new” cabalistic culture by stemming from Maimonides’ work, which enjoyed undisputed prestige in all streams of the Jewish thought.

In his *Ary Nohem* (A Roaring Lion), the Venetian rabbi addressed his disciple Yosef Hamitz, who was moving away from the rationalistic orientation in order to embrace *qabbalah*. Modena and Hamitz had read the *Guide* together, and it is actually through the *Guide* that some crucial points of the Jewish esoteric doctrine are criticized. First of all, the cabalists state that the revealed doctrine cannot be subject to discussions or, least of all, demonstrations, while Maimonides had clearly indicated, right at the end of his *Guide*, that the truths transmitted by prophetic means can and should be studied through the use of reason: thus, *qabbalah*, according to Modena, is far from being a science. Furthermore, the cabalists state that their doctrine represents the true Jewish esoteric tradition, i.e., the *Sitrei Torah* (Secrets of the Torah), even though it is clear that, as categorically stated by Maimonides, such secrets went lost due to the exile and decadence of the Jewish people. There is no other way but to try to reconstruct, by means of reason, those lost truths – as Maimonides himself tried to do – and in any case, the association of the *qabbalah* with those truths would be arrogant and untruthful.

Modena is neither an Averroist nor a Neoplatonist: he does not point out the possibility of double truth, as the former do, nor does he think of the conjunction with the divinity as the final scope of intellectual activity, as held by the latter.

His rationalism is moderate in nature, and it aims at finding reasons behind the data of revelation, in which he believes, avoiding any sort of irrational dogmatism. His opposition to *qabbalah* stems from an outlook on Judaism as a revealed religion that is also rational or, at least, reasonable. Therefore, Maimonideanism characterizes itself – in this period as well as later on – both as a call to reasonableness and the refusal of a form of religion that exalts an undisputable tradition, minimizing the value of science.

Maimonides in the Renaissance Within the Context of the Christian Culture

Maimonides from the Viewpoint of “Christian Cabalists”

Also, some important Christian cabalists read Maimonides’ philosophical work and used it for their own theoretical elaborations. Giovanni Pico della Mirandola (1463–1494) considered Maimonides a cabalist, but this judgment depends on the presentation of the doctrine of the cabalist Avraham Abulafia made by Pico’s translator, Flavius Mithridates.

The important humanist and “Christian cabalist” Johann Reuchlin (1455–1522) has probably been the first Christian reader of *The Guide for the Perplexed* in its Hebrew version. He quotes from this book explicitly and implicitly in several works of his, not only of cabalistic nature; but it is *De arte cabalistica* (1517) which contains a great number of references to the *Guide*, in several contexts: the doctrine of creation as emanation, the theory of knowledge as union between passive (i.e., human) and active (i.e., divine) intellect, and the criticism of magic and theurgy. Maimonides is often – even if not always – quoted by Reuchlin not under his name but, anonymously, as a cabalist and as such as a representative of the philosophia perennis, in contrast with the Talmudists. We can speak, in the case of Reuchlin’s reading, of Maimonides in a cabalistic and Neoplatonic garb.

However, Maimonides’ presence is even more relevant in the theological conception of

Paulus Ricius (1480–1541), a converted Jew from Trento who spent his life between Italy and Germany.

In his *Sal foederis* (1507) and *Statuta prudentum* (1530), Ricius refers to the Maimonidean idea of Jewish ceremonial laws (the *mitzwoth*) considering them as guidelines issued by the divine wisdom for the sake of keeping man away from idolatry, but then he goes further, postulating that such laws should now be considered as obsolete – and this was something that Maimonides, of course, had never written – and should be replaced by moral laws which are eternally engraved in the human reason: these are, according to him, the “Secrets of the Torah” which the philosopher from Cordova repeatedly alluded to and which should now be disclosed, since humanity is mature enough to understand their truth. Christianity embodies and conveys such eternal rational laws that coincide with *qabbalah*, the philosophical core of esoteric Judaism as well as the archaic tradition of philosophical Christianity.

If it is true that rational and spiritual Christianity transcends Judaism, the latter, on the other hand, presents an important aspect that the true religion, founded upon the love of God as well as the intention of the believer irrespective of his ritual practices, should preserve: the aversion to images. Also, in this case, Ricius follows Maimonides: images might have been helpful to those men who were not capable of conceptual capacity in getting them to formulate some religious notions; however, their function, just as that of the commandments, has a merely historical value. Therefore, authentic Christianity, for Ricius, is a philosophical religion, indifferent to the positive commandments, and without images (this latter position led his critics to accuse him of being protestant and iconoclast). The thirteen fundamental beliefs of Judaism as enunciated by Maimonides, according to Ricius, can be accepted without reserve by the Christians, apart from the one relating to Messianism, which after all will start being omitted in the dogmatic prescriptions of later Jewish authors.

The philosophic inspiration of religion as postulated by Maimonides and his outlook on

the ceremonial laws as conducive to the intellectual activity and, in some cases, with a historical and pedagogical function, all contributed to the inspiration of this “Christian cabalist.” Maimonides’ work provided him with the prerequisites for the formulation of a universal and rational religion, which might probably be seen as the trigger of his conversion to Christianity.

Maimonides’ Work as an Outstanding Means to Access Jewish Thought and Jurisprudence

A Latin translation (from the Hebrew version) of *The Guide for the Perplexed* (titled *Dux neutrorum*) existed from the middle of the thirteenth century (around the year 1240), and it had provided some of the protagonists of Scholasticism, such as Albertus Magnus and Thomas Aquinas, with important philosophical topics of reflection.

In the context of a new interest in the Jewish culture during the Renaissance, the abovementioned version was printed, in 1520 in Paris, by the humanist and Hebraist Agostino Giustiniani, a Dominican, bishop of Nebbio (Corsica), and editor of an important polyglot *Psalterium*.

Giustiniani published this text with the title *Dux seu director dubitantium aut perplexorum*, affirming that in it “many philosophical reasons that lead to the comprehension of the Sacred Scripture are exposed and demonstrated.” The author’s great merit, according to Giustiniani, lies in not being “superstitious” at all but, on the contrary, in being sincere and truth-loving, unlike most more recent Jewish authors.

One century later, when Hebraic studies in the Christian world had reached a phase of maturity, Johannes Buxtorf II published a new Latin version of the Hebrew text of the *Guide*, with the title *Doctor perplexorum* (Basel, 1629). The praise for Maimonides in his book was motivated by the same reasons as Giustiniani’s, which are taken further by Buxtorf: according to the latter, this Jewish author is far from the “Talmudic fables, on the contrary he warns us against wasting too much time studying the *Talmud*”

(which was far from the real intentions of Maimonides who, as a great Talmudist, had simply criticized the study of the *Talmud* when not associated to the study of the sciences and philosophy). Maimonides, according to Buxtorf, had gotten his ideas “from the scripture, from philosophy and from sound reason” and was different, in all respects, from his coreligionists, who were devoted to cabalistic and Talmudic superstitions.

The translator admitted that some of the ideas contained in this book were contrary to the principles of the Christian religion; nonetheless, as a true humanist-philologist, he did not want to censure them: “I didn’t want to castrate the author.”

Other prestigious Hebraists, such as Josephus Scaliger and Isaac Casaubon, admired the *Guide*, which they defined as “a divine work,” “which one cannot praise enough, rich in good ideas and extremely useful to Christian theology.” In reality, notwithstanding the admiration aroused in its Christian readers, the reading of the *Guide* played a more important role in disseminating knowledge about the Jewish religious thought rather than in stimulating any original reflections – apart from the examples mentioned in the previous paragraph.

The Latin translations of Maimonides’ theological and juridical writings were actually of great importance for the comprehension of the Jewish culture. Such translations were done in the sixteenth and seventeenth centuries and beyond, mostly in Calvinist and Lutheran contexts, up until the eighteenth century.

One of the most important sixteenth-century Hebraists, the German Sebastian Münster, published in Basel in 1527 the translation of Shemuel ibn Tibbon’s Hebrew version of Maimonides’ *Logic*, i.e., the *Logica Sapientis Rabbi Simeonis* (sic) and then, 2 years later, in Worms, the *Tredecim Articuli Fidei Judaeorum*, extracted from the Hebrew translation of the commentary on the *Mishnah*. The latter articles were approached again in 1569 by the French Gilbert Genebrard, who translated the *Laws Concerning Kings* (*Hilkhoth melahim* 1572) from the *Mishneh Torah*, as well as the list of 613 commandments (1584). These commandments had already

been translated by Paulus Ricius in his *Opuscula Varia* (1515). At a later stage, the *Mishneh Torah* – a cornerstone book of any Jewish library – became the text privileged by Latino-Christian translators.

Especially in the Netherlands, during the eighteenth century, some parts of the *Mishneh Torah* were translated, in particular, *Hilkhoth Avodah Zarah* (Dionysius Vossius, *De Idolatria...*), *Hilkhoth Yesodey ha-Torah* (Guglielmus Vorstius, *Constitutiones de Fundamentis Legis*, Amsterdam 1638), and the opening section of this work, which is of a theological nature, i.e., the *Hilkhoth De’oth* (Georgius Gentius, *Canones Ethici*).

All the abovementioned translations were performed by the disciples of the rabbi of Amsterdam Menasseh ben Israel, who played a role in mediation between the Jewish culture and the Christian one. Such mediation revolved – once again – around the work of Maimonides, who was considered, essentially, the main codifier of the Jewish jurisprudence.

Thanks to the richness and complexity of his work, rabbi Moses ben Maimon has not only prompted reflection among the Jews, which is evident in the variety of commentaries throughout the Renaissance as well as at the beginning of the modern era but also within the Christian culture: through his works as a theologian and jurist, he allowed the Christians to get to know and better appreciate the thought and rules of life of their Jewish neighbors.

Abstract

This article is a short biography of the Italian Renaissance physician and philosopher Giovanni Mainardi (Ferrara 1462–1536). The article includes the following sections: biography, heritage and rupture with the tradition, innovative and original aspects, and impact and legacy. The latest section of the article is the bibliography, which includes the bibliographical references and some other bibliographical data.

Mainardi was a professor of medicine at the Studium of Ferrara; he also practiced medicine at the court of Buda in Hungary, as a physician to kings Ladislas II and Ludovicus, and at the court of Ferrara, as a physician to the d'Este family, namely to Cardinal Ippolito d'Este and Duke Alfonso I.

The medical works by Mainardi are not numerous. Nevertheless, Mainardi left an important legacy to subsequent physicians. He participated in a famous dispute on French pox, demonstrating that astrology is not necessary in order to explain the origins and transmission of the disease. But his major contributions to medical knowledge are his letters, which inaugurated a new way of writing on medicine, as well as a new style both in reasoning and in medical practice. Mainardi also worked on pharmacy and medical diagnosis, correcting what he deemed the many errors contained in medieval pharmacology and in Medieval and Renaissance commentaries on Galen's *Ars parva*.

Biography

Giovanni Mainardi (Fig. 1) was born in Ferrara, on the 24th of February 1462; his first name was Giovanni Giacomo. He studied at the Studium of Ferrara, where he graduated *in artibus et medicina* on the 17th of October 1482 (Mugnai Carrara 2006). At the Studium of Ferrara, Mainardi studied *studia humanitatis* with Battista Guarino and medicine with Francesco Benzi, and maybe also with Palmarino Anguissola (Mugnai Carrara 2006; Mugnai Carrara 2005). Secondary literature discusses Mainardi's scholarship with the famous humanist physician Niccolò Leonicensi (1428–1524). Nevertheless, during a lesson on Galen's *Ars parva* (1546–1547), the humanist physician Giambattista Da Monte (1498–1551) spoke of Mainardi, saying that he had been Leonicensi's pupil (Monte ms n. 1760, 14r–v).

After a period of teaching at the Studium of Ferrara, in 1493 Mainardi moved to Mirandola, where he was the personal physician of Gianfrancesco Pico (1469–1533), the nephew of

Giovanni Pico. As Mugnai Carrara states, Mainardi was Pico's teacher of philosophy, and probably also had diplomatic tasks. One of the most important outcomes of Mainardi's collaboration with Gianfrancesco Pico is the posthumous publication of the latter's *Disputationes adversus astrologiam divinatricem* (Pico 1496) (Fig. 2).

During his stay in Mirandola (1493–1502), Mainardi participated in a quarrel about the origin of the *morbus Gallicus*, the French pox, i.e., syphilis. In 1502, Mainardi moved to Carpi and Ferrara. As one can grasp from his own writings, Mainardi taught at the Studium of Ferrara between ca. 1507 and 1513, when he left Ferrara to move to Hungary. There, he became the personal physician of King Ladislas II and, after his death, of his brother, Ludovicus (Mugnai Carrara 2006). Before 1518, Mainardi's son, Timoteo, who had become a physician in 1514, joined his father in Buda. During his stay in Hungary, Mainardi worked on the publication of his commentary on the first book of Galen's *Ars parva*, where he collected the results of his previous teachings at the University of Ferrara and which was first published in Rome in 1525 (Mainardi 1525). He also worked on his first book of medical letters (books I–VI), which were eventually published in Ferrara in 1521.

Back in Ferrara in 1518, Mainardi's reputation of being a brilliant physician was evidenced by his presence in Ariosto's *Orlando Furioso* (Fig. 3). Mainardi practiced medicine at Este's family court, as a physician to the Cardinal Ippolito d'Este and Duke Alfonso I. He was also appointed first professor of medicine at the University of Ferrara, where he died on the 7th March 1536.

Heritage and Rupture with the Tradition

In 1501, Mainardi published his first work. In fact, in 1500 Mainardi entered the quarrel on the origins of the French pox, which started in 1496 at the University of Lipsia. The main actors were Simon Pistoris and Martin Pollich von Mellerstadt: the dispute was about the influence of the stars on the origins and transmission of the disease. According to Pollich, the disease was

related to the corruption of the air (Pollich 1496, 43); on the contrary, Pistoris believed the disease originated from the astrological influence of the stars (Pistoris 1498, 129–130). In his works, Pistoris attacked Pollich and also Leonicensio, who had published his *De epidemia* in 1497,

where he had stated that French pox was an epidemic disease originated that from corrupted air and humors (Leonicensio 1497, d3r). In 1500, Mainardi wrote a letter against Pistoris, where he attacked astrological medicine, since, as Giovanni Pico had shown, medicine must be cleared from

astrology. Mainardi explained that the medical methods of diagnosis and therapy are not based on astrology: Hippocrates and Avicenna did not use astrology in their medicine (Mainardi 1501; Zambelli 1965). This letter became the first of the second book of *Epistolae medicinales*, first published in 1521 (Mainardi 1521, II 1, 9v–16v).

Mainardi's medical letters were very successful. The first volume was published again in 1528

(Mainardi 1528) and in 1529 (Mainardi 1529; this edition is quite well known because Erasmus participated in the diffusion of the text). The second volume of letters, books VII–XII, was first published in Bologna in 1531 (Mainardi 1531), then in Lyon in 1532 (Mainardi 1532). François Rabelais (1494–1553) edited this text, dedicating the volume to the jurist André Tiraqueau (Céard 2006). In 1535, the last edition was published in

Basel, when Mainardi was still alive (Mainardi 1535a). Eighteen books of letters were contained in this edition. Many other editions followed during the sixteenth and seventeenth centuries: since the 1540 edition (Mainardi 1540), the books of letters had become 20.

Innovative and Original Aspects

The first letter of the *Epistolae medicales* starts with the vindication of a new way of writing medicine, namely, the epistolary genre (Mainardi 1521, I 1, 1). Mainardi presents himself as a *homo novus* (new man), since writing medical letters is a gesture of opposition to medical authority and tradition, normally based on treatises. This gesture was accompanied by the search for the correction of medical errors in medicine and in the study of nature. According to Mainardi, who was following the scientific and humanistic path of his teacher Leoniceno, these errors were the result of the lack of critical analysis of sources, and of the oblivion of ancient Greek and Latin texts, in favor of Medieval Latin translations and Arabic medicine. Physicians should read “the original” ancient texts by Hippocrates and Galen, that is, they should search for the good lesson from ancient manuscripts and the real object described by ancient texts. Philology becomes a tool of medicine, useful in the inquiry on diseases and body parts, as well as to give the right diagnosis and choose the good therapy.

One of the most important letters in Mainardi’s collection is the celebrated second letter of the seventh book. This deals with diseases of the external parts of the body. It is addressed to the surgeon Michaelis Sanctanna, who, in 1525, asked Mainardi to remove from the scientific milieu the confusion of names of diseases. This confusion, Mainardi says, is due to the illiteracy of the physicians, who do not grasp the names of the diseases. As a matter of fact, physicians do not know exactly the way Greek, Latin, and Arabian physicians called diseases. Consequently, they cannot find the disease they are looking up in the medical literature. At the same time, communication with other physicians and surgeons is

hindered, since there is no agreement on the medical language. A good physician speaks a simple medical language, where the right word matches the right thing. A good physician does not repeat by heart ancient texts, but is able to use them, together with natural philosophy, to search for the cause of the disease (Mainardi 1535a, VII 2, 96–97).

This was one of the most important points in Galenic teaching, as Mainardi knew by his reading of Galen’s *Ars parva*, also known as *Ars medicinalis*. As already said, Mainardi published his commentary on the first book of Galen’s *Ars parva* in 1525. The work was dedicated to his son and dated 1515: Mainardi considered *Ars parva* as a scholarly book of medicine. His commentary is an explanation for his son, who studied medicine and could not follow his father’s teachings on the subject (Mainardi 1525, A2r). *Ars parva* gave physicians the right method to practice medicine, namely a method based on the search for the cause and signs of diseases and things of Nature.

The principles of this new method of practicing medicine by Mainardi were also applied to pharmaceuticals, as showed by his annotations on the works on remedies by Mesue (died 857). Mainardi’s annotations were dated 1521 and were published in the 1535 edition of the medical letters (Mainardi 1535b). As one can read in the preface of the annotations, truth (*veritas*) of medicine and pharmacy can be obtained by explaining unclear passages, developing the too concise texts, filling in omissions as well as correcting errors (Mainardi 1535b, 405).

Impact and Legacy

Giovanni Mainardi’s letters left quite an important legacy to medical practice and literature. During the sixteenth century, as well as during the following centuries, many physicians wrote medical letters on medicine, botany, pharmacy, surgery, and so on, following Mainardi’s (McLean 2008; Siraisi 2013; Van Miert 2013).

Another important legacy of Mainardi’s teaching is the criticism of his predecessors in order to

correct the many errors of medicine. Mainardi showed how to apply philology to medicine, in order to clarify medical literature, and especially to the identification of the meaning of medical works. This search for the good and real meaning of medical words was fundamental, according to Mainardi, in order to allow good communication between physicians, surgeons, and apothecaries, in the interests of patients and medicine itself, as shown by the French translation of the famous medical letters VII 2 (Mainardi 1555).

Abstract

John Mair was a Scottish-born philosopher and theologian who taught at the Universities of Paris, Glasgow, and St. Andrews. He made significant contributions to logic and theology and wrote the first history of Great Britain.

Biography

John Mair was born in Gleghornie, Scotland in 1467. His primary education was in Haddington, and he enrolled in Cambridge University in 1490. He resided in God's House College, later to become Christ's Church. In 1491 or 1492, he enrolled in the Collège Sainte-Barbe at the University of Paris where he earned his licentiate in arts in 1494 and the Master of Arts in 1495. Mair studied the liberal arts under John Bolu, Thomas Briscot, and Gerónimo Pardo and theology under John Standonck and Noël Beda at the Collège de Montaigu. Mair received his doctorate on November 12, 1506 and remained in Paris until 1518, when he returned to Scotland to serve as the principal regent of the University of Glasgow until 1523 at which point he took a position at the University of St. Andrews. He remained there until 1526 when he returned to Paris to teach both logic and theology. Late in 1530 or 1531, Mair returned to Scotland and took a position at St. Andrews serving as provost beginning in 1533. He died on May 1, 1550 [On Mair's life see J.K. Farge in (Slotemaker and Witt 2015), 13–22].

Mair published extensively between 1499 and 1530. The majority of his early works were in logic and published between 1499 and 1508. Between

1509 and 1530, the majority of his publishing was dedicated to his massive theological commentary on the *Sentences* of Peter Lombard. Mair also published several biblical commentaries and a history of Great Britain; he also edited several scholastic treatises, including Adam Wodeham's commentary on the *Sentences* (i.e., his commentary on the *Abbreviatio* of Henry Totting of Oyta), and John Duns Scotus's *Reportatio* on the *Sentences*.

Innovative and Original Aspects

Mair's early logical works are grounded in a nominalist logic that is intimately engaged with works of late medieval scholasticism. Thus, Mair's earliest logical works rely upon an interpretation of Aristotelian philosophy that predominated in the late medieval period in works such as Peter of Spain's *Summulae logicales* (Broadie 1985, 2009). In his later logical works, however, Mair breaks with a strict nominalist approach and begins to rework his logical texts with an eye to Aristotle's texts themselves. In this regard, while it is accurate to consider Mair a nominalist logician, he represents a complicated case given that his nominalist approach is not strictly synonymous with the nominalists of the fourteenth or fifteenth centuries (Slotemaker and Witt 2015, 241–287). Further, Mair often attempts to reconcile the various competing schools of the so-called *Wegestreit* (e.g., the *nominales* and *reales*) as well as a strict scholastic methodology with a humanist informed method. This complicated methodology is found not only in Mair's logical works but is also a significant aspect of his greatest work, his massive commentary on Peter Lombard's *Sentences*.

The first indication that Mair's commentary on the *Sentences* is not a *traditional* work is the introductory dialogue with which Mair begins the 1510 edition of his commentary on book I. Here Mair includes a dialogue – “on the subject matter that should be investigated by a theologian” – between two of his students, Gavin Douglas and David Cranston (Slotemaker and Witt 2015, 25–40). Douglas presents a critique of scholastic method and even quotes the humanist Lorenzo Valla, while Cranston defends

scholasticism. And, what is odd is that the dialogue has no resolution. Mair leaves the question open – his response is his massive commentary that follows. And, while it is easy to read the work as the last dying breath of scholastic theology at the beginning of the sixteenth century, what one realizes is that Mair attempts in this work to seek a *via media* between the various theological positions defended by the nominalists and realists and also the distinct positions and methods of the humanists. In this regard, Mair's massive theological commentary is similar to his late logical works that seek to find some common ground between the various schools of thought. In this respect, Mair is a complex thinker who warrants further study both as a philosopher and a theologian.

Manetti, Giannozzo

Born: 1396, Florence

Died: 1459, Naples

David Marsh

Rutgers School of Arts and Sciences, Rutgers University, New Brunswick, NJ, USA

Abstract

The Florentine merchant and humanist Giannozzo Manetti (1396–1459) combined a successful career as a businessman, civic official, and diplomat with extraordinary intellectual achievements that included a vast library (now in the Vatican), a knowledge of both

classics and Hebrew, and a vast array of compositions in Italian and Latin – orations, treatises, dialogues, and translations of Aristotle, the Psalms, and the New Testament. Like his contemporaries, Manetti principally devoted himself to the field of ethics, from Peripatetic moral tracts to the consolatory literature of the Greeks, and argued for a new positive vision of humankind in stark contrast to the pessimism of medieval thought. Yet he was deeply devout and composed ten books of Christian apology *Adversus Iudaeos et Gentes* [*Against the Jews and Gentiles*], in which he rejects the beliefs and practices of pagan religion and Pentateuchal legislation, and he exalts the teaching of Christ. Together with Lorenzo Valla, he is significant as a precursor of Renaissance philology for his insistence on applying textual criticism to the most “sacred” texts of the Western tradition, Aristotle, and the Bible.

Biography

Giannozzo Manetti (Florence, June 5, 1396, to Naples, October 27, 1459) is one of the most remarkable figures of Florentine humanism in the fifteenth century – an opulent merchant, an active statesman, a profound scholar, a secular philosopher and theologian, and a learned Christian Hebraist. Although we have little record of his extraordinary success in business, his numerous activities both public and private, are amply documented throughout his long career. As an official representative of the Florentine republic, he has left funeral orations for Leonardo Bruni and Giannozzo Pandolfini, as well as a considerable corpus of public speeches in both Latin and Italian. As a humanist scholar, he wrote important dialogues and treatises, including the celebrated *De dignitate et excellentia hominis* [*On Human Worth and Excellence*], which many consider a central manifesto of the new Renaissance philosophy. As a secular philosopher, he undertook the translation (or at least the critical revision) of Aristotle’s ethical treatises; and as a precursor of Protestant theology, he translated the Greek text of the New Testament into Latin. Finally, he

studied and mastered Hebrew, and not only evaluated texts central to the Judeo-Christian tradition but also translated the Psalms into Latin – a layman scholar’s response to the canonic work of St. Jerome.

Born into a wealthy family in the Florentine district of Santo Spirito, Manetti took part in the family business, but also studied philosophy and theology at the Florentine Studium. By 1425, he was a member of the bankers’ guild, and from 1429 until his exile in 1453 he held numerous important public offices both at home and abroad.

Heritage and Rupture with the Tradition

Manetti learned Latin and Greek in circles that encouraged both traditional Aristotelian and humanistic currents, but he also resolved to learn Hebrew, and to that end boarded converted Jews in his household. In contrast to Leonardo Bruni, in many respects his role model, who rejected the study of Hebrew as unimportant, Manetti believed that the “errors” of the Jews could only be refuted on the basis of the Old Testament read in the original Hebrew.

As a humanist thinker, Manetti employed three characteristic genres: the treatise *De dignitate et excellentia hominis* [*On Human Worth and Excellence*], 1450–1452, dedicated to Alphonse of Aragon; *Adversus Iudaeos et Gentes* [*Against the Jews and Gentiles*], 1448–1458; the neo-Ciceronian dialogue (*Dialogus consolatorius de morte filii* [*Consolatory Dialogue*], 1438; *Dialogo consolatorio* [*Consolatory Dialogue*], 1439 [in Italian]; *Dialogus in symposio* [*Banquet Dialogue*], 1448), and biography (*Vitae Socratis et Seneca* [*Lives of Socrates and Seneca*], 1441; *Vitae Dantis, Francisci Petrarchae, Ioannis Boccacii* [*Lives of Dante, Petrarch, and Boccaccio*]; *De vita ac gestis Nicolai Quinti summi pontificis*, 1455 [*Life and Deeds of Pope Nicholas V*]).

Innovative and Original Aspects

While many of Manetti’s writings appear to be merely ambitious compilations, there are a few currents of original thought. Based on his

knowledge of Aristotle and Cicero, he offers surveys of ancient Greek philosophy in two works. Book 1 of *Adversus Iudaeos et Gentes* offers a fairly detailed account of ancient philosophy. By contrast, there are briefer comments on classical thought in *De dignitate et excellentia hominis*, whose title is drawn from a phrase in Cicero’s *De officiis* [*On Duties*] 1.107 – “hominis excellentia et dignitas” [man’s excellence and dignity] – which presumably translates a concept found in the Stoic philosopher Panaetius, the principal model for the Roman treatise (Cancik 2002, 20). Both treatises add a new dimension to humanist thought by adducing insights from the Jewish tradition. Manetti writes as the first Christian apologist of the Renaissance to study Hebrew and the Judaic tradition. In this, he is the first to insist on a trilingual basis for humanist learning and piety: Latin, Greek, and Hebrew.

Composed at the request of Alfonso of Aragon, the humanist king of Naples, Manetti’s most famous work was written in response to two Latin works on the human condition (edition in Manetti 1975). The proximate cause was a treatise dedicated in 1450 to Pope Nicholas V by Bartolomeo Facio (c.1400–1457), *De excellentia ac praestantia hominis* [*On the Excellence and Eminence of Man*]. Facio in turn had been inspired by a work on the same topic dedicated to him by Antonio da Barga, prior of the great Olivetan convent in Naples, in which Manetti would be buried in 1459. But a more authoritative, if more remote, provocation was furnished by the quintessentially medieval treatise *De miseria humane conditionis* [*On the Misery of the Human Condition*] written by the Roman nobleman and cardinal Lotario dei Conti di Segni, who later became Pope Innocent III (1198–1216). This powerful cleric had composed a tract to curb mankind’s propensity to sins like pride and avarice, but he had also proposed to write a complementary treatise on the dignity of the human condition, a work that was presumably forestalled by the author’s subsequent promotion and its attendant duties.

In replying to Lotario dei Segni, Manetti situates his treatise in an ongoing dialogue of humanists across the centuries. As Oliver Glaap has shown, there is a succession of Renaissance responses to the *De miseria*. About a century

and a half later, Petrarch refuted the cleric's arguments in his *De remediis utriusque fortune* (*On the Remedies for Good and Bad Fortune*) (ca. 1360). In *De remediis* 2.93, titled "De tristitia et miseria" (*On Sadness and Misery*), Petrarch advances two arguments against *De miseria*. First, he redefines wretchedness as a mental condition subject to the individual's control. Second, he chops logic and discounts our present earthly suffering by stressing future heavenly bliss. In 1447, the Olivetan monk Antonio da Barga, long resident at San Miniato al Monte in Florence and a friend of Manetti, wrote an epistle to Bartolomeo Facio, a humanist from La Spezia in Liguria who served at the court of Alfonso of Aragon in Naples. Having read Innocent's treatise, Antonio entreated Facio to compose the complementary work promised by the medieval cleric – a treatise on the dignity of man – and outlined the topics that the humanist might employ: he recommends Cicero and Lactantius for their celebration of the human body and, like Petrarch, stresses the joys of the afterlife – enumerated as 12 blessings and 6 joys.

In the event, Facio composed a work along these lines, which he dedicated to Pope Nicholas V. Without citing Antonio da Barga, Facio offers a series of arguments on human excellence that rely on Christian beliefs: man created in the image and likeness of God, the immortality of the soul, and the benefits enjoyed by blessed souls in heaven. Among his friends, Manetti counted Antonio da Barga – as well as Nicholas V – and he was perhaps distressed at Facio's failure to cite the Olivetan monk in his treatise. Alfonso of Aragon may well have wondered why his official historiographer had dedicated his work to the Pope rather than to his Neapolitan patron. In any event, Alfonso asked Manetti to compose his own treatise on the subject.

As noted above, in selecting the title for his work, Manetti adopted a phrase found in Cicero's *De officiis*. He also cites the *locus classicus* of Ovid's *Metamorphoses* 1.84–86, which exalts man for his upright stature and gaze – verses quoted earlier by Petrarch in his *Remedia* (Glaap 1994, 68, 124). The fame and fortune of the work are not hard to explain. In the Renaissance, it was the only work by Manetti to be published in print, in an edition that appeared in Basel in 1532

(Basileae, apud Andream Cratandrum, Anno MDXXXII). In the twentieth century, the work's fourth book was printed in the influential anthology of Eugenio Garin, *Prosatori latini del Quattrocento* [*Latin Prose of the Quattrocento*] (1952), no doubt because it offered an exemplary humanistic refutation of the medieval conception of humankind offered in Lotario dei Segni's *De miseria*.

In Book 1, Manetti writes about the human body, celebrating its wonderful structure in passages that echo Cicero and Lactantius – authors who had been endorsed by Antonio da Barga. According to Christoph Dröge, Manetti's treatise is indebted to Lorenzo Valla's dialogue *De vero bono* [*On the True Good*], both for its appeal to the legitimacy of man's natural instincts and for its rejection of damnation as a primary ethical motivation (Dröge 1987, 108, 110). In Book 2, Manetti discusses the human soul – its divine creation in God's image and its excellence. To the divine aspects of the soul, Manetti adds the humanistic achievements of man's mental abilities, and extols his intelligence, memory, and will (Trinkaus 1970, 242). As evidence of man's creative intelligence, he adduces arts such as navigation from the Argonauts to recent Portuguese explorers, architecture and building from Noah to Brunelleschi, and art from the antiquities named by Pliny to the contemporary goldsmith Lorenzo Ghiberti. In a lengthy catalogue of human arts and sciences, Manetti also praises poetry, the humanities, jurisprudence, medicine, astrology, and theology (Dröge 1987, 112–115). Book 3 begins by discussing the relation between man's body and soul, a topic treated by Antonio da Barga early in his tract. While acknowledging concepts found in Aristotle and Cicero, Manetti attributes human existence to God's plan for the world. Manetti next describes man's admirable gifts – beauty, ingenuity, and wisdom – and portrays humankind as creators who share the divine nature of their Creator. Like Augustine, Manetti suggests that the pagan gods were merely the divinely inspired inventors of useful arts, a thesis that strikingly anticipates the Enlightenment views of Giambattista Vico's *Scienza nuova* (*The New Science*) (1725–1744). Manetti insists on the anthropocentric nature of the world: all things were

created for humankind, an assertion that echoes Paul “omnia enim vestra sunt” (“all things are yours”) (1 Cor. 3:22–23; cf. Trinkaus 1970, 247). Man’s function is to act and understand (*agere et intelligere*, echoing Cicero, *De finibus* [*On Moral Ends*] 2.40). Book 4, which reads as a sort of afterthought, offers a methodical rebuttal of Lotario Segni’s *De miseria*. Manetti’s arguments are drawn from a wide range of sources: the writings of Aristotle and Cicero, the Bible (with comments on the Hebrew of the Old Testament), and the Hermetic corpus. Paradoxically, while Manetti today suffers from a reputation for orthodoxy, he made his name by advancing ideas that often ran counter to contemporary ecclesiastical thought, as Pico della Mirandola would later do in his *De dignitate et excellentia hominis* [*On Human Worth and Excellence*], and in 1583 Manetti’s treatise was placed on the Index of Prohibited Books.

Impact and Legacy

Initially, Manetti’s influence seemed limited in Florence to a few admirers like Donato Acciaiuoli and Vespasiano da Bisticci. There were exceptions. In his *Italia Illustrata* [*Italy Illuminated*], dedicated to Pope Nicholas V in 1453, Biondo Flavio included Manetti (who had just joined the Curia) among the illustrious Tuscans of his day (Biondo 2005, 74: “Ianoctus Manectus, litterarum Graecarum Latinarumque peritia atque eloquentia... patriam exorna[n]t” [Giannozzo Manetti honored his homeland by his learning and elquence in Greek and Latin letters]). Later, the Spanish nobleman Nuño de Guzmán, whom the humanist had befriended during the Council of Florence, made a Castilian version of Manetti’s 1453 oration for Sigismondo Pandolfo Malatesta (Lawrance 1989, 193–228). Next, the Florentine Cristoforo Landino paid tribute to Manetti in his Italian commentary on Dante’s *Commedia* (Landino 1974, 1:130):

Et hoggi vivono non pochi, e quali o già perfecti o no, o nel corso che guida ad perfectione tanto progressi, che saranno in gran nome ne’ futuri secoli appresso di quegli che dopo noi verranno.

Optimo phisico et methaphisico, et in tre lingue externe docto vedemo ne’ tempi nostri Iannoctio Manetto. Traduxe di greco. Traduxe d’hebreo non pochi libri, et molto utili. Scripse chose morali et naturali.

[Today there live many men who have either attained perfection or are so advanced on the way to perfections that they will enjoy renown in the future generations that come after us. In our time, we witnessed in Giannozzo Manetti an excellent student of physics and metaphysics, who was learned in three foreign languages. He translated several books from Greek and Hebrew that were very useful, and wrote about ethics and natural science.]

In his 1490 dialogue *De hominibus doctis* (*On Learned Men*), Paolo Cortesi praised Manetti together with Leon Battista Alberti, but wondered why Manetti was not celebrated as much as he deserved (Cortesi 1973, 32):

Sed multum duo doctrina praestiterunt Jannotius Manettius et Baptista Albertus, quorum alter unus omnium doctissimum putabatur, alter etiam in architectura disertus fuit. Sed in Jannotio admirabile quoddam stadium omnium doctrinarum fuit; sed nescio quo pacto sit huius summi viri quam aliorum paulo ante dictorum nomen obscurius.

[In learning, two men stood out by far – Giannozzo Manetti and Battista Alberti. The former was considered the most learned of all, while the latter was also eloquent in the field of architecture. Now, Giannozzo possessed an amazing passion for all fields of learning, but for some reason the reputation of this great man is more obscure than that of others I have mentioned.]

In the field of scriptural studies, John Monfasani characterizes Manetti as “in fact, if not in influence, a more revolutionary biblical scholar than Valla” (Monfasani 2008, 30). As for his philosophical works, none circulated widely, although Manetti’s concept of human dignity seems to have influenced Pérez de Oliva (1492–1533) in Spain and Pierre Boiastuau (c. 1520–1566) in France (Schmeisser 2006). But after the treatise was placed on the Index of Prohibited Books in Spain in 1583, the censure was extended in 1590 in all Catholic lands, presumably because of its attacks on Pope Innocent III. In the early 1600s, German scholars, perhaps moved by his funeral oration on Leonardo Bruni, printed a few of Manetti’s Latin orations (Dröge 1998).

Meanwhile, in the mid-sixteenth century, the humanist’s vast library of Latin, Greek, and

Hebrew manuscripts was acquired piecemeal after 1529 by the rich merchant Ulrich Fugger of Augsburg. The collection then passed to Heidelberg, and following the conquest of that city in 1623, it was transferred to the Vatican Library in the so-called Palatine *fondi* that took their name from the Elector who ruled Heidelberg.

In the nineteenth century, Georg Voigt dedicated only some five pages to a summary biography of Manetti (Voigt 1893, 1:322–326) but elsewhere noted his presence and production throughout an illustrious career.

Mantino ben Samuel, Jacob

Born: Late fifteenth century, Tortosa?

Died: 1549, Damascus

Charles Burnett

The Warburg Institute, School of Advanced Study, University of London, London, UK

Abstract

Jacob Mantino was one of the most important Jews in the sixteenth century who spent his life working for Christian patrons, teaching in Christian institutions, and translating philosophical and medical texts in Latin for the advancement of those subjects among his Christian, Latin-reading, audience. His key role was in providing clear and up-to-date translations of the principal Arabic/Islamic authorities on philosophy and medicine, Averroes and Avicenna.

Biography

Jacob Mantino's parents originated from Tortosa in Spain, where he may have been born. He states that he studied medicine and possibly the arts at the University of Padua. He practiced as a doctor in Bologna and became an intimate of Pope Leo X, to whom he dedicated a translation of the Middle Commentary on Aristotle's *On Animals* in 1521. In the same year, he dedicated his translation of the Compendium (Epitome) of Aristotle's *Metaphysics* to another patron, Ercole Gonzaga, bishop of Mantua. This marks the beginning of a lifetime devoted to the translation of Averroes (both his philosophical commentaries and his medical work, the *Colliget*) and Avicenna. At the time of the Fall of Rome (1527), Mantino moved

to Verona, where he continued to be held in high esteem. The new pope, Clement VII, consulted him concerning Henry VIII's appeal to Rome concerning the legality of his marriage to Catherine, in which Mantino quoted the Hebrew Bible and the Talmud to claim that Henry should not have divorced his queen (Katz). Mantino returned to Rome to be the personal physician of Pope Paul III (Alessandro Farnese; 1534–1549). At the same time, he played an important role in the Jewish community there and taught at La Sapienza University. He was consulted by Jews on legal matters and showed off his linguistic knowledge by deriving the pope's name from Etruscan, which he claimed was the same as Syriac, in which "pharnes" means "shepherd." In 1544 Mantino left Rome to return to Venice. Several documents survive which renew the permission given to him to wear the black beret of the scholar rather than the yellow Jewish cap, although he continued to live in the Jewish ghetto there. Already when he was in Bologna, he had shown an interest in learning Arabic. He obtained the collaboration of Leo Africanus (al-Hasan al-Wazzan) to draw up an Arabic vocabulary for which he started to find the equivalents in Hebrew and Latin (Davis). In 1549 he arranged to accompany the Venetian ambassador to Damascus, as his doctor, in pursuit of Arabic texts. But, unfortunately, he died soon after he arrived.

In the preface to his translation of Averroes's Epitome on the *Physics*, Mantino promised Ercole Gonzaga that, when he had finished translating a collection of medical works (first the *Colliget* of Averroes and then the paraphrases of several works of Galen, made by Iohannitius – Hunayn ibn Ishaq), he would "obtain all those commentaries of Averroes which are in the Hebrew language and, with God's leadership, and your favour, translate them into the Latin idiom." His motivation for doing this was that the earlier translations into Latin (usually directly from Arabic) were written in such a barbarous style that they were impossible to understand, and people blamed Averroes for doctrines that he did not hold. When the Giunta brothers undertook to publish "all the works of Aristotle with all the commentaries on those works that have come down to

us” in Venice in 1550, they mentioned, already on the title page in capital letters, that “some of these <commentaries>, having never been seen by the Latins before, have recently been translated by Jacob Mantino, while others have been more clearly and faithfully translated by him than ever before.” The fact that the editors could only include the first four books of the Middle Commentary on the *Topics* is an indication that this was as far as Mantino could reach before he died in Damascus. Both Mantino and his admirers emphasize the clarity of his Latin translations, in spite of their having been written by a Jew. Sometimes he only translated the most important and/or controversial parts of works, such as the 3rd and 56th chapter of Averroes’s commentary on the third book of Aristotle’s *On the Soul*, which propose the unity of the possible intellect, and the three parts (“fen”) of the *Canon of Medicine* of Avicenna that were most studied in the schools of medicine. Mantino regarded Aristotle as being indisputably the greatest philosopher but it was not possible to understand Aristotle without his commentator Averroes. Hence, it was very necessary to present Averroes’s words correctly. Similarly, Avicenna was “first in renown among the Arabs in the art of medicine” (Mantino did not pay attention to Avicenna’s philosophical works) and, again, had to be understood correctly. In turn, in a Jewish document from Rome, Mantino is called “the prince of the physicians”, and the editor of the 1562 printing of the Giunta edition of Aristotle-Averroes calls his translation “golden” (“aurea translatio”: vol. I, fol. 319r). In addition to translating works by Aristotle and Averroes, he translated an ethical work by Maimonides (*Eight Chapters on Ethics* dedicated to Guido Rangoni) as well as the “supercommentaries” on Averroes’s Middle Commentaries on Aristotelian logic by Levi ben Gerson.

Significance

Unlike other Jews of the Renaissance, Mantino, as far as we know, did not write works in Hebrew for his coreligionists. His significance is that he was consulted by Christian scholars as a repository of Jewish learning and as someone who could reveal to Latin readers the works of

Arabic/Islamic authorities in philosophy and medicine that had been preserved in Hebrew translations, as well as to improve, through these same Hebrew sources, the existing Latin translations of these Arabic texts. He was held in the greatest esteem by Christian scholars, for the study of Averroes in particular. His translations held a key position in the interpretation of Averroes of the mid- to late-sixteenth century, at a time when Averroes’s interpretation of Aristotle was most in vogue.

Manuel II Palaeologus

Born: Constantinople, 27 June 1350

Died: Constantinople, 21 July 1425

Charalambos Dendrinos

Hellenic Institute, Royal Holloway University of London, Egham, Surrey, UK

Abstract

Manuel II Palaeologus was one of the most learned and distinguished emperors of Byzantium. An enlightened statesman and a skilled diplomat, Manuel reigned in a critical period for the Empire (1391–1425) when its unity and survival were threatened by internal divisions and external menaces. His cautious policy towards the union of the Churches was dictated by the political realities and his own experiences. Under constant pressure, Manuel found solace in his studies. Surrounded by a circle of scholars and theologians, time and official duties permitting, he pursued his interests in literature and theology. Humane ruler and a thinker in the eyes of his contemporaries, Manuel embodied the ideal of the Platonic philosopher-king.

Biography

Manuel was the second son of Emperor John V Palaeologus (1341–1376, 1379–1391) and Empress Helena Cantacuzene (1333–1396), the

youngest daughter of Emperor John VI Cantacuzenus (1347–1354). Having received his early education from his learned mother, Manuel was subsequently taught by Demetrius Cydones (ca. 1324–ca. 1398), to whom he repeatedly expressed his respect and admiration. Unable to devote himself entirely to his studies, however, as he had to be trained in various skills and disciplines proper to a young prince, Manuel considered his early education inadequate. The civil war that followed the usurpation of the throne by his elder brother Andronicus IV Palaeologus (1376–1379) prevented Manuel from continuing his studies. His imprisonment, together with his father and younger brother Theodore, by Andronicus in the tower of Anemas in Constantinople (1376–1379), where Andronicus and his son John VII (1390) had been previously incarcerated by John V (1373), proved instrumental in this respect, for it allowed him to concentrate on his studies. Despite his inadequate progress, due to the absence of proper guidance and instruction by a teacher under the circumstances, Manuel was animated by a passion for learning that was to last for the rest of his life.

Following John V's restoration and recognition of Andronicus IV as the legitimate successor, Manuel ruled as a despot in Thessalonica (1382). There he established his own court, which included friends who shared his own cultural and literary interests. Adopting an independent stance towards the Ottomans, Manuel initially managed to restore some territories to the Empire. In response, the city of Thessalonica was besieged by Murad I's (1362–1389) general, Hayreddin Pasha. It was in this period (1383–1386) that Manuel wrote his first rhetorical work, the *Counsel to the Thessalonians when they were besieged* (Συμβουλευτικὸς πρὸς τοὺς Θεσσαλονικεῖς ἡνίκα ἐπολιορκοῦντο) urging them to resist the enemy and fight for freedom. His failure to secure help from Venice and Pope Urban VI (1378–1389) resulted in the fall of the city (1387). Banned by his father to the island of Lemnos (1387–1389), with his future uncertain, Manuel found once more refuge in his studies. After his reconciliation with John V, Manuel succeeded him on the imperial throne (1391).

Compelled to accompany Murad I's successor, Bayezid I (1389–1402), as his vassal in the Ottoman campaign in Asia Minor, Manuel spent the early winter of 1391 in the vicinity of Ankara. There he met a Muslim Sufi teacher (possibly Hacı Bayram Velî [1352–1430]), with whom he held a series of conversations on Christianity and Islam. These Manuel later elaborated in his first major theological work, his lengthy *Dialogues with the Persian* (Διάλογος ὃν ἐποιήσατο μετὰ τινος Πέρσου τὴν ἀξίαν Μοντερίζη ἐν Ἀγκύρᾳ τῆς Γαλατίας . . .), in which he discusses primarily the conflicting beliefs of Islam and Christianity. Manuel's love for theology became a source of criticism by an anonymous person (most probably the Latinophrone teacher and theologian Manuel Calecas [d. 1410]), on the grounds that he had not received proper theological and philosophical training and that his official duties hardly allowed him to seriously study theology. Manuel responded to these criticisms in his long *Epistolary discourse on theology addressed to Alexius Iagoup* (Τῷ κυρῷ Ἀλεξίῳ τῷ Ἰαγούπ). Though Manuel acknowledged these facts, he stressed that for him they are not sufficient reasons to abstain from discussing theological subjects, provided that one is aware of the proper use and limits of philosophical reasoning in investigating divine truths, a view that reflects the dominant stance among certain Orthodox circles towards Western scholasticism. In addition, his position as emperor made it his duty to study theology in order to defend the Orthodox doctrines and the Church, which gave him also the right to intervene, when necessary, in ecclesiastical affairs. Manuel's determination to exercise his imperial authority and privileges over the Church, whose jurisdiction extended to Orthodox lands well beyond Byzantine imperial territory, did not remain unchallenged.

Manuel's theological pursuits and involvement in Church affairs were combined with his negotiations with the papacy over the Church union. After the defeat of the Christian coalition by the Ottomans at Nicopolis (1396) and with Constantinople being under siege (1394–1402), Manuel approached the Roman Pope Boniface IX (1389–1404), who issued a bull (1398) urging the Christian potentates to offer military aid. The

expedition led by the French Marshal Jean le Meingre, also known as Boucicaut (1366–1421), in 1399 had limited success. Boucicaut convinced Manuel that the only way to attract serious attention of Western monarchs to his cause would be by personally visiting them at their courts in Europe. After he appointed Andronicus' son, John VII, as his regent in Constantinople, Manuel sailed to Venice in December 1399, stopping at the Morea, where he left his wife and children for safety with his brother Theodore. At that point, he had already started composing his *Precepts on the Education of an Emperor* (Ὑποθήκαι βασιλικῆς ἀγωγῆς), which he reworked during and after his voyage to the West. This work, composed as a *royal speech* in the form of a hundred chapters, epitomizes Manuel's vision of statesmanship and the virtuous ruler. He subsequently elaborated on the major themes in his *Seven Ethico-political Orations*, Manuel's moral testament, which expounds on the principles and virtues that lead man closer to God and to true happiness. Both these works are addressed to John VIII, foregrounding Manuel's concern for the legitimacy of his son's succession to the throne.

From Venice, Manuel crossed Italy, through Padua, Vicenza, Pavia, and Milan, where he was cordially received by the Duke Gian Galeazzo Visconti (1351–1402). There Manuel was joined by Manuel Chrysoloras (1355–1415), his close friend, scholar, and ambassador, who had been teaching Greek in Florence. The Emperor continued to Paris where he was ceremoniously received by King Charles VI (1380–1422) and his court in the presence of the people of Paris (3 June 1400). A description of the royal reception and the deep impression Manuel made is recorded by the anonymous Religious of Saint Denys. During his stay in Paris, Manuel resided at the old louver, where, inspired by a dyed woven hanging tapestry representing scenes of Spring, he composed a short prose work, the *Depiction of Spring in a Dyed, Woven Hanging* (Ἐαρος εἰκὼν ἐν ὑφαντῷ παραπετάσματι ῥηγικῷ), which differs from similar Byzantine *ekphraseis* of Spring, showing an appreciation of art as an image of reality and life. At the same time, Manuel continued his diplomatic contacts and negotiations with other

Western potentates through his ambassadors, who travelled to Margaret I, Queen of Denmark, Sweden and Norway (1387–1412), as well as to King Martin I of Aragon (1396–1410), King Henry III of Castile (1390–1406), and King Charles III of Navarre (1387–1404). Manuel also personally visited King Henry IV (1399–1413) in England (December 1400–mid-February 1401), whose kindness and generous hospitality were much appreciated by the Emperor, though his assurances for financial and military assistance, which raised Manuel's hopes, were never materialized.

During his sojourn in Paris, Manuel was also presented with a theological tract by an anonymous Latin theologian, most probably a Benedictine, which defended the Latin doctrine of the procession of the Holy Spirit from the Father and the Son in the form of a syllogism (Λατίνου τινὸς ἀσκοῦντος ἐν τοῖς προαστείοις τοῦ Παρυσίου, πρὸς τὸν αὐτοκράτορα Ρωμαίων Μανουὴλ τὸν Παλαιολόγον, ἀπόδημον ὄντα ἐν ταῖς Γαλίαις, ἐν σχήματι συλλογισμοῦ κεφαλαιώδης ἐπιτομὴ περὶ τῆς τοῦ ἁγίου Πνεύματος ἐκπορεύσεως). Manuel responded by composing a lengthy treatise *On the Procession of the Holy Spirit* (Τοῦ αὐτοκράτορος τῶν Ρωμαίων Μανουὴλ τοῦ Παλαιολόγου πρὸς ταῦτα λόγος ἀπολογητικός), in which he refuted the Latin views on the *Filioque* by presenting the Orthodox teachings on the procession of the Holy Spirit, in the sense of the eternal hypostatic emanation, from the Father alone. Manuel expounded on the Orthodox perception of the Trinity, stressing the unique and unconfused attributes of the three consubstantial hypostases, the distinction between the divine essence and the divine energy, the different terms and prepositions used by the saints to denote the eternal emanation and the temporal manifestation of the Holy Spirit, and finally examining the question over the nature of the primacy of the Bishop of Rome. The treatise is appended by a short discourse *On the Order in the Trinity* (Ὅτι ὑπὲρ τάξιν ἡ Τριάς, καὶ τὸ θεῖον ἀσημάτιστον, καὶ οὐκ ἐκ τῶν ἡμετέρων ἢ ἐν αὐτῇ τάξις δεικνύται πραγμάτων τε καὶ παραδειγμάτων), in which Manuel provides further arguments in defense of the Orthodox views

on the procession of the Holy Spirit. Through his own studies and his close association with eminent theologians, notably Joseph Bryennius (1340/50–1431), Nicholas Cabasilas (1319/23–1392) and Demetrius Cydones, Manuel was well acquainted with the Greek and Latin teachings. Albeit not original in his approach and argumentation, Manuel proved himself a competent theologian, showing a profound understanding of the main issues that lie behind the doctrinal and ecclesiastical divergence between the two traditions, and expressed his wish for union, under certain conditions.

Comments in the treatise *On the Procession of the Holy Spirit* show that Manuel was informed of the controversies within the Latin Church and events concerning the Western Schism at the time, namely, the rivalry between the Pope in Rome and the Pope in Avignon, and their efforts to secure the allegiance of cardinals and sovereigns, as well as the dispute between the Dominicans and the Franciscans over the doctrine of the Immaculate Conception. Manuel contacted Pope Benedict XIII (1394–1423) at Avignon and probably visited Pope Boniface IX in Rome in person. It is possible that these diplomatic contacts were sanctioned by Charles VI, who was eager to convene a general council which would put an end to the Western Schism (1378–1418). According to Macarius Metropolitan of Ancyra (1397–1405), who accompanied Manuel on his journey, the Emperor held discussions also with representatives of King Charles on the prospects of an ecumenical council to end the Schism between the Greek and the Latin Churches. Manuel seems to have provisionally consented to this plan, in order to promote his cause. His cautious attitude towards Church union, however, is reflected in the personal advice he gave to John VIII (1425–1448), during the negotiations with the papacy in 1422, which was recorded by the courtier and historian George Sphrantzes (1401–ca. 1477) who was present at this meeting. Aware of the political complexities, Manuel advised his son always to discuss union with the Latins to keep the Ottomans at bay, but never bring it about for this would widen the division in the Byzantine Church and society thus exposing the Empire to the Ottomans. His

judgment, which was not duly appreciated by his son, proved wise in the end, as the union proclaimed later on in Florence under John VIII (1439) was short-lived and never truly materialized in the face of the strong opposition of the Orthodox Church and people.

Meanwhile, the defeat of the Ottoman army and the imprisonment of Bayezid by Timur (1370–1405) in the battle of Ankara (28 July 1402) were considered a God-sent by Manuel, who composed two short rhetorical works, a hymn in the form of a Psalm on the occasion of Bayezid's defeat, and an *ethopoiea*, a fictional address by Timur to Bayezid. Leaving Paris (23 November 1402), Manuel traveled to Genoa, possibly Florence, and Ferrara and reached Venice (March 1403). From there, he sailed to the Morea, where he rejoined his family and returned to Constantinople (June 1403).

Before he left for the West, Manuel commissioned the copying of the works he had composed thus far. This edition is preserved in codex *Parisinus graecus* 3041. Paleographical and codicological evidence shows that apart from the works that Manuel had written before he left Constantinople (1399), this manuscript contains, in addition, several other works he wrote during his stay in the West and after his return to Constantinople, including his selected correspondence (dated prior to 1417), added to the manuscript at a later stage. Some of these works remain unpublished. More importantly, the manuscript bears extensive revisions by the hand of the Emperor in several works, including Manuel's *Moral dialogue with the Empress-Mother or On marriage* (*Διάλογος πρὸς τὴν κυρίαν αὐτοῦ καὶ δέσποιναν καὶ μητέρα, ἢ περὶ γάμου*), composed after his marriage in 1392 with the Serbian princess Helena Dragaš (b. 1372–d. 1450), which reflects the uncertainty over dynastic succession in the early years of his reign (1394–1396/7).

Manuel's habit of revising his own writings, many of which were copied by his chief scribe Isidore of Kiev (1385–1463), and sending drafts to members of his literary circle before publication is attested in a number of his works, including his treatise *On the Procession of the Holy Spirit*, sections of which were revised by the

theologian Macarius Macres (1382/3–1431), the *Confession addressed to his spiritual father on the occasion of his own recovery from a serious illness* (Πρὸς τὸν ἑαυτοῦ πνευματικόν, ὑπὲρ τῶν καθ' ἑαυτὸν μετὰ τὸ ραῖσαι τῆς δεινῶς κατασκηψάσης αὐτῷ χαλεπωτάτης νόσου), a draft of which was presented in Thessalonica to the monks David and Damian of Vatopedi, and his *Funeral Oration on his Brother Theodore* (Λόγος ἐπιτάφιος εἰς τὸν αὐτάδελφον αὐτοῦ δεσπότην πορφυρογέννητον κῦριν Θεόδωρον Παλαιολόγον ῥηθεὶς ἐπιδημήσαντος εἰς Πελοπόννησον τοῦ βασιλέως), which was revised several times. Composed on the occasion of Theodore I's death (24 June 1407), apart from its literary value, reflecting Manuel's elegance of style and sensitivity, the *Funeral Oration* is an important historical source of Byzantine policy in the Morea under Theodore. The lengthy epitaph is preceded by a number of *protheoriae*, among which one by the philosopher George Gemistos (Plethon) (1355–1452), who later presented Manuel with a *Memorandum* expressing his proposals in response to the political and socio-economic crisis in the Peloponnese and the Empire at the time (1418). The *Funeral Oration* was subsequently sent with an accompanying letter to Manuel Chrysoloras, in which the Emperor requested his friend to make changes and revisions. Chrysoloras responded with a long epistolary discourse (which survives in the autograph manuscript Meteora, Monastery of Transfiguration, cod. 154), praising the Emperor for this composition and urging him to continue his patronage of education, expressing his concern for Greek literature being neglected in Byzantium while studied by Italian humanists. Similarly, a version of the *Funeral Oration* was sent to Manuel Chrysoloras' humanist disciples Guarino dei Guarini of Verona (1374–1460), who was requested by the Emperor to translate it into Latin or Italian, and Ambrosio Traversari (1386–1439). Guarino was the first humanist to travel to Constantinople to learn Greek. After his return to Italy, he taught Greek in Florence, Venice, Verona, and Ferrara and played an important role in humanist circles. His fellow Florentine Camaldolese scholar and theologian Ambrosio

Traversari shared Guarino's love for Greek language and tradition, translated a number of classical and patristic Greek works, and took an active part in the negotiations over the union of the Churches, which he fervently supported. Another Italian humanist, Rinuccio d'Arezzo (1395–1459), dedicated his translation of Plato's *Crito* to the Emperor.

Information about Manuel's intellectual pursuits and activities is included in his correspondence with scholars and theologians, including his mentor Demetrius Cydones, Manuel Chrysoloras, the theologian Demetrius Chrysoloras (ca. 1360–post 1440), the mystic Nicholas Cabasilas, and others, with some of whom he collaborated on joint projects, for example, Isidore Glabas Metropolitan of Thessalonica (1397–1418), with whom he co-operated over the composition of Manuel's sermon *On Sin and Penance* or *On Saint Mary of Egypt* (Λόγος ὅτι ἡ μὲν ἁμαρτία τὸ πάντων χεῖριστον, δεῖ δὲ μηδένα ἀπογινώσκειν ...), and the then priest and later Patriarch of Constantinople Euthymius II (1410–1416), who contributed together with Manuel to a clarification on the debate between Demetrius Chrysoloras and Antonio d'Ascoli (Σαφηνεῖά τις τῶν εἰρημένων ἐξ ἑκατέρου τῶν ἤδη διαλεχθέντων ...) on the philosophical question *If it is better to be than not to be, how could Christ say of Judas that it would be better for him if he had never been born?* (cf. Matth. 26:24).

Despite his official duties and pressure, Manuel always found time to pursue his intellectual pursuits, which he resembled as his coach training him for his contest with *Tyche*. His works demonstrate a range of literary interests. Apart from epistolography, ethico-political and philosophical discourses, and theological treatises, he composed homilies *On the Nativity of the Lord*, *On the Dormition of the Mother of God*, *On Saint John the Baptist*; a number of rhetorical works including the *Panegyric on the recovery of his father from illness*, *Declamation on a drunkard*, *Response of Antenor to Odysseus*, *Oration as from a benevolent ruler to his well-disposed subjects in a critical time*, verses, *Sixteen lines in anacreontic verse addressed to a completely ignorant and most garrulous person*; and spiritual compositions,

liturgical canons, prayers and hymns, comprising *Chapters of compunction* or *Prayer before Holy Communion*, *Morning prayers*, and *Prayer for those buffeted by storm or simply at sea adapted from the Psalms*. Some of these works remain hitherto unpublished.

After a stroke that left him partly paralyzed (1422), Manuel retired from active political life having passed on the administration of state affairs to John VIII, and according to the historian Ducas (ca. 1400–post 1462), he devoted his last years in his theological studies. Following the example of his grandfather, John Cantacuzenus, Manuel assumed the monastic habit under the name of Matthew. On 21 July 1425, Manuel died at the age of 75. Monodies and funeral orations were composed and delivered by members of his circle, including Macarius Macres and Bessarion (1403–1472), paying tribute to the remarkable and learned Emperor, who through his life and work embodied the ideal of the Platonic philosopher-king.

Manuscript in Renaissance Philosophy

Abstract

The shift from manuscript to printed book occurred slowly. Renaissance writers preserved a good deal of the format and intellectual habits inherited from the manuscript tradition.

A considerable amount of philosophical work of the fifteenth and sixteenth centuries exists in manuscripts, which contain significant variants and redactions erased by the homogeneity of printed books. Manuscript study clarifies the wider picture of the tastes, intellectual enthusiasms, institutional needs, and diffusion of ideas in the Renaissance period.

Heritage and Rupture Within the Tradition

Western philosophy was given a new dynamic in the fifteenth century by the invention of printing. Nevertheless, the shift from manuscript to book was a gradual one (D'Amico 1988). Printed texts owed much to the form established by manuscript exemplars, and important work continued to be produced and circulated in manuscript form over the sixteenth century. Manuscripts provided an important link between the medieval heritage and the new thinking characteristic of the Renaissance period. Copies of ancient and medieval authors circulated, and new texts were composed, in manuscript form. Important works exist in manuscript by major figures such as Marsilio Ficino, Giovanni Pico della Mirandola, Nicholas of Cusa, Erasmus, and Giordano Bruno (Richardson 2014).

In the early medieval period, the main producer of books was the monastic scriptorium. Monastic libraries were not chiefly intended as repositories of knowledge, but as working resources serving the liturgical and contemplative needs of their communities. Philosophical study, as an activity distinct from spiritual exercises, was not a high priority for monastic institutions, though the mendicant Dominican and Franciscan orders housed substantial collections serving the *studia generalia* in which some philosophical works were preserved.

From the thirteenth century, new means of reaching the growing secular reading public developed: the production of books was centralized in workshops which could provide a diverse range of titles to buyers near cities. Output was

facilitated by improving technologies of paper production. A book dealer like Vespasiano da Bisticci (1421–1498) could call on professional scribes who were able to write in Greek and Hebrew. When printing was introduced, the same workshops produced both manuscripts and printed works, which helps to explain why early printed books copied so closely the format of manuscript work: in philosophical texts, this typically involved a commentary, with an apparatus of glosses, cross-references, indexing, chapter, and paragraph divisions all based on manuscript precedent. Over time, changes to book design and structure emerged: humanist script replaced the Gothic hand, pagination was introduced, and the *oratio* and *praefatio* sections displayed the influence of humanist rhetoric. Printers simplified the complex system of shorthand abbreviations employed by medieval scribes.

Besides commercial book dealers, a principal source for philosophical texts was the university. Philosophy manuscripts reflected the pedagogic need for copies of canonical texts, such as Aristotle, and for commentaries on them, with book design evolving to integrate the two. Commercial stationers or *stationarii* were commissioned to produce sufficient copies for students, using the *pecia* system, whereby texts were broken down into short sections (*peciae*), to be copied by separate scribes. The base texts of printed books can often be traced back to this system, which was used by eleven universities. From these school texts would spread copies of copies, and a second-hand trade created a natural diffusion of books carried by students across Europe. Texts traceable to Oxford have been found in Italy, and conversely, Italian humanist texts have been found in manuscript copies in Spain, England, and Germany. A vigorous pattern of dissemination of ideas was already in existence before the printing revolution (Kristeller 1963–1992).

Impact and Legacy

Different kinds of public and private repositories developed for increasing manuscript production:

by the middle of the fourteenth century, the Sorbonne in Paris had some 2,000 books; in the fifteenth century, important libraries serving individual scholars included San Marco, Venice (functioning by 1444) and the Vatican (operating by 1475), notable for its holdings of Greek texts and Latin translations of Greek. Here, scholars were able to compile *florilegia*, excerpts culled from major works.

From these sources, Renaissance writers produced manuscript work of various kinds. First, and most traditionally, were copies of texts such as Aristotle and his major medieval commentators, Aquinas and Averroes. The primacy of the commentary was a major continuing strand from earlier book production. New works included Greek texts (especially following the fall of Constantinople in 1453) and fresh translations from them: humanist scholars were critical of the scholastic reliance on Latin versions and preferred to return to the original languages in their study of Platonic, Neoplatonic, and other rediscovered texts. They were also, of course, avid collectors of manuscripts (D'Amico 1992).

Other types of manuscript include copies of printed works, necessary when these were only given small print runs. Distinctive instances occur: copies of Machiavelli's *Il Principe* were made after its prohibition, far into the sixteenth century. Authorial drafts, lecture notes, and letters add to the manuscript stock of the Renaissance period (Kristeller 1982). Some technical work involving illustration was beyond the capacities of printing presses and could only be encountered through manuscript. A manuscript might wait for many years before being printed, and even where early printed copies of a work exist, the study of manuscript sources can bring important findings. Early prints tended to use a single base text and eschew collating manuscripts. As a result, important drafts and variants may be overlooked. Kristeller (1976) cites the example of earlier works of Ficino discovered in manuscript, which indicate him to be closer at that period to scholastic habits of thought than was previously realized.

Beyond the elucidation of individual writers and works, a bibliographic study is vital for yielding a full and correct version of the sociology of

philosophical ideas: scholarly study of textual transmission suggests patterns of institutional need, personal taste, coterie cultures, and the circulation of ideas. Kristeller (1976) argues that the field is neglected: historians prefer to study archive material; classicists are less interested in later texts, and literary scholars prefer the study of vernacular and non-technical texts. These objections do not yet seem redundant, with manuscript study of poetry and other nonphilosophical texts still in the ascendant over philosophical manuscripts, where much work remains to be done.

Abstract

Aldus Manutius was perhaps the greatest humanist printer of the Italian Renaissance.

After a professional start as a teacher, he undertook the publication of fine editions of the Greek classics in partnership with Andrea Torresano and Pierfrancesco Barbarigo in Venice. During his years of activity, Aldus produced more first editions in Greek than any competitor. As these texts required a significant commitment of funds and resources, the Greek texts were soon accompanied by the faster-selling Latin and Italian classics. This shift in the business came with the innovative *enchiridia*, Aldus' pocket-size editions, the first series of books proper. Across his printed output, Aldus managed to make an impressive number of innovations, which in turn marked a shift in the reading experience. Many of these (for example, his innovations in the use of punctuation) have had a long-term impact and are still part of how we experience books and reading today.

Biography

Much of the scarce biographical information we have about the life of Aldus Manutius is available through indirect sources, such as the printed dedications he signed in his editions, letters in which he looked back at his earlier life, and accounts compiled by others. Very little documentary evidence remains, especially for the earlier periods. Studies by H. George Fletcher (1988) and Martin Lowry (1979) have made the most of such evidence. Edited primary sources such as the inventory of published and unpublished letters (Pastorello 1957, 1960) and the collective edition of prefaces and dedications by Aldus (Orlandi 1975) constitute a cornerstone for research in the field of Aldine studies, alongside the bibliographical work carried out by Antoine-Augustine Renouard (1834). The study by Martin Davies remains to date the best and most insightful

summary of Aldine scholarship, as well as an excellent first reading for anyone approaching the topic for the first time (Davies 1995); this has recently been revised and expanded for publication in Italian (Davies 2019).

The paucity of documentary evidence, and the clear importance of the material element for our understanding of Aldus and his work have prompted a stream of pioneering studies in bibliography, exploring the materiality of the editions jointly with textual evidence. Some of the best among these are Nicolas Barker's work on the Aldine Greek types (Barker 1992); Conor Fahy's examination of paper evidence (Fahy 1995, 2001, 2005/2006); the work by Neil Harris on the *Hypnerotomachia Poliphili* (Harris 2004, 2006); and the more recent investigation by Randall McLeod into the birth of Aldus' italics (McLeod 2015). The importance of the materiality of Aldine editions, both for edition-specific and copy-specific information, is the reason why so much scholarship in the field also draws upon exhibition catalogues and auction or booksellers' catalogues. The list here would be too long, but many such instances can be found by following up on the bibliographic references at the end of this entry.

Aldus Manutius was born in Bassiano, in the Lazio region, around 1452 (Fletcher 1988). He was a student of Domizio Calderini and Gaspare da Verona in Rome (Lowry 1979); around 1475 he moved to Ferrara, where he became a student of the humanist Battista Guarini. From 1480 onwards, Aldus himself became a teacher, undertaking the tuition of the princes Alberto and Lionello Pio of Carpi. During the 1480s, he developed his own teaching handbooks; his Latin grammar was to undergo several editions throughout Europe in decades to come and was remarkably successful considering the conservative approach of the genre (Jensen 1998). Aldus also cultivated his connections with the great humanists of the day, such as Giovanni Pico della Mirandola (uncle of Alberto and Lionello Pio) and Angelo Poliziano. His relationship with the Pio family was to be an inspiration and a source of patronage for many years, even when Aldus moved to Venice around 1489–1490. After

moving to Venice, Aldus continued to work as a teacher. However, the new circumstances brought him, one may say, to the right place at the right time. His profession exposed him to the frustration of the inadequacies of texts for students. The printing of Greek texts in particular was very underdeveloped at this time, and in this, he must have seen a niche in the marketplace of print. Aldus claims that for some 6 years prior to the beginning of the printing operations, he was busy securing financial backing, editorial support, and good manuscripts (Davies 1995, 2019).

Aldus set up his own press near Sant'Agostino (Fletcher 1988), an established called *Thermae*, but his true success came through partnership. The encounter between Aldus and Andrea Torresano sealed the beginning of a most prolific collaboration for the publication of the great classics. Aldus contributed the concept, Torresano the funds and the physical location for the business, as well as an existing distribution network. As a former employee of Nicolas Jenson, Andrea Torresano had received solid business training (Davies 1995, 2019). A third partner, the Venetian patrician Pierfrancesco Barbarigo, contributed funding worth 50% of the entire venture. Aldus' own financial share, amounting to just 10%, was negligible compared to that of the other two. It is possible that the Pio family may have provided some of these funds; the numerous dedications offered to various members of the family in years to come would seem to support this (Orlandi 1975). In 1505, Aldus further sealed his partnership with the Torresano family by marrying Andrea's daughter, Maria. It was around the time of his marriage that Aldus moved in with the Torresano family in San Paternian, near St Mark's square. During the 10 years of their marriage, Maria bore him 3 sons (Marco Manuzio, Antonio, and Paolo) and 2 daughters (Alda and Letizia).

During the following years, Aldus was occasionally ill; he also travelled much, searching manuscripts for his editions and broadening his network of collaborators and patrons (Lowry 1979). These practical circumstances, followed by a personal incident – Aldus was arrested on the unfounded suspicion of robbery in July 1506, and taken from Asola to Mantua where he was

imprisoned – meant that the printing operations waned in the following couple of years. Nonetheless, we know that this continued to be an exceptionally busy time for Aldus, through the testimony of Erasmus who was to be a guest in the house of Andrea Torresano for nearly a whole year in 1507–1508 (Braidia 2015). This visit culminated with the publication of Erasmus' *Adagia*, produced in a significantly enlarged version than the earlier Parisian edition. This particular venture, prompted at Erasmus' own initiative, is suggestive of the international stature attained by this time by the Aldine press in general, and Aldus in particular.

Erasmus' dialogue *Opulentia sordida* (Braidia 2015) is a colorful account of life at the Aldine press, describing the meagre hospitality of Andrea Torresano but also Aldus' exceptional commitment to his work, and the generous help received by Erasmus from members of the Aldine humanist network in Venice. It seems that Aldus had the ambition to turn this informal network of friends and collaborators – his *Neakademia* – into something more formal and institutionalized. The printed document known as *Lex Neacademiae*, as well as contemporary correspondence, stand witness to this “academic dream” (Lowry 1979; Davies 1995, 2019) and lend the venture more credibility than it has been acknowledged by an eminent scholar like Carlo Dionisotti (1995). While this ambition never quite took shape as Aldus may have wished, the Aldine press certainly did succeed in gathering a cohesive group of similarly minded scholars.

Aldus' later years were marked by difficulties of various sorts. Aldus himself was absent from Venice between 1509 and 1512, during the years of the League of Cambrai. Fears for how his status as a Roman citizen might affect his property in Venice prompted this decision, as well as the compilation of formal documents for the cession of Aldus' own share in the printing venture to Torresano alone, and Aldus' second will. Printing resumed in late 1512 and culminated with the production of the 1513 Plato; other scholarly Greek editions followed in the same years. Despite this last spur of activity, Aldus himself was fatigued by his long labors, and in 1514, he

fell ill again. He made his third and last will in January 1515, and he died on 6 February that year (Fletcher 1988).

Innovative and Original Aspects

In a truly entrepreneurial fashion, Aldus Manutius identified a gap in the market for high-quality editions of the classics. During the 20 years or so of his printing activity, Aldus surpassed all his competitors in producing *editiones principes* of Greek authors (Sandys 1903–1908). Aldus accomplished this by relying on a network of scholars, both for the editorial work in the printing shop and to secure manuscripts to be used as models. He had a keen perception of the importance of this publishing venture, as is demonstrated by the form of the various privileges requested for the protection of intellectual property. Several new typefaces were designed by typesetter Francesco Griffo, including the new Greek font, which could be set with the correct accents and spirits; three more Greeks would follow as part of this collaboration. The document dated 25 February 1496 (*more Veneto*) indicated that the new typeface, “of the utmost beauty,” would allow making substantial earnings by printing text in Greek that will look even better than handwriting; a venture that will be “of the highest honour, gain and use to this great city.” The text requested that the investment should be protected by preventing the publication or the import of books printed in Greek (or translated from Greek) for 20 years (Barker 1992). This document, alongside later privileges (namely the one protecting the Aldine italics), shows how very clearly Aldus understood his predicament – both in the importance and value of his idea, and the danger of its repeatability.

The five-volume Aristotle, published between 1495 and 1498, was the most remarkable and demanding venture among Aldus’ Greek editions. Martin Davies has deservedly defined this “the greatest publishing venture of the fifteenth century,” despite its being incomplete (the *Organon* and some of the philosophical works were present, but the *Rhetoric* and the *Poetics* were still

missing at the time), and the many errors that continued to affect the text (Davies 1995, 2019). Through his extensive work on the Aldine Greek editions, Martin Sicherl determined that the Aristotle and its corollary texts were far from philologically correct, with erroneous readings, silent corrections, and the collation of far fewer manuscripts than the Aldine paratexts would generally seem to indicate (Sicherl 1997). Contemporary scholars were well aware of these problems with the text, and Aldus must have been, too, although, as he declared in the preface to the works of Theophrastus (in fact, the second volume of the 1495–1498 Aristotle), “to have something is better than to have nothing” (Davies 1995, 2019). Aldus’ effort was really aimed at offering a universal companion to Aristotle, as he set out to publish the full canon accompanied by its early Greek commentators, printed as separate editions (Sellars 2004). Aldus himself only managed to publish some Aristotelian commentators, including Ammonius, Johannes Philoponus, and Psellos, while others were issued by his heirs.

As the printing of the first five volumes of Aristotle drew to an end, Aldus and his partners must have realized the urgency of shifting some of the copies to recoup costs. As part of the sale strategies devised to this end, the Aldine press was the first to issue formal retail catalogues to its customers. The first catalogue of Aldine editions was produced in 1498 and featured a lengthy explanation of the Greek texts printed until that point, as well as the retail price for an unbound and unadorned copy. The studies by Orlandi and Dionisotti (Orlandi 1975, Dionisotti 1995) both contain full photographic reproductions of the three Aldine catalogues of 1498, 1503, and 1513, from the Ms Grec 3064 in the French National Library. The complete manuscript is now freely accessible online via Gallica.fr. The Aldine catalogues are also reproduced in the recent volume by Martin Davies and Neil Harris (2019), with the difference that for the 1513 catalogue they reproduce the copy at the Municipal Library in Udine. This copy is pretty much unknown but made particularly important by the presence of contemporary annotations and integrations.

The Greek editions obviously required vast funds and a significant commitment of resources in the round. It soon transpired that these alone would hardly make for a sustainable business. Aldus took on occasional projects on commission, some of which are among his most iconic publications (the *Hypnerotomachia Poliphili*, 1499, is a case in point). But a shift was necessary for the entire business model if the venture was to survive. The Aldine press took to publishing Latin classics and even a few texts in the Italian vernacular, including the works of Petrarch, Dante, and Jacopo Sannazzaro. Most of these texts were produced following a significantly different editorial format: the *enchiridion*, or pocket-size book. Through his collaboration with Griffo, Aldus commissioned the first italic type, designed specifically to suit the smaller octavos. Randall McLeod has shown that this typeface was slowly refined and perfected, in particular by following the use of typographic ligatures to reflect the correct etymology of compound prepositions (McLeod 2015). McLeod's work, focusing on the less visible elements of the printed page such as the ligatures or the blind impressions, is producing groundbreaking results for our understanding of the firm's practices and their ongoing revision processes.

Aldus did not, as it has been claimed by mainstream literature, invent small-format books. He did, however, create the ideal specimen by combining the use of the small format with extra-thin paper and the new italics (Harris 2016a, 2019a). The results were a series of very compact, highly portable books. His *enchiridia* were innovative in using small formats to print classical texts (Infelise 2007), while their traditional form had been the large folio, or the quarto for editions aimed at students. The thin, handy appearance of the volumes made them suitable to be used in a different context than reading at the desk. Like all the Aldine editions, these texts were devoid of commentary and illustrations, privileging instead generous white margins. In rejecting the traditional form of the classical text, surrounded by commentary and glosses, Aldus set up an important typographical model, as well as marking a shift in the history of reading. The Aldine Petrarch

edited by Pietro Bembo (1501) brought about several innovations. For the first time, the new punctuation marks typical of Greek texts were applied to the vernacular. The text used a particularly good manuscript as a model and was corrected by Bembo according to pioneering linguistic theories (Trovato 1991). The Aldine experience was key in building Bembo's future work on the codification of the Italian language, and it was part of his broader program, as was the edition of Dante that followed in 1502. Indeed, the publication of Dante was announced at the end of the Petrarch edition, making the links between the two texts as explicit as they possibly could be.

The introduction of Latin and Italian-language texts into the Aldine output was strongly criticized by some of Aldus' acquaintances and friends, such as Janus Lascaris (Nolhac 1888; Lowry 1979). Nonetheless, the compromise of producing these wider-appealing editions alongside the scholarly Greek texts is in all likelihood what allowed the Aldine venture to stay afloat financially. The lack of Aldine "reprints" of the Greek texts, and their continued availability in the firm's catalogues for the following decades certainly confirms their status as slow-sellers. Many of the Latin and Italian texts, on the other hand, were soon printed again. Despite being prized at the high-end of the market and produced in large print runs, even as high as 3,000 copies (Fletcher 1988), they sold out at a sustained pace. Vergil, Lucan, Valerius Maximus, and Petrarch were all printed at least twice between 1501 and 1515, and often by Aldus' heirs soon after. The second Aldine catalogue appeared in 1503, and it listed the *enchiridia* as separate items. The pocket-size books were advertised for their portability: "*Libelli portatiles in formam enchiridii*," suggesting that the materiality of these volumes was the determining criterion for their marketability (Graheli 2016).

Aldus pioneered paratextual elements for the navigation of the book, for example, the index (Vecce 1998). His innovations in the use of punctuation have been briefly mentioned with regard to the 1501 Petrarch. Aldus made important contributions to the modern use of paragraphematic signs; he introduced the semicolon, and he was

the first to use the comma in Latin and Italian texts as it is still used today (Harris 2016a, 2019a). In the effort to improve legibility, Aldus also established the systematic use of double quotation marks to identify textual quotes, as well as adopting the apostrophe and accented letters (Harris 2016a, 2019a). Many of these graphic expedients were drawn from the Greek-language tradition. Given Aldus' commitment to printing the great classics, this serves perhaps as an explanation of why these innovations or consolidations of use into Latin and the Italian vernacular were made by him. They were later disseminated into the other European vernaculars. He was very attentive to the material aspects of the book through the design of fonts and to a visually pleasing *mise-en-page*. Aldine editions also made use of high-quality printing supports, starting from the standard copies in paper, but also including copies printed on large paper, vellum, and blue paper. Indeed, as recently investigated by Paolo Sachet, Aldus was the first to introduce the use of blue paper as printing support (Sachet 2019). He used illustration sparsely, although what is perhaps his most famous edition, the *Hypnerotomachia Poliphili*, is itself an illustrated book (this was in fact a commission, and not part of Aldus' own editorial program).

From 1502 onwards, Aldine editions were distinctly recognizable thanks to the use of the iconic dolphin and anchor printer's device. This had the effect of creating a strong commercial brand (Lowry 1998), as well as marking the editions with a sign that identified them as originals. As early as 1501, Aldine editions made the object of counterfeit, most notably in Lyon (Shaw 1993; Kemp 1997): a sign of their widespread success, as acknowledged by Aldus' competitors. Other imitations included the printing types so carefully sourced and developed by Aldus, which were reproduced by major competitors, for example, in Paris and Florence (Barker 1974; Kemp 1991), as well as by the Lyon printers responsible for the counterfeits.

The innovations of Aldus' venture were not limited to the materiality of the individual books but extended to his entire production. His most remarkable idea was probably the creation of

editorial series (Graheli 2016, Harris 2016a, 2019a), a marketing strategy that remains in use to this day. The Greek titles represented a unit of production in themselves, made uniform through their linguistic cohesion. They also include smaller clusters such as the Greek Aristotle, printed as five separate parts but clearly intended as a coherent series (Davies 1995, 2019). However, in terms of publishing history, it was the *enchiridia* or pocket-size books that were truly groundbreaking. A consistent appearance characterized these volumes, subtly suggesting that while they were separate texts, the editorial unit was not represented by the individual book but by the series itself. In fact, such editorial strategy has nothing to envy from modern consumer perception theory and had pretty much the same effect.

Impact and Legacy

Aldus created a strong and recognizable trademark that was a synonym with high quality, not unlike Apple and Chanel today (Lowry 1998; Graheli 2016). The price of his editions reflected the idea behind his brand; he was extremely successful in configuring the printed book as an object of consumption. At the same time, many of his editions made the great Greek (and, to a lesser extent, Latin) classics available in print. Some of these continued to be used as the authoritative edition well into the nineteenth century. Aldine editions were openly situated at the high-end of the market, a notion that was reflected in their starting retail price (Lowry 1979; Harris 2016b, 2019a, b) and in the various possibilities for custom-made copies. Imitations followed throughout Europe – either as fully-fledged counterfeits, or new impressions that reproduced the Aldine edition down to the dedication or preface signed by Aldus. The scholarly rigor of many of these texts has since been questioned, but their prestige and status cannot be overstated.

Aldus' marketing expedients, such as the publication of titles in series, and his use of the anchor and dolphin printer's device were highly innovative and left a durable mark on the book

trade. A list of his remarkable achievements and innovations has recently been published by Neil Harris demonstrating to what extent his venture impacted the world of the hand-press book (Harris 2016a; Harris 2019a). The way we still experience books and the act of reading today owes much to his contribution to the materiality of typography and publishing.

Abstract

Marcus Marci was a Czech physician (the personal physician of the emperor Ferdinand III) and polymath who significantly contributed to medicine, mechanics, optics, and chiefly to philosophy. As a physician he supported Paracelsian views; he contributed to medicine through his studies on the nature of epilepsy and its treatment. In mathematics, he was attempting (without remarkable success) to deal with the quadrature of a circle. More important are his two writings on natural philosophy *Idearum operatricium idea* (Prague 1635) and *Pán en pantōn sive Philosophia vetus restituta* (Prague 1662, 2. ed. Leipzig 1676) in which he defended hylozoism against the Jesuit scholastics of his time. Although hylozoism was not an exceptional conception in Renaissance philosophy, due to his Prague scholastic opponent Arriaga, Marcus formulated and justified this teaching with greater conceptual accuracy than was usual among other hylozoists of this time.

Biography

Marcus Marci studied philosophy and theology at Jesuit schools in Olomouc, and then medicine at

the Medical Faculty reestablished after 1620 by Jesuits in Prague, becoming its first professor. He was appointed the personal physician of the emperor Ferdinand III who also made him an honorary nobleman. Following his wife's death toward the very end of his life, Marcus entered the Jesuit order, despite his earlier disagreement with the Jesuit standpoints on several church-political and mostly philosophical issues. As a physician he supported Paracelsian views; he contributed significantly to medicine through his studies on the nature of epilepsy and its treatment. In the field of mechanics, he was one of the first to deal with the impact of elastic spheres. His optical treatise on the nature of rainbows later attracted the attention of J. W. Goethe, who mentioned the work in his *Farbenlehre*. In mathematics, he was attempting (without remarkable success) to deal with the quadrature of a circle. He remained in contact with significant scholars of his time; fragments of his correspondence with Juan Caramuel de Lobkowitz have been preserved as well as his letter to Galileo Galilei.

Philosophy

In agreement with Peripatetics, in his treatise *Idearum operatricium idea*, Marcus held that bodies consist of passive matter (which is, nevertheless, able to exist separately, in his view) and the substantial form. To explain how the substantial form can become the formal cause of living substances that are nonhomogenous, he presumed that various "ideas" emanate from the substantial form to shape various parts of a living substance. This disagrees with Peripatetic teaching, of course. Marcus' "ideas" are sort of partial substantial forms emanating from the original substantial form in living substance, and shaping its individual parts.

The primary goal of Marcus' other philosophical writing *Philosophia vetus restituta* was to defend his doctrine against objections raised by the Jesuit philosopher and theologian Rodrigo de Arriaga, Marcus' Prague University colleague. A further aim was to correct the erroneous interpretation of his views found (in Marcus' opinion) in F. M. Van Helmont's works. But in addition to

this, Marcus' original theory dealt with individual substances from which, in Marcus' former view, the material world consisted. Now, in *Philosophia vetus restituta*, Marcus abandoned this pluralistic conviction, asserting that the whole world is only one sole living substance (hylozoism). This substance consists of a continual matter and only one substantial form (named "world soul" at times). Following the Christian form of creationism (as well as Hermetic books in part, specifically the so-called *Poimandros*), Marcus depicted the history of the world in a manner calling to mind the Big Bang Theory to a certain extent. In the beginning, God created the "Chaos" i.e., a dimensionless being, consisting of matter and form (soul), a sort of a "semen" which had become the starting point of the whole consequent development of the cosmos. This development happened through the gradual emanation of ideas, the formal causality of which made the world gain quantity, grow, and differentiate into various parts resulting in its current form. The world is thus similar to a huge living organism, a massive plant. Since such a "plant" is provided as the sole specimen, its development cannot be known by experience but solely from Scripture (from the Moses hexaemeron etc.). On these grounds, Marcus further developed his astronomical (astrological) theories, his anthropology, as well as the principles of his medicine.

Although hylozoism was not an exceptional conception in Renaissance philosophy, due to his Prague scholastic opponent Arriaga who had declared this doctrine absurd, Marcus formulated and justified his teaching with greater accuracy than was usual among other hylozoists of this time. The second posthumous edition of Marcus' *Philosophia vetus* in Leipzig (1676) shows the interest that there was in his work, even abroad. Dunin Borkowski (*Der junge Spinoza*, München 1910, p. 353) stressed partial similarities between Marcus' and Spinoza's views. Nevertheless, in this respect, it should be taken into account that Marcus, unlike Spinoza, was a dualist distinguishing between the created world and its creator. Also, he was able to incorporate into his conception the teaching of the immortal soul in the form of the human body and even of

transubstantiation. Therefore, he remained all his life in accordance with the ecclesiastic authorities, and his thought was also positively reflected by several of Prague's monastic scholars.

Abstract

Maximus Margunios was a sixteenth-century Greek scholar. He devoted his life to Church and got engaged in the intense debate between the supporters and the opponents of the unification of the Greek Orthodox and the Catholic Church, resulting in his prosecution by the Venetian authorities. He also worked as an editor and teacher in Italy and Greece.

Biography

Margunios was born in Candia. His father was a merchant and spent most of his time in Venice. His mother was a member of the Colona family, one of the most prominent Roman families. Margunios studied Greek language and letters in the school of the monastery of St. Catherine of Sinai at Candia. In addition, Gaspare Viviani taught him Latin. In 1568 he moved to Venice and studied philosophy, theology, medicine, and law at the University of Padua. His studies and his personal readings inclined him toward Aristotelian philosophy. In Venice, he associated with Gabriel Severus, Daniel Rourlanos, and Meletios Pegas. Jeremias II, the Patriarch of Constantinople, called Margunios and Severos in Constantinople and assigned them the task of reorganizing Greek education. Margunios rejected the offer,

returned to Crete, and got embroiled in disputes about the Christian dogma. In Crete, he wrote a treatise on the filioque in which he expressed conciliatory views. In 1584 Jeremias II nominated him bishop of Cythera. The local authorities did not accept his nomination, and Margunios had to return to Crete. He attempted to negotiate a solution with the Venetians and traveled to Venice. In 1586, the Venetian government gave him permission to stay in Venice and teach Greek and Latin, he was refused once again to go to Cythera to practice his duties. During that period, he was accused by his former friend Severos of supporting the positions of the Catholic Church concerning the filioque. Margunios held that the two Churches could comply if they managed to overcome their differences. Jeremias II and Meletios Pegas mediated between the two men and the dispute ended. In 1591 Margunios was charged by the Roman Inquisition as a result of his contacts with the Lutherans. Around 1600 he returned to Crete.

Innovative and Original Aspects

Margunios edited and published numerous theological and humanist treatises. He was also a great admirer of Cardinal Bessarion. Margunios studied thoroughly the works of St. Augustine and became his chief admirer and commentator in the sixteenth-century Greek-speaking world. In his conciliatory texts, he usually draws on St. Augustine and Thomas Aquinas in order to vindicate the rightness of filioque. Margunios argued that Augustine was the only that achieved to incorporate Platonic insights into Christian theology. Margunios blamed Scholarios and Marcus Eugenikos for misinterpreting Augustine and creating confusion for their readers.

Impact and Legacy

Margunios, like John and Theodosius Zygomalas, corresponded with Martin Crusius and contributed to the spread of Greek thought in Western Europe. Despite Severos' hostility, the

reprobation of his views from conservative theologians, and the persecutions from the Catholic Church, Margunios was highly esteemed by his colleagues.

Mariana, Juan de

Born: Talavera de la Reina, Spain 1536

Died: Toledo, Spain 1624

Abstract

The Jesuit theologian Juan de Mariana was the leading historian and one of the most distinguished political and economic theorists of

early modern Spain. His political and historiographical work earned him fame, even notoriety already during his lifetime. His intellectual legacy is characterized by its endurance and complexity.

Mariana's political writings – *De rege et regis institutione libri III* (1599) and some of the essays collected in *Tractatus VII* (1609) – probe, challenge, and widen contemporary notions of monarchical authority, political ethics, economic policy, and Spanish identity. *De rege* stands out as a prime example of Spanish literature of reason of state, especially for the way in which the Jesuit blends scholastic legal and constitutional theory into a language of political prudence. The short treatise *De monetæ mutatione* (printed in *Tractatus VII*) presents an incisive critique of the monetary policies of the Spanish government during the early 1600s. Mariana did not hesitate to speak his mind and did not spare his own order either, as testified by a critique of the government of the Society of Jesus first published posthumously in French in 1625. His monumental work of historiography – *Historiæ de rebus Hispaniæ* (1592) – was much less controversial and immediately acknowledged as a major milestone in Spanish historiography. Translated and published in the vernacular in 1601, it made him a household name in Spain and a principal authority on Spanish history well into the eighteenth century.

The Jesuit combines great insight and integrative understanding of a wide range of subject matters with sharp political analysis and often acerbic critique of governing elites. The political thinker, historian, economist, theologian, and philologist in Mariana cannot easily be separated from one another. He straddles different fields of knowledge and deliberately intertwines and evolves scholastic and humanist traditions, terminologies, and modes of enquiry. Mariana is the contemporary of Giovanni Botero, Jean Bodin, and Justus Lipsius as much as Luis de Molina and Francisco Suárez and can no longer simply be aligned as a member of the so-called School of Salamanca.

Biography

Juan de Mariana was born in Talavera de la Reina, Castile, in 1536, the illegitimate son of Juan Martínez, latterly dean and canon of the collegiate church of Talavera, and Bernardina Rodríguez. We know no more about his childhood and youth than what we can glean from Mariana's own sparse remarks. He went to study at Alcalá de Henares, joined the Society of Jesus in 1554, and was ordained in 1561. Jesuit superiors quickly picked up on his sharp intellect and pedagogical talent and sent him to teach at the Jesuit colleges in Rome, Loreto, Messina, and Paris. The time in Paris, where he witnessed the “miserable spectacle” (Mariana 1599) of the St Bartholomew Night's Massacre (1572), was in many ways formative for his view on issues such as courtly politics, religious toleration, and the importance of reputation and personal conduct in a ruler. In 1574, he successfully engineered his return to Toledo. Ill health, a desire to dedicate himself to study, and flagrant tensions between French and Spanish Jesuits as a result of Spanish intervention in the French Wars of Religion provided pressing motives.

Mariana spent the remaining 50 years of his life in Toledo, continuously engaged in study and writing, a highly respected member of the Toledan intellectual and cultural scene. He already enjoyed a growing reputation as a historian and biblical scholar by the time he arrived back in Spain. In 1577, he delivered a judgement for the Inquisition on the Polyglot Bible published under the direction of Benito Arias Montano (1572). While in many ways critical of the philological standards and the team assembled by Arias Montano, Mariana saw no conflict with Catholic doctrine and approved of the polyglot. The detailed critique cum defense of Arias Montano's bible (printed in *Tractatus VII* as *Pro Editione Vulgata*) showed the depth of his philological and theological scholarship. Soon, the Jesuit was extensively involved in the preparation of the new Indices of prohibited and expurgated books published by the Inquisitor General Gaspar de Quiroga in 1583 and 1584. Somewhat paradoxically, Mariana never finished his two great projects in ecclesiastical

history – a history of the Spanish church from the beginnings down to the present day and an edition of the works of Isidore of Seville.

His expertise introduced him to the *contubernium* of scholars gathered by García de Loaysa Girón (1541–1599), canon of the cathedral chapter and later archbishop of Toledo, the most influential ecclesiastical advisor of Philip II of Spain and tutor to his son, the future Philip III. Members of the group shared a strong interest in Spanish history, especially the history of the church of Spain, and were dedicated to the documentation and defense of Toledo's contested claim to the title of Spain's primate see. Loaysa became a constant and generous patron of Mariana's scholarship and made possible the initial publication of the *Historiae de rebus Hispaniae*. The work is the result of Mariana's conviction that Spain lacked a Latin history that would familiarize European readers with "the beginnings, then the ways, by which [Spain] achieved the grandeur it has today" (Mariana, *Historiae*, prologue). It is indeed Mariana's "monumental achievement" (Kagan 2009) to have provided just that.

Loaysa also persuaded the Jesuit to write and publish *De rege et regis institutione*. The treatise betrays its didactic origin, the fact that it was originally conceived as a mirror of princes to assist Loaysa in preparing the future Philip III for the business of government. Mariana understands learning – in particular learning about the "superhuman challenge" of ruling the monarchy of Spain – as a necessarily strenuous exercise. The treatise confronts readers with hard, sometimes unpalatable truths about monarchs and the institution of monarchy, past and present. His comments about the damaging influence of a royal favorite on the reputation of a king and the quality of government aimed squarely at the relationship between King Philip III and the Duke of Lerma.

Mariana's relationship with the government in Madrid took a further blow with the publication of his essay *De monetæ mutatione* as part of *Tractatus VII* in 1609. The trenchant and convincing critique of Lerma's fiscal policies earned Mariana a charge of *lèse majesté*, brief incarceration at a Franciscan convent, and the attention of economic historians ever since. It is not clear

whether the trial was ever brought to a conclusion. Mariana appears to have escaped without much more than a stern reproach for publishing his forthright thoughts abroad. Already a cause of discomfort for the Jesuits in Madrid and Rome, the treatise and trial got Mariana into further trouble with his order. A search of his quarters led to the discovery of a treatise highly critical of the government of the Society of Jesus. Originally composed in the context of the stormy General Congregation of 1593, the treatise was possibly never intended for publication. One of Mariana's major criticisms of the Jesuit General Aquaviva was the use of "purity-of-blood" legislation as a means to silence and exclude Spanish Jesuits critical of his government. Ironically, the decree – a shadow over the lives of Jesuits of *converso* or *morisco* origin – had been rescinded by the time Mariana's room was rifled. The treatise was first published posthumously in a French translation as *Discours du Père Jean Mariana Iesuite Espagnol, des grands défauts qui sont en la forme du gouvernement des Jesuites* (1625) and much exploited in the service of anti-Jesuit polemics.

Mariana's final years saw the completion of his main contribution to humanist theology and biblical exegesis – the *Scholia in Vetus et Novum Testamentum* (1620) – but no further controversy. He died a highly respected member of the Society of Jesus and the European republic of letters at the house of the order in Toledo on 17 February 1624.

Heritage, Innovation, and Originality

Mariana's *Historiae de rebus Hispaniae* is the first work to unite the separate histories of the various Spanish kingdoms into one consolidated and altogether coherent narrative. It successfully competed with the many existing histories of individual Iberian kingdoms such as the one by Jerónimo Zurita (1512–1580) for his native Aragon. It was clearly the kind of history of Spanish identity and greatness that Philip II and prominent members of the Royal Council of Castile had been hoping to see published for some time.

Mariana is open about his intention to integrate the many existing, separate histories of the Iberian

kingdoms into a more comprehensive and more holistic fabric of historical interpretation. Yet, as the title suggests, he does not amalgamate and elide the histories of the many communities and peoples of the Iberian Peninsula. He discusses and compares the distinct political and constitutional traditions of individual kingdoms and, for instance, shows patent sympathy for the laws of Aragon and how they restricted the power of kings. The *Historiae* are not an artificial projection of “Spain” as only ever “one nation.” Rather than concocting a fusion of Iberian history that would neither have reflected contemporary political consciousness nor stood up to scholarly scrutiny, the Jesuit conceptualized Iberian history as sacred or messianic history.

The 25 volumes of the *Historiae* read as a history of sin and redemption from sin, a story that stretches from pagan Spain to conversion to Christianity, and from the failings and fall of the last of the Visigothic kings and Moorish occupation to the eventual completion of the *Reconquista* under the Catholic Monarchs and Spanish global hegemony under their great-grandson Philip II. The Spain of the *Historiae* is an imagined community of communities that already existed in Roman times. With the conversion to Christianity, it set itself on a rocky path to greatness and glory. It is a history as rich in deviation and setbacks – such as the loss of the first Armada in 1588, which Mariana acknowledges almost in passing – as it is in achievements. The first edition (1592) ends with the conquest of Granada, the Columbian encounter, and the restoration of “good government” in Spain during the rule of the Catholic Monarchs, Isabella I of Castile, and Ferdinand II of Aragon.

The work reaches deep into a complex past but points to the present and future, too. While generally hesitant to address contemporary issues directly, Mariana clearly considers the recent annexation of the kingdom of Portugal by Philip II (1580) a point of reference. Philip’s accession to the Portuguese throne is an act of divine providence: the unification of the whole of the Iberian Peninsula under one Catholic prince. Like his contemporary, the Italian ex-Jesuit Giovanni Botero in his *Relationi Universali*, though less

explicitly, Mariana puts the Spain of Philip II in the vanguard of the defense and eventual triumph of universal Catholicism.

The successful completion of such a compendious work had a methodological price tag. Fellow historians like Pedro Mantuano and Antonio de Herrera y Tordesillas pointed out that Mariana had included historical conjecture such as the fabrications of Annius of Viterbo. Mariana in turn readily confessed to shortcomings of his work and the fact that it contained regrettable errors – not always corrected in his own later editions – as a result of the need to rely in several instances on the works of his predecessors. In a letter from 1596, he justified himself, explaining that he could not but accept what other historians had said “without verifying all of the details, for otherwise I might never have finished” (Cirot 1905, p. 433). The work nonetheless enjoyed overall success at court and in scholarly circles, which led to royal support for the publication of a revised and extended Latin version (1596) as well as a translation into the vernacular by the author himself (1601), further extended and republished in 1623. The translation gained the work a much wider readership and made the *Historia general de España* a staple on bookshelves from Madrid to the far reaches of the Habsburg empire.

History remained the vantage point of Mariana’s intellectual endeavor, including his *De rege et regis institutione libri III* (1599) dedicated to King Philip III of Spain. Mariana established the correlation between his treatise on kingship and the reading of history in the preface of the *Historia general de España*. *De rege* provided a theoretical discussion of “all the precepts, counsels and rules” (Mariana 1601, preface, p. 3) that ought to govern the decisions of a good king. Historical *exempla* – some included already in *De rege*, even more in his history of Spain – showed how maxims of political prudence had actually worked in the political arena.

Though topical, the appeal to history as *magistra vitae* points to one of Mariana’s major contributions to Spanish political thought. *De rege* anchors the discussion of many themes familiar from Renaissance and early modern mirrors-of-princes literature in the history of

Spain. Alongside a host of classical and Christian authors, history (and Spanish history in particular) is the inspiration for a decidedly pragmatic political ethics for the preservation of the Spanish Habsburg monarchy and the Catholic faith in Spain. The treatise also includes strident critiques of what the author perceived as the ills of Spanish government and society as well as his proposals for moral and political reform.

De rege is part of a wider European literature on reason of state as well as a Spanish debate on the state of Habsburg Spain at the turn of the century and her future under a young and inexperienced king. Other significant and paradigmatic participants in that debate – at either side of a highly differentiated spectrum – include the veteran diplomat Baltasar Álamos de Barrientos (1555–1640) (*Discurso político* 1990/1598; *Tácito español* 1614) and the Jesuit theologian Pedro de Ribadeneyra (1526–1611) (*Tratado* 1597). While indebted to scholastic moral theology, the treatise is in the “Tacitist” camp – alongside authors such as Álamos de Barrientos, Giovanni Botero, or Justus Lipsius – as long as “Tacitism” is understood in a general sense as the acknowledgement of the sombre reality of early modern politics and the compromising need to negotiate between moral ideals and political necessity.

Mariana approaches the moral predicaments and salient issues in political ethics in ways that are didactically and rhetorically effective as well as innovative with regard to the use of intellectual traditions. One example is the discussion of human nature and the origins of civil society that introduces and underpins the argument of *De rege* as a whole. Mariana describes civil society – with private ownership and political power in its wake – as the result of the Fall of Adam and as invariably affected by human corruption. The Jesuit does not share the Thomist-Aristotelian view that secular authority is rooted in natural law largely unscathed by original sin. Elegant humanist prose and creative use of Aristotelian terminology sometimes conceal an incisive neo-Augustinian critique of major tenets of Thomist political philosophy, setting Mariana apart from the majority of theologians commonly subsumed under the “School of Salamanca.” This pessimistic political anthropology determines an appraisal of monarchy, especially

hereditary monarchy, as a manifestation of human corruption in history and, at the same time, as the only form of government able to contain and correct human depravity.

Another closely related example and hallmark of *De rege* is the blending of scholastic and humanist traditions, terminologies, and modes of reasoning. The brief discussion of tyrannicide in book one of *De rege* – the part which has received the most attention from historians of political thought – is one example. It is cast not in terms of natural or positive law but of prudence. Mariana states that monarchical authority historically derived from the people and turns on rulers who aspire to seize “supreme and maximum authority without limits” (de Mariana 1599, p. 90). While a body politic can freely transfer “full and unlimited authority to a prince,” this is likely to set prince and people on the road to tyranny. A prince deaf to the precepts of political prudence and blind to the dangers of tyranny will always be able to bend or ignore the law. Yet lack of respect for his subjects and the lessons from history might well lead to rebellion, foreign invasion, and violent removal from power, even assassination (as in the case of Henry III of France). Mariana is deeply aware of tyrannicide as a complex constitutional problem, and the argument is rich in references to scholastic legal concepts and formulae. Yet these are presented no longer as binding juridical principles but as maxims of political prudence. Mariana considers laws more of a menace to the liberty of subjects than a safeguard. The peace and protection of the commonwealth do not depend on legal-constitutional frameworks but on the prudence of the prince and his ability to handle major political stakeholders effectively.

Personal experience and historical reflection invested Mariana with doubts about the ability of monarchs, laws, and parliaments to preserve peace and stability. He is even more suspicious of the nobility, which he sees as a permanent threat to the internal balance of power. His views are reflected in the last chapters of each of the three books of *De rege*, where he extols the role of religion as “the sinews that hold society together” and of the Castilian episcopate as the only real “guardians of the realm.” Mariana’s proposals for a much greater role of the Church of Castile in imperial government alone still justify

Cirot's description of *De rege* as "the most remarkable and boldest of books in Spanish political literature" (Cirot 1905, p. 35).

Impact and Legacy

Mariana is generally acknowledged as the principal historian of the peninsular realms – the Americas hardly feature in any of his work – during the reigns of Philip II and Philip III of Spain. The 1596 Latin edition and especially the 1601 vernacular edition were reprinted throughout the seventeenth and eighteenth centuries, including translations into French and English. Considerably expanded versions of the *Historia* were published in Madrid and Barcelona as late as 1820 and 1839, respectively. The most extensive study is still Cirot (1905). Kagan (2009) and Olds (2015) embed Mariana in the context of Spanish official historiography from the sixteenth to the eighteenth century.

De rege has enjoyed the most turbulent and complex reception among Mariana's works by far. In Spain, the treatise became a frequent point of reference for authors participating in the wider debate on the reform of the monarchy until the nineteenth century. In France, on the other hand, Catholic and Calvinist *politiques* read it as a confirmation of Jesuit intentions to secure a Spanish succession to the French throne. Mariana was accused of propagating a radical doctrine of popular sovereignty including the right of any private individual to kill a legitimate king perceived as a tyrant, a way of thinking seemingly akin to that of the so-called French Monarchomachs. This interpretation was largely based on a few, frequently distorted citations from chapter 6 of book 1 of *De rege* and reflects anti-Jesuit feelings rather than Mariana's intentions or what he wrote. Regardless, *De rege* continued to be a byword for regicide and anti-monarchical subversion and a liability to the reputation of the Society of Jesus well into the twentieth century.

Modern historians of political thought in turn saw the treatise as part of the "embryology of modern politics" (Figgis 1907, p. 34) and a milestone in the development of medieval scholastic constitutionalism toward parliamentary democracy

(Lewy 1960). Gradually, the picture became more differentiated. The modern critical edition and translation of *De rege* into Spanish still identifies Mariana as a "humanist precursor of constitutionalism" (Sánchez-Agosta 1981, title page) but also identifies modes of reasoning not familiar from neo-scholastic contemporaries. Others highlight neo-Stoic themes that invite comparison with Justus Lipsius (Oestreich 1989) or single out "anti-Tacitist" (Skinner 1978) and "imperialist-Tacitist" (Tuck 1993) themes, respectively. More recent and detailed studies situate Mariana ever more firmly and sensitively within his actual discursive environment – the early modern European debate on reason of state, the mirror-of-princes literature, scholastic moral theology and Jesuit political-theological debate, and especially the Iberian and Castilian political and cultural environment which largely inspired his writing (Braun 2007, 2013; Höpfl 2004; Merle 2014; Reinhardt 2007; Truman 1999).

There is a rich, mostly Spanish literature on Mariana's philological and biblical work (Ferraro 1982), especially the *censura* on the Polyglot Bible (Bujanda 1993; Wilkinson 2007). Mariana's treatise *De monetarum mutatione* and respective contribution to the development of liberal economic theory has received considerable attention since the beginning of the twentieth century (Laures 1928) and continues to be the matter of a constantly evolving debate. This is perhaps the area of Mariana studies in most urgent need of further attention.

Abstract

Lucrezia Marinella was a prolific Venetian author and poet notable for her contribution to the *querelle des femmes*, the debate on the status of women. In particular, she argued for the superiority of women drawing from both

the Platonic and Aristotelian traditions, as well as historical, literary, and scriptural examples.

Alternate Names

Marinelli, Lucrezia

Biography

Lucrezia Marinella was born in Venice in 1571 to Giovanni Marinelli, a physician, humanist, and author, who was likely responsible for her thorough education (Cox 2008). In her lifetime, Marinella was praised by contemporaries for her literary prowess, philosophical knowledge, and musical talent (Zaja 2008). She died in Venice in 1653. Although she is now primarily known for her treatise in defense of women, *Della nobiltà, et l'eccellenza delle donne, co' difetti et mancamenti de gli huomini* (1600, 1601), she was highly prolific (Cox 2011). Her works span many genres: from religious and hagiographic poetry, such as *La Colomba sacra* (1595) the *Vita del serafico e glorioso s. Francesco* (1602), and the *Rime sacre* (1603) to the pastoral novel, *Arcadia felice* (1998), and epic poetry, *L'Enrico, overo Bisantio acquistato* (1635), to name a but a few.

Heritage and Rupture with the Tradition

It has been suggested that Marinella had close ties to the Second Venetian Academy (Zaja 2008; Kolsky 2001). In particular, *La nobiltà et l'eccellenza delle donne* may have been commissioned by the one of the academy's members and its official printer, Giovan Battista Ciotti, as part of the institution's response to the publication of a controversial misogynist work, *I donneschi difetti* (1599), by Giuseppe Passi. Since the latter argued that women had no intellectual worth, it would have been a very effective polemical strategy to publish works by women in defense of their gender (Kolsky 2001). In the same year, another academician, Giovanni Doglioni, published the late Moderata Fonte's dialogue, *Il merito delle*

donne (1600). Moreover, Marinella's treatise is an explicit response to Passi's work, both in its content and structure. Although it is one of the first philogynous works by women, it can be inserted into a broader debate on the status of women, often called the *querelle des femmes*, starting around the end of the fifteenth century in Italy. This debate includes works by Bartolomeo Goggio, Mario Equicola, Agostino Strozzi, Galeazzo Capra, Domenico Bruni, Lodovico Domenichi, Alessandro Piccolomini, and others.

Impact and Legacy

Marinella's treatise *La nobiltà et l'eccellenza delle donne* contains her most important philosophical contribution: a developed argument for the superiority of women over men. Participants in the *querelle des femmes* typically argued for the superiority of one sex over the other, but Marinella stands out among pro-woman authors for asserting that both women's souls and their bodies are nobler than men's.

In order to maintain that women and men constitute a single human species, she allows that God, the productive cause of all created beings, permits diversity in the souls of individuals of a species. In Marinella's view, the idea of woman in the mind of God is nobler in the sense that her purpose is superior to that of man. The purpose or final cause of woman is superior because her intellect is less troubled by passions and her desires more moderate insofar as they are determined by reason.

In her argument for the superiority of women's bodies over men's, Marinella makes use of both the Platonic (through Ficino and Leone Ebreo) and the Aristotelian traditions. She asserts (uncontroversially, at the time) that women are more beautiful than men, and that beauty in a human body is an effect of grace that proceeds from the soul; the soul is the origin of physical beauty. So the beauty of women is a manifestation of the superiority of their souls (Deslauriers 2012). At the same time, it is the mark of the greater divinity of women. The reason, then, that men are drawn to women is that they desire to possess the divine. So Marinella construes men's

sexual pursuit of women as an admission of the superiority of women.

At the same time, she argues that the relative coldness of a woman's body (a fact she takes to be established by Aristotle) makes it a better instrument for both intellectual and moral operations of the soul. Against Aristotle, she argues that women are not cold in absolute terms, but rather moderate in temperature (Deslauriers 2016). The temperate nature of a woman's body allows her soul to operate with sufficient force but without excessive passion. The result is that women are more virtuous, less inclined to both anger and appetite, and better able to form stable intellectual concepts.

Abstract

The Lutheran philosopher Cornelius Martini is considered to be the first to teach Aristotelian metaphysics at a Protestant university. The absence of a *metaphysica specialis* including natural Theology is a prominent feature in Martini's metaphysical outlook as well as his doctrine of the angels and separated souls. Over the question of the relationship between philosophy and theology, he came into dispute with his Helmstedt colleague Daniel Hofmann, a supporter of the double-truth thesis. Among his most important students were Georg Calixtus, Jacob Martini, and Henning Arnisaeus.

Biography

The Lutheran philosopher C. Martini was born 1567/8 in Antwerp. He studied in Rostock with David Chytraeus and John Caselius. He was appointed Professor of Logic in 1591 in Helmstedt where he worked until his death in 1621. As an authority in Italian Aristotelianism, he began his fight against Peter Ramus. Ramus had heavily polemicized against Aristotelian philosophy, especially against logic and metaphysics. Martini defended Aristotelianism, which he found to be compatible with the Christian religion and its teachings.

Over the question of the relationship between philosophy and theology, he later came into dispute with his Helmstedt colleague Daniel Hofmann, a supporter of the double-truth thesis. A few years later, Martini was in trouble with the Wittenberg theologian Balthasar Meisner. The question was whether theological arguments should be given in a syllogistic form or not. In his definition of logic, Martini followed Jacopo Zabarella, the prime representative of Renaissance Paduan Aristotelianism: Logics is an intellectual habit using terms of the secondary order. Logic is concerned with concepts derived from the first order – which includes the natural and contingent things – to structure thinking and reach the right propositions.

Martini is known as the first to teach Aristotelian metaphysics at a Protestant university. The lecture took place from November 1597 until October 1599 in Helmstedt. This was an important innovation of late Humanism, a movement that was still dominated by Melanchthon's anti-metaphysical sentiment. Martini's groundbreaking lecture ensured his legacy as the founder of Protestant academic Metaphysics in Germany. His lecture was distributed throughout numerous manuscripts. Unlike Ramus, Martini stressed the need for a philosophical science based on realism, and that was the task of Metaphysics. He defined the *ens qua ens*, the being qua being, as that which exists independently of the mind (*ens reale* or mind-independent being). The part of being that only exists in the mind (*ens rationis*, being of

reason), a chimera, for example, is therefore not a part of metaphysics. To support his case, Martini pointed to the fact that being is the first thing really known (*primum cognitum*). Every human cognition, be it ever so vague, takes its initial step from the first thing.

Martini's *Metaphysica Commentatio* starts with an introduction to Aristotle's metaphysics, even before Martini develops the concept of being. The transcendentals *one, true and good, act and potency, whole and part, and the like* are described in detail. The absence of *metaphysica specialis* including natural Theology is a prominent feature in Martini's metaphysical outlook, as well as his doctrine of the angels and separated souls (*animae separatae*). Here, Martini followed Benito Pereira's distinction between first philosophy as the science of being (later labeled ontology) and metaphysics as the science of God. A student of Martini published the lecture in 1605 and labeled it *Metaphysica Commentatio*. In addition to logic and metaphysics, Martini also taught physics and ethics. The disputation series was only published posthumously. Among his most important students were Georg Calixtus, Jacob Martini, and Henning Arnisaeus.

Abstract

Jakob Martini is one of the most famous German Lutheran philosophers and theologians of the seventeenth century. His books on logic and

metaphysics were very important for the new Lutheran style of Aristotelian Philosophy. Martini was, oddly enough, influenced by the content and methodology of the Philosophy of the Jesuits. He wrote also one of the first philosophical works in the German language to fight against a radical group of anti-philosophers.

Biography

After he had finished his school education in Halberstadt and Aschersleben, the German Lutheran philosopher and theologian Jakob Martini began studying philosophy in Helmstedt and Wittenberg in 1590. Cornelius Martini and Daniel Cramer were his teachers. They were firmly rooted in the late humanistic, Aristotelian tradition. After teaching at Wittenberg and working as a rector at the Gymnasium in Norden (East Friesland), Martini became a professor of logic in Wittenberg in 1602.

As early as 1603, he published his first collection of disputations on logic. Martini adopted Jacopo Zabarella's recently established understanding of logic as an intellectual and instrumental habit for all scientific disciplines (including theology), against Ramistic and semi-Ramistic tendencies on the part of the Reformed. He also opposed efforts to establish a "Christian logic."

Martini did not regard logic as an invention of the Holy Spirit. He rather considered it to be a natural capability of the human mind to distinguish the truth from what is false by a syllogistic process. Nevertheless, there is the need, in theological contexts, to modify natural logic in order to adapt it to the "holy things."

Martini prepared the way for his student Balthasar Meisner, who established a "logic of mystical predications" to solve particular Christological problems. In Wittenberg, during the same year, 1603, Martini gave a lecture on metaphysics. This collection, published under the title *Theorematum Metaphysicorum Exercitationes*, is the first one in which the direct influence upon the content and methodology of the *Disputationes Metaphysicae* of the Jesuit Francisco Suárez, which was published in a second edition in Mainz in 1600, can be noted.

Martini's division of metaphysics into a *Metaphysica generalis* on the one hand and a *Metaphysica specialis* on the other had a long-term influence on Lutheranism. In a collection of disputations from 1611, he tried to give metaphysics a specifically Lutheran character. Martini vehemently rejected the attempt of the Reformed Philosopher Clemens Timpler to make not-being (*non ens, nihil*) a subject matter of metaphysics. According to Martini, it is neither intelligible nor anything at all.

Within a short time, he published other books on ethics, psychology, and physics. Thus, he became the leading head of the Lutheran high schools and universities. His writings replaced textbooks of Melancthon, which appeared outmoded at that time. The philosopher Martini also had an impact on theology, particularly in his fight for what he considered to be the right relationship between philosophy and theology. The religious opponents were not only the Catholics and the Calvinists but also the anti-Trinitarians and Socinians, whom he accused of an unreflective use of reason in theological questions.

Also significant is his *Vernunftspiegel* (*Mirror of reason*), published in 1618, one of the first philosophical works in the German language; it was directed against the "enthusiastic fighters against reason," especially Wenzeslaus Schilling and Johann Angelius von Werdenhagen. He campaigned for prudent philosophizing, preserving the peculiarities of theology. Georg Gutke, Balthasar Meisner, and Johannes Scharf were among his most important students.

Abstract

Marko Marulić was the most important Croatian writer in the fifteenth and sixteenth centuries, who wrote in Latin, Croatian, and Italian. He was a poet, prose writer, and translator, who left behind some 50 works, most of which were published. Some of his writings are known only by their titles. He is known as the “father of Croatian literature.”

Alternate Names

Marulić Splićanin, Marko; Marulus Spalatensis, Marcus; Pečenić, Marko; Marulus Dalmata, Marcus

Biography

Marko Marulić, born in Split in 1450, was a humanist, philosopher, poet, the founder of Croatian literature, and the most prominent representative of Humanism. He was a descendant of the old aristocratic family of Pečenić (Pecinić) from Split. He received his primary education in Split and then went to Italy to study law. After he had finished his studies abroad, he returned to Croatia and worked in his hometown. This humanistic Latinist and great erudite was actively engaged in the public life of his town. He died in Split in 1524.

He is the author of the epic *Davidias* (1516–1517?; first edition 1954), the Biblical epic *Judita* in Croatian (published in Venice in 1521), epics *Suzana* (*Susannah*), *Molitva suprotiva Turkom* (*Prayer Against the Turks*), and others. He wrote in Latin, Italian, and Croatian. Many of his works remained only in handwriting and many of them got lost. He is notable for his translation of the work by Thomas à Kempis *De Imitatione*

Christi (about 1500). He was also the first to translate *Dante and Petrarch* into Croatian.

Heritage and Rupture with Tradition

From a philosophical point of view, his most important works are *Evangelistarium* (first known edition 1516), in which he discusses the fundamentals of Christian ethics; *De institutione bene vivendi per exempla sanctorum* (the first known edition 1506–1507 in Venice), in which he glorifies Christian virtues; and the collection of parables *Quinquaginta parabola*. His work *De institutione* had several editions and was translated into several European languages during his lifetime. In these works, he discusses the fundamental moral issues with continual reference to real-life situations. This reveals his sense of subtle psychological analyses. The principal preoccupation of M. was *spiritual revival*. He belonged to a very important European movement *the Devotio Moderna*. He saw the potential for spiritual revival primarily in the restoration of the basic Christian virtues. In promoting the practice of these virtues in his work *De institutione*, he often favors the ascetic tradition. M. does not deal with virtues in theory, but gives practical instructions for life, referring to the saints from the Bible as role models. Due to his humanist education and knowledge of classical traditions, he often contrasts classical and Christian moral principles, opting for the latter, deeply convinced that only Christianity can provide a solid foundation for a moral life. He rejects any form of moral relativism and puts religion above any philosophical debate on moral issues. Although the starting point in the elaboration of moral questions is his Christian worldview, he advocates the genuine Christian doctrine urging the restoration of Christianity. Comparing the differences in Greco-Roman and Christian morality, he acknowledges some of the Stoic postulates, attempting to bring them into line with the Christian ones.

His zeal in defending Christian moral principles was provoked by the political-historical circumstances of his time, with most of Bosnia and Croatia under Turkish rule. The political alternative for the Croatian people of the time was either Islam or Christianity. M. advocated for “*unio et*

pax omnium Christianorum.” He appealed to the European nations to join their forces and support his nation which formed the first line of defense in the battle against the Turks.

Innovative and Original Aspects

He represents the generation of Croatian writers who were forced into bilingualism. M. writes in the universal language of the time, Latin, to address the European scientific community, while in his poetic works on moral topics he addresses a wide audience of readers in his national language. Although deeply immersed in Christian worldview thinking, M. can be considered a Renaissance thinker, primarily because he promoted the idea of individualism.

Impact and Legacy

Marulić influenced many Croatian poets from the sixteenth to the twentieth century. His writings, translated into many European languages, were very popular, especially in the sixteenth and seventeenth centuries. They were read by distinguished European intellectuals (St. Francis Xavier, St. Francis de Sales, Thomas More, Francisco de Quevedo, Pierre Bayle, and others).

Marvell, Andrew

Born: Winestead, England, March 31, 1621
Died: London, England, August 18, 1678

Sergej Macura
 English Department, Faculty of Philology,
 University of Belgrade, Belgrade, Serbia

Abstract

A major poet of the Late English Renaissance, Marvell was recognized as such only in the

nineteenth century, as his political activity and satiric writings had overshadowed his value as a poet in the Neoplatonic tradition. His lyrical poetry uniquely draws upon both the Metaphysical poets in exuberant logical wit, passion, and sensuousness and on the Cavaliers in polished elegance and certain stock motifs.

Biography

Marvell was educated at Hull Grammar School (1629–1633) and at Trinity College, Cambridge (1633–1641), and he worked for most of the next two decades tutoring in England and on the Continent. He spent the remainder of his life after the Restoration on state business both at home and abroad. Whereas the few poems published in his lifetime are of occasional character, the 1681 *Miscellaneous Poems* reveal an incomparably broader spectrum of ideas, motifs, and stylistic virtuosity.

Heritage and Rupture with the Tradition, Innovative and Original Aspects, Impact, and Legacy

Like Shakespeare and Jonson, Marvell was a derivative lyrical poet, relying on the existent poetic practice accumulated over the ages, producing superb examples of various types of Renaissance poetry in his finest accomplishments.

He could easily have absorbed a number of Neoplatonic ideas in his college days and come into contact with the major philosophers or theologians of the Cambridge school. The ambivalent Christian view of nature as both the handiwork of God and man's prison gradually became more complicated through a fusion with Plotinus' interpretation of the world as inert and evil matter, not only an imitation of ultimate reality (Adkins 1974, 77).

Marvell accepted the belief that the battle of flesh and spirit required a constant renewal, and "A Dialogue Between the Resolved Soul and Created Pleasure" reveals his awareness of the senses as a means not only to pleasure but also to a

perception essential to a higher vision of the mind and the soul. The soul in Plotinus occupies a central position between the phenomenal world and the world of spirit, serving as the point of all converging and diverging lines. Joan Adkins views the poems "On a Drop of Dew" and "The Garden" as models of "two major Neoplatonic concepts: (1) the emanation and the return and (2) the mystic flight of the soul" (80). In the body of texts represented by these three poems, the endings remain more or less firmly Platonist, as in the soul's liberation from the flesh. The drop of dew suggests flawless physical circularity, yet the soul strives toward transcendence, since it is a ray "of the clear fountain of eternal day" (ll. 19–20), desiring to escape the impurities of natural environment.

However, Marvell's poetry does not pull only in the exclusive direction of dissolved natural images transformed into intangible ideas – "The Garden" ends on the note of the subject's earnest regret at the disappearance of the Edenic state of physical nature's purity. He does not strictly follow the historiographic line of perception from Genesis to the Apocalypse, but is instead curious to see what turns and reversals are still possible before the subjects' earthly time runs out. The enclosed garden is situated in the midst of a busy world, but even inside, it offers both movement and repose, as the soul bird spends time combing and singing (Tolliver 1980, 188).

The dialectic between engagement and withdrawal is also noticeable in Marvell's longest and most complex lyric poem, "Upon Appleton House," where he both employs and rejects aspects of a mannerist aesthetic, setting aside its most extreme and artificial forms in favor of English "naturalness" (Whitaker 1999, 308), producing an elaborate allegory of the estate as "heaven's center, nature's lap, and paradise's only map" (ll. 767–8). Perhaps the most vital *carpe diem* poem in English literature, "To His Coy Mistress," situates the speaker in an act of persuading a hesitant lady to yield to his advances. Joseph Moldenhauer maintains that structurally it resembles a syllogism whose first section is a suppositional premise, the second a premise of refutation, and the concluding third part functions as a necessary deduction

(Moldenhauer 1968, 195). Stylistically, it parodies Petrarch and the genre of the blazon in cataloguing ludicrously hyperbolic images of the mistress, so that it negates romantic pretensions of sincerity in a striking contrast between the impossible spatiotemporal categories and the gruesomeness of death.

Mas, Diego

Born: 1553, Villarreal

Died: 1608, Valencia

Simone Guidi

Sapienza Università di Roma, Rome, Italy

Abstract

A Spanish theologian and philosopher, now partially forgotten, he was a pupil of Bañez and Medina, among the greatest representatives of the so-called Salamanca School, and one of the main intellectuals of the Spanish Counter-Reformation. A great expert on Medieval and Renaissance scholastic thought, he took a strong stand against the decline of scholasticism and set out to restore Aristotelian philosophy in line with the interpretation of it given by Thomas Aquinas. In 1587 he published his *Metaphysica Disputatio de Ente et eius proprietatibus*, where he deals in a detailed and systematic way with the main problems of Aristotelian metaphysics.

Biography

Born in Villarreal in 1553 and died in Valencia in 1608, he began studying philosophy at the University of Valencia in 1566, gaining his bachelor's degree in 1568. In Valencia he then continued his studies in theology for five more years under the supervision of Joan Teres i Borrull, gaining the title of Doctor of Arts and Qualified Theologian in 1573. In 1574 he joined the Salamanca Order of Preachers. He was ordained a priest in 1579. In the meantime, from 1575 to 1577 he attended the school of theology of the University of Salamanca. His teachers there included the Dominicans Domingo Bañez and Bartolomé de Medina. After qualifying as a Master of Arts, he returned to Valencia, where he taught philosophy. From 1589 until his death, he held the Thomas Aquinas Professorship of Theology. In 1582 he founded an Aquinas Academy with the approval of Pope

Gregory XIII in order to continue Aquinas's teaching and promote intellectual training. In the last years of his life, he became remarkably influential, even politically. In 1606 he was appointed Prior of the Monastery of Valencia and in 1607 Vicar General of the Province of Aragon.

Heritage and Rupture with the Tradition

In his deep knowledge of Medieval and Renaissance scholastic thought, Mas was deeply influenced by the Salamanca intellectual world and by Thomas Aquinas's thought (Robles 1983). He took a strong stand against the decline of scholasticism. Mas's aim was to restore Aristotelian philosophy through a doctrinal renewal of Aquinas's thought (Gallego Salvadores 1970; Bastit 2004). Accordingly, in 1587 he published his *Metaphysica Disputatio de Ente et eius proprietatibus* (Mas 1587), where he looks back to the *Tractatus de Transcendentibus* by the Dominican Crisostomo Javelli and to Pico della Mirandola's *De Ente et Uno* (Di Vona 1968). In 1599 he published some of his *Commentaria in Universam philosophiam Aristotelis* (Mas 1599a, 1599b), which came several years before the work by Suárez and the Combricensi (Gallego Salvadores 1970, 1973) and which take their place alongside other works of his such as his comments on Porfirius and Aristotle's logic of 1592–1594 (Mas 1592). These are works that contemporary history of philosophy tends to pay little attention to, but they seem to have been quite influential in their time.

In the five books of his *Metaphysica disputatio de ente et eius proprietatibus*, Mas deals, in order, with the (1) problems of the being and its divisions, analogy, and the very concept of a being; (2) question of the distinction between essence and existence; (3) oneness; (4) truth; and (5) good (Wundt 1939; Di Vona 1968). In particular concerning the distinction between essence and existence, Mas, like Thomas, defines essence as "what acts by being," whereas existence is said to be "the first act performed by God on any created being, with which at a first it [the being] is placed, beyond the power of its causes," which means that, according

to Mas, created beings are able to create other beings only in a secondary sense, whereas God is the real first cause of every being. Also, while form is preeminent in the physical world, Mas held that in metaphysics individuals should be considered preeminent: both essence and form come after existence. Mas also held that existence is logically incidental, since it is something more than the essence of a thing rather than being an essential part of the thing's definition or one of its essential attributes. Existence is actually "the reason why the thing is what it is," and therefore it is not an extra characteristic independent of the created thing, but always something created together with it. Like Bañez, Mas argued that perfection coincides not only with good but also with the purpose of anything, and he considered it nobler than essence. Existence is the characteristic most commonly found in things, and it is an act of perfecting whatever receives it. Like Thomas, Mas believed that the distinction between existence and essence is real and not just a way of thinking or a modality, as many other theologians believed. Thus, Mas set himself apart from the doctrine of the modal distinction accepted by Duns Scotus and by the Jesuits, but at the same time, he stayed short of the excesses of the doctrine of a real distinction as supported by Egidio Romano.

Abstract

Jean Papire Masson is a French humanist born in 1544 and died in 1611. His works embrace numerous areas of knowledge, especially history, law, geography, and poetry. He is notably renowned for his historical books and his biographies.

Biography

Jean Masson, known as Papire Masson, was a French humanist, historian, geographer, and jurist of the sixteenth and seventeenth centuries.

He was born at Saint-Germain-Laval (Forez) on the sixth of May 1544, in a family of merchants. He studied in Billom (Auvergne), where the first Jesuit college of France was founded in 1556. In 1562, Masson became himself a member of the Society of Jesus. He travelled in Italy between 1563 and 1567, where he greatly enriched his humanist knowledge. Then, he taught in Parisian colleges, before leaving the Society of Jesus in 1569. He then befriended the jurist François Baudouin, who became his master in the University of Angers in 1571. Masson graduated as *doctor utriusque juris* (doctor of canon and civil law) and was elected rector of the university. Nevertheless, he left Angers for Paris, where he became the secretary of Philippe Hurault, who was then the chancellor of the Duke of Anjou. Consequently, he was close to the circle of Catherine de Medici. In 1576, he became a lawyer at the Parliament of Paris and, eight years later, a surrogate of the attorney general. He died in Paris on the ninth of January 1611.

Jean Papire Masson appears as one of the figures of the second part of the sixteenth century in France, due to both his career and his writings. The variety of his works reflects his extensive culture. Masson is a real humanist, who embraces numerous areas of knowledge. First, he is renowned for his historical books and his biographies. He has written about forty *elogia* and *vita*, which relate to the life of some of the great names of the Renaissance (Masson 1638). They concern state dignitaries (Charles IX of France (Bourgeon 1996), Pomponne de Bellièvre, Sebastian I and Henry I of Portugal, Lorenzo de Medici, etc.), poets (Dante Alighieri, Petrarch, Giovanni Boccaccio, Pierre de Ronsard, etc.), religious men (Charles Cardinal of Lorraine, John Calvin, Charles II of Bourbon-Vendôme, etc.), or also jurists (his master François Baudouin, Jacques Cujas, Pierre Pithou, Charles Du Moulin, etc.). His most famous historical book is the *Annales Francorum*, which sums up the French history from the Franks to Francis I (Masson 1577). Masson tries to implement a precise historical method, avoiding medieval legends.

Second, Masson is the author of legal and political works. If his legal books (mainly historical)

present a minor interest (Masson 1588), his response to François Hotman has to be mentioned (Masson 1575). Masson defends the institutions of the French monarchy against the monarchomach theories of the *Franco-Gallia*. He especially supports the prerogatives of the Parliament.

Third, Masson edited several ancient and medieval texts. For instance, he published ninety-one letters of Fulbert of Chartres and one hundred and twenty-seven of Lupus Servatus. He also published in Greek and Latin a text by Synesius. Among other editions, the *Histoire de Louis II de Bourbon* illustrates the wide range of his interests.

He wrote also poetic pieces, geographic descriptions (Masson 1618), and speeches. Even if some of his books were first published after his death, an important part of his works stays manuscript. Finally, Jean Papire Masson appears as an accomplished humanist, influenced by Italian thought. That is why he has been described as an “Italianate humanist” (Ronzy 1924a, b). If his work is not flawless, it is impressive due to its diversity and its historical significance.

Mastri, Bartolomeo

Abstract

Among the seventeenth-century promoters of Scotism, Bartolomeo Mastri (1602–1673) was conspicuous for the scope of his work, his knowledge of the authors and debates of his time, and for his refined interpretations of the philosophy and theology of John Duns Scotus. These qualities make him a precious source for an accurate understanding of seventeenth-century university thought. They have also made him an important, though not always explicitly mentioned, point of reference for more than a few modern readers of Scotus.

Biography

Bartolomeo Mastri was born in Meldola, near Forlì, Italy, on 7 December 1602 into a family belonging to the town’s minor nobility. We only have general information about his life and studies as a child. In one of his works, he wrote that he came to learn about the doctrine of John Duns Scotus even before he entered the Order of Minor Conventuals. His younger confrère Giovanni Franchini from Modena, who knew Mastri personally, reports that at the time of his investiture, Mastri had already concluded his studies on grammar, rhetoric, and poetry.

Mastri entered the Order of Minor Conventuals in about 1616. The following year he was transferred to the Order's *studium* in Bologna, where he attended all the courses on philosophy and some of those on theology. From 1621 to 1623 he was in the Order's *studium* in Naples. Here he studied theology under the guidance of his confrère Giuseppe La Napola (or Napoli) Jr. from Trapani; it was from La Napola that he acquired the systematic view of Scotism and the rudiments of the style he was to adopt in his own works. In November 1623, he was appointed Master of Studies (i.e., lector of logic) in Parma and in October of the following year Master of Studies in Bologna. In 1625, he was assigned as a student to the Collegio di S. Bonaventura in Rome. Here he struck up a lasting friendship with his confrère Bonaventura Belluto from Catania, with whom he was to share both his career and his published works for the next 13 years. Mastri and Belluto graduated from the Collegio di S. Bonaventura in 1628, with doctorate degrees and the plan to write a systematic course on Scotist philosophy.

From 1628 to 1631, Mastri and Belluto were regents of the Order's *studium* in the convent of St. Francis in Cesena, where they taught physics and metaphysics. From 1631 to 1638, they were regents of the Order's *studium* in Perugia, where they taught theology. In 1638, they were appointed regents at the Collegio di S. Antonio, in Padua, after a bitter clash for the control of these chairs between the highest authorities of the Order and two other members of the Order, Matteo Frée from Veglia (today Krk) and Francesco Maria Vaccari from San Giovanni in Persiceto, supported by some of the Veneto Senate. Mastri and Belluto kept these posts until 1641, when each returned to the convent of his hometown. After a few months, Mastri became private theologian to Cardinal Luigi Capponi in Ravenna. In 1645, Capponi left Ravenna to settle definitively in Rome, and Mastri returned to Meldola. In 1646, he ran the risk of being exiled from his hometown following a political clash he had become involved in, but the storm passed that year. In 1647, he was elected minister provincial for the province of Bologna. From 1650, the year that marked the end of his mandate, to 1659, he

was – as he himself writes in the preface to one of his later works – “almost a second Diogenes” in Meldola.

His frustrated longing for offices and honors was partly satisfied after Giacomo Fabretti from Ravenna, a friend of many years, was elected minister general of the Order at the end of May 1659. During Fabretti's generalate, Mastri often spent time in Rome. In the same year, he succeeded in personally offering the pope, Alexander VII, his most recent volume. In the second half of 1662, during a prolonged absence on the part of Fabretti, who was visiting the central European convents of the Order, Mastri became the minister general's vicar for Italy and the nearby islands for several months. In 1665, he did not succeed in having himself elected as the Order's minister general: Andrea Bini from Spello edged his way in between Mastri, supported by the fathers from Ravenna, and Lelio Spada, supported by the fathers from Faenza, and became the winning candidate. Bitter about the lost election, Mastri returned to Meldola. Here he worked on the completion of his last work and on the restructuring of the convent. He died in Meldola on 11 January 1673.

Works

Mastri was the author of four works. The first, in order of publication, was a *cursus* on Scotist philosophy articulated into logic, physics, anthropology, and metaphysics. It was planned and, to a great extent, drawn up together with his colleague, Bonaventura Belluto, from 1628 to 1646. It was published, divided by subject, in seven volumes in 4° from 1637 to 1647 and partly republished from 1644 to 1652 with integrations by Mastri alone. After the death of its authors, it was reprinted several times with the general title of *Philosophiae ad mentem Scoti cursus integer*. A second work, written in collaboration with his confrère and friend Ottaviano Camerani Jr. from Ravenna and directed against Matteo Frée, was published in 1650 in a single volume in 4° entitled *Scotus et scotistae Bellutus et Mastrius expurgati a probrosis querelis ferchianis*. A third work,

formally on theology but rich in philosophical elements, was published in four volumes *in folio* from 1655 to 1664. On the basis of some elements in the text, it is correct to indicate this work by the general title of *Disputationes theologicae in quatuor libros Sententiarum*. The last work published by Mastri is an extensive *Theologia Moralis*, printed in a single *in-folio* volume in 1671.

Philosophical and Theological Thought

Mastri intended to be a follower of John Duns Scotus and he undoubtedly was, to the extent that he can be held to be one of the most refined champions of *Doctor Subtilis* in the baroque age. Nonetheless, it would be incorrect to take his works as a simple exposition of Scotus' doctrine. Being a Scotist in the seventeenth century did not simply mean repeating and propagating the medieval master's doctrines. First of all, Mastri inherited a whole set of standpoints that were the outcome of three centuries of friction between Latin Aristotelians, nominalists, Scotists, and Thomists. In Mastri's day, there was a long history of the effects of Scotus' theories, and Mastri repeatedly recalls the long series of "interpreters" that had come before him. Moreover, what he proposed was fully immersed in the debate of his time within the context of the university, a debate that actively involved a great number of highly innovative authors, many of whom Jesuits, who cannot be traced back to a single traditional school. Lastly, Mastri was also well informed about the sixteenth-century and early seventeenth-century developments in empirical scientific research. He presented and evaluated these developments on the basis of the flimsy physical doctrines which were part of his own tradition and were acceptable to the Roman curia and Catholic theologians, but he also perceived with honesty that they were the results of competencies and instrumental abilities that he did not possess.

Mastri's vast work ranges from logic to metaphysics and from ethics to supernatural theology. On the whole, he created a synthesis of the views

of a minority line of Scotism – a line that dated back at least to Antonio Trombetta – and the positions of Francisco Suárez, elaborating it by means of a careful reading of Scotus' works and an extensive knowledge of the doctrines advanced by university-level thinkers, especially those from the first decades of the seventeenth century.

Following Zaccaria Pasqualigo's developments of a theory formulated by Peter Auriol, Mastri distinguishes between knowledge (be it a concept, a judgment, or a science) as a real state of the cognitive faculties and knowledge as cognitive content. Knowledge in the first sense is a real being (an accident, in the case of a finite cognitive faculty) and therefore can be more or less similar to the real being, or the set of real beings, to which it possibly refers. Truth consists precisely in this similarity. Knowledge in the second sense is what one bears in mind and considers. Actually, knowledge as a cognitive content is not something real: it is a representation, a pure "known," whose entire reality lies in the state of a cognitive faculty and in the extramental basis of this state. Between a state of a cognitive faculty and what consequently appears to it, there is a biunique and necessary connection; thus, the correspondence between knowledge taken as a real state of the cognitive faculties and knowledge taken as cognitive content occurs anyway and is always perfect. Moreover, this correspondence is not a similarity between two (or more) real things. Consequently, it is not what is called "truth" (be it the truth of a concept, of a proposition, or of a science). Due to the fact that a cognitive content is not a real being, no direct comparison can be established between it and the object that is known; conversely, the relationship between cognitive content and the object of which it is supposed to be the representation is mediated by the actual state of the cognitive faculties. Mastri does not consider the detachment of cognitive contents from the things as a simple limitation of the mind; indeed, he also considers it as an expression of the strength of the cognitive faculties, i.e., the mind's power to besiege and capture somehow the real beings it is confronted with.

As far as the nature of concepts (taken as cognitive contents) is concerned, Mastri

distinguishes between predicamental concepts (“finite being” included) and transcendental concepts (first of all, “being” taken as common to God and creatures). Mastri’s distinction is traditional, but his treatment of it is not. According to Mastri, predicamental concepts regard things not radically different from one another and such as can be made up of a potential principle and an active principle. This means that they always concern finite things. Consequently, predicamental concepts are adequate concepts, i.e., they are founded on a distinction endowed with reality independently of the work of the mind, and they can represent things as these things actually are. By contrast, transcendental concepts regard things radically different from one another of which at least one is infinite. This means that they always concern things of which at least one cannot be made up of a potential principle and an active principle. Consequently, transcendental concepts are inadequate concepts, i.e., they are founded on a simple embryonic likeness, which is conceived by the mind in the form of a conceptual content which appears as common to different things exclusively through the work of the intellect itself. In other words, transcendental concepts – and the concepts contracting them – are the objectified expression to the mind of the work performed by the mind itself in order also to grasp something that a finite mind cannot grasp as it is in reality. From a historical point of view, Mastri’s theory of transcendental concepts is an endeavor to identify a subtle middle way between nominalism, Thomism, and the Scotism professed by most of Scotus’ followers, in a field already crowded with attempts at mediation. As regards the formation of the *ratio entis* (i.e., the cognitive content “being”) and its contraction to infinite being and finite being, Mastri, against most Scotists, maintains that the *ratio entis* is formed not by the grasping of a *formalitas* (i.e., something real and possibly common to several individuals; in this case, something real and common to God and creatures), but rather by confusing abstraction; against the nominalists, he maintains that such abstraction takes place not by reasoning reason (i.e., by means of the sole work of the mind), but rather by reasoned reason (i.e., by means of a

work of the mind that is founded in reality); against both the nominalists and the Thomists (even the eclectic ones, like Francisco Suárez), he maintains that the *ratio entis* is contracted not by explicitation, but rather by composition; finally, against most Scotists he maintains that the composition in question is not a real one, but rather a composition of reasoned reason. Indeed neither transcendental being nor the modes contracting it, i.e., infinity and finitude, are representations of something existing as such in reality; nonetheless, the transcendental being, the mode of infinity, that of finitude, and the compositions of the former with the latter are the manifestations to the mind of the work with which the mind itself grasps reality, i.e., the infinite being, the finite being, and their actual likeness and difference. Consequently, being is neither perfectly univocal nor simply analogical. Mastri rejects the Thomistic theory of the analogy of being, i.e., the theory according to which, since the created being has a dependence on the supreme being, the human intelligence grasps that dependence, albeit in a confused way, as soon as it conceives being. According to Mastri, on the other hand, being is an absolute concept that also extends to God but in itself does not include an actual reference to God any more than it includes an actual reference to the creature. Thus, Mastri maintains that being is both univocal and analogical: it is univocal because, taken as distinct from its inferiors, its contractors do not induce any inequality in it; notwithstanding, it is analogical because, even if it is taken in a state of abstraction, it is intrinsically – although only potentially – orientated to being contracted to inferiors that are unequal in perfection and disposed according to a certain order. A final remark has to be made. Mastri distinguishes between extrinsic modes and intrinsic modes. Extrinsic modes are, actually, accidents; intrinsic modes are not accidents, and the distinction between intrinsic modes and what they modify is weaker than the distinction between extrinsic modes and what they modify. Notwithstanding, a clarification concerning intrinsic modes also has to be made. Intrinsic modes have the same nature as what they modify: if they modify something represented by a predicamental concept, they are

endowed with reality independently of the work of the mind; if they modify something represented by a transcendental concept, they are only manifestations to the mind of the work with which the mind grasps the difference between the things that are referred to by that transcendental concept.

In order to appraise Mastri's theory on being, his statements concerning the nature of the reality of real being should also be taken into consideration. Real being does not simply refer to existence and is not the same as actual being; in fact, it is the same as possible being. However, Mastri maintains that the possibility of possible being can be considered from two different points of view: as far as the rationale of possible being is concerned, possible being is possible just because of itself, whereas far as the foundation of possible being is concerned, possible being is possible only because it is grounded in God's science.

A well-known divergence between nominalists, Scotists, and Thomists concerns the nature of freedom. As far as the metaphysical side of this subject is concerned, Mastri – following his master, Giuseppe La Napola Jr. – rejects both Domingo Báñez's Thomistic theory and Luis de Molina's Ockhamist doctrine: the contingency of contingent futures is founded neither on God's almightiness nor on God's sublime knowledge; it is founded on the supereminent freedom of God's will, which virtually holds and renders all possible created acts of free will. As far as the anthropological side of freedom is concerned, Mastri states that it consists of the dominion of the will over one's acts. This dominion exists both with respect to the intellect, which has a merely advisory power, and with respect to the object, which is merely the extrinsic formal cause of the choice. Indeed, the will dominates the very exercise of its act. This, writes Mastri, explains the fundamental reason for rejecting the Thomists' attempt to demonstrate a priori the freedom of the will on the basis of the fact that some objects are such as not to attract it necessarily: no object is such as to attract the will necessarily; hence, freedom can be demonstrated only a posteriori.

As far as the nature of morality is concerned, Mastri writes that moral goodness consists in the conformity between rational nature and the object

of a certain act. A few considerations must be added to this definition, however. First of all, the object in question is one of the extremes of the relation of conformity not for what that object is in reality, but rather for what it is in the mind; secondly, the moral quality of an object is decided not simply by its own nature, but rather with reference (i.e., subordinately) to a rule, that is, a law. By means of this doctrine, Mastri attempts to take into account the multiple moments of moral activity that do not simply mirror real connections. The object whose conformity to the norm must be judged is a cognitive content; moreover, the judgment on the conformity between norm and object is also the work of the mind, which, when judging, has to take into account a plurality of factors and the concrete possibility of making a mistake. Furthermore, Mastri holds that at least some norms – including some divine norms – are arbitrary or conventional. These considerations do not lead Mastri to deny the existence of a connection between obligation, rational nature, and the nature of things; nevertheless, he puts forward a refined conception of the connection in question. Firstly, the metaphysical concept of "end" can be employed to found morality only to the extent to which it becomes a "duty," a step that requires the introduction of the concept of law. Secondly, he transposes the scheme that he uses regarding the distinction between nature and foundation of possible beings to possible moral objects: the rationale of the goodness of objects that are good depends on the objects themselves, but the foundation of that goodness lies in God's law.

As far as supernatural theology is concerned, Mastri denies that, for the *viator*, theology is a science: its principles are not evident to the theologian; thus, it lacks one essential requirement for science. Notwithstanding, he also denies that theology is a form of opinion. Theology, Mastri argues, is explicit faith; but faith is certain and is a constant and reasonable state of man; therefore, theology also possesses the same degree of certainty and reasonableness as faith. To this must be added the fact that theology does not coincide, even partially, with philosophy: even though some theological truths are materially identical to some philosophical truths, the reason for assent

is, in the two cases, formally different. Mastri's theory on the nature of theology clearly opposes the Thomistic one, and indeed we can find the same opposition on a number of other issues. According to Mastri – and to Scotists in general – justification consists of a state of friendship between man and God. According to the Thomists, grace is an accident whose very physical nature makes it capable of uniting man to God. Like all Scotists, Mastri holds such a thesis to be untenable: as a created accident, grace has no connection in its being with God; hence, grace is not able, of itself, to produce any real unifying effect. It follows from this that the reason for the effectiveness of grace lies elsewhere. Grace unites God and man not because of what it is in its being, but rather because of a free divine decision: the decision to accept as a friend he who possesses that quality. Nonetheless, the presence of this quality is both insufficient and, absolutely speaking, unnecessary.

Impact and Legacy

Although at the present state of research it seems that, outside the Catholic clerical milieu, the work of Mastri and Belluto enjoyed little fame, inside that environment its diffusion was significant and long-lasting. In the 1660s and 1670s, the Sicilian Capuchin Illuminato Oddo declared his allegiance to them. After Mastri's and Belluto's death, their *Philosophiae ad mentem Scoti cursus integer* was reprinted six times, Mastri's *Disputationes theologicae in quatuor libros Sententiarum* was reprinted six times too, and Mastri's *Theologia moralis* even saw seven reprints. As late as 1750, Veremund Gufl, a Bavarian Thomist Benedictine, though rejecting Scotism, presented this school relying on Mastri and Belluto's work. However, one should not believe that Mastri's interpretation of Scotus' thought was accepted without opposition. As stated above, this interpretation was a synthesis of the views of a minority line of Scotism and the positions of Francisco Suárez. Already during his lifetime, Mastri was attacked both by "orthodox" Scotists such as the Conventual Franciscan friars Francesco Pontelongo, Alessandro Rossi, and

Bonaventure Columbi and by the conceptualist Recollect Franciscan John Punch. After his death, Mastri was once again criticized by the Spanish Observant Franciscan Manuel Pérez de Quiroga, who published his works in the early decades of the eighteenth century, and, in the 30s and 40s of the same century, by the Austrian Reformed Franciscan Crescentius Krisper. Nevertheless, within the Conventual Franciscan Order, Mastri's thought met with increasing approval, reaching the height of its fame in the 1750s.

Heritage and Rupture with the Tradition

Like any time in the history of philosophy, the Renaissance is a period rich with speculations about the nature of matter, the function it performs in natural changes, and whether it can be known directly, if at all. During the Renaissance, philosophers from diverse traditions generally embraced a hylomorphic framework based on the writings of Aristotle, along with the passive role it assigns to matter. But there was no, of course, universal agreement about the nature of matter, and Renaissance philosophers modified long-standing views. The revival and rediscovery of new ancient philosophical sources – in particular, Plato’s natural philosophical dialogue *Timaeus* and Lucretius’ Epicurean poem *On the Nature of Things* – further complicated traditional theories of matter, and this resulted in criticisms and revisions of hylomorphism, as well as the development of rival frameworks for thinking about matter and physical bodies.

During the fourteenth and fifteenth centuries, philosophers conceived of primary substances along broadly hylomorphic lines, and this is true of both Platonists and Aristotelians. According to hylomorphism, primary substances are composed of three basic principles – matter, form, and privation. Matter is the passive substratum of form. Form is the active principle that makes something what it is, renders it knowable, and is responsible for a substance’s powers. Privation is what a substance could reasonably become when a change occurs. Prime matter is without any form whatsoever, whereas secondary matter is not without form, but is the substratum relative to the level of organization under consideration. While there was widespread consensus regarding these basic principles from antiquity to the Renaissance, philosophers disagreed for a long time over significant metaphysical and epistemological details. Some held that matter is nothing in itself beyond pure potentiality, while others assigned a degree

Matter in Renaissance Science

Abstract

During the Renaissance, philosophers inherited and modified traditional hylomorphic views on matter. Others were harsh critics of the hylomorphic tradition and proposed entirely new theories of matter. This article considers the theories of matter of Marsilio

of reality to matter in itself. Further, some held that matter can only be known indirectly, while others claimed that it is, at least in principle, knowable. Dominican philosophers, following the work of Thomas Aquinas, generally held that matter is entirely parasitic on form for its existence and that it is entirely unknowable in and of itself. Franciscans like Duns Scotus maintained that matter has a robust existence that is independent of form and further that matter can be known, at least in principle. In addition, philosophers, drawing on elements of Stoicism and the writings of Augustine, argued that matter itself is a seedbed that contains seminal reasons of all things.

Renaissance philosophers inherited these ancient and medieval debates, contributed to them, and in time diverged widely from traditional hylomorphic views. The Florentine Platonist Marsilio Ficino (1433–1499) generally assumes the basic elements of hylomorphism, but he makes some unique modifications that are rooted in his Platonism. Ficino holds a robust or thick view of matter according to which prime matter possesses “absolute existence” that is independent of form because it is created directly by God and that matter is at least in principle knowable, if only to God. In this way, prime matter is more real than the secondary matter that composes ordinary objects. Further, Ficino also argues that matter itself contains the forms of all things in some inchoate form, and he frequently describes matter as pregnant and fermenting with forms. Ficino argues that natural changes happen “from within” matter, rather than being imposed on it from the outside. Genuine causation, according to Ficino, occurs from within matter itself, while apparent causation occurs from the outside. Bernardino Telesio (1509–1588) was a critic of traditional Aristotelian views of matter, and he argues for the return to a more empirically grounded metaphysics. Telesio argues that all of the natural world is the result of two principles – passive matter and active force – which he identifies with heat and cold. Giordano Bruno (1548–1600) inherits some of Ficino’s ideas on matter but goes further in his criticism of Aristotle

and his revision of traditional hylomorphic views, especially regarding matter’s passivity. In his early works, Bruno engages with atomistic speculations about the nature of matter. Bruno argues that ordinary physical objects are aggregates of atomic particles that are themselves simple and immutable. Atoms require the animating force of soul and the ordering design of mind. In later works, Bruno holds that matter itself is active, and like Ficino he argues that matter contains within itself the forms of all things, both material and incorporeal. Bruno was also attracted to elements of materialism. Like Telesio and Bruno, Tommaso Campanella (1568–1639) is a critic of traditional Aristotelian views of matter. However, Campanella diverges from earlier Renaissance thinkers insofar as he denies a robust existence of primary matter and instead identifies matter with body. Furthermore, Campanella stresses the general passivity of matter and that it receives forms from external causes.

Abstract

Pietro Andrea Mattioli was a physician known for his abundant activity of translation of, and commentary on, the most important work on medical botany and materia medica of classical antiquity, *De materia medica* by the Greek Dioscorides (first century AD). After a first, modest, translation of the work into Italian, he rendered it into Latin in 1554 and compiled a commentary that he constantly expanded, producing repeated augmented editions. In 1555, he added small illustrations into the work, which he transformed into large ones covering most of the pages in 1562. His work was translated into Czech and German and was constantly expanded until Mattioli's death. After a further posthumous edition in 1598 (*Opera omnia*), the work became obsolete. Mattioli's method consisted not only in constantly deepening the analysis of the text with particular attention to the identification of Dioscorides' plants, but also in aggregating plants not described by Dioscorides to those present in *De materia medica*. To this end, he proceeded by similarity in the general appearance of the plants. However productive it might have been, this method resulted in obscuring the classification system adopted by Dioscorides, to the collapse of which Mattioli's work contributed in a paradoxical way.

Biography

Pietro Andrea Mattioli was born in 1501 in Siena. Together with his family, he moved to Venice where his father practiced medicine. He was sent to Padua, to study first classical languages (Greek and Latin) and, further on, medicine. After he graduated in 1523, he returned to Siena and practiced medicine, first in Perugia where he made some surgery, and, afterward, in Rome, where he devoted much attention to treat patients suffering from syphilis. On the basis of this experience, in 1528 he wrote a small book on syphilis which he published in 1533 in Bologna (*De morbi gallici curandi ratione*). In 1527, he left Rome and went to northern Italy where he practiced medicine. He first stayed in Trento until 1539, moving then to Gorizia where he remained until 1554. He was then called to Prague to become a physician to the court, first under Ferdinand I (emperor 1558–1564) and then under Maximilian II (emperor 1564–1576). In 1570, Mattioli left the imperial city and returned to Trento, where he died of plague in 1578 (Ferri [1997](#) and Fausti [2004](#)).

Heritage and Rupture with the Tradition

Mattioli devoted most of his life to studying, translating, and commenting on the most important work on materia medica compiled in antiquity, the treatise traditionally identified as *De materia medica* by the Greek Dioscorides (first century AD). This is a vast encyclopedia of all the natural substances (plants, minerals, animals and their parts, as well as some handmade products) used as ingredients for the preparation of medicines.

In Mattioli's time, the work was fashionable. Whereas the Late Middle Ages knew only the Latin translation made by Pietro d'Abano (ca. 1250–1315 or 1316) in which the materia

medica were ordered according to the alphabetical sequence of their name, the Renaissance returned to its Greek text. Ermolao Barbaro (1453–1493), who owned at least one Greek manuscript of the work and consulted others, translated it into Latin, and abundantly commented on it. However, he could not publish the work, which remained in manuscript form until 1516. In 1499, Aldo Manuzio (ca. 1450–1515) published the first printed edition of Dioscorides' text in Greek, most probably in collaboration with Nicolò Leonicensio (1428–1524). The text of this Aldina edition was translated into Latin by the French naturalist Jean du Ruel (1474–1537), who published it in 1516 in Paris. The same year Ermolao Barbaro's nephews (who were also his heirs) published their uncle's translation, irritated by Ruel's translation which deprived Barbaro of the merit of being the author of the first Latin translation of Dioscorides made on the basis of the Greek text. Two years later (1518), the heirs of Aldo Manuzio published the so-called second Aldina of *De materia medica*, and, the same year, Marcello Virgilio Adriani (1464–1521), successor of Poliziano in Florence, published another Latin translation of *De materia medica* in prose that reminded that of Celsus. In 1529, the study and publishing works on Dioscorides moved northward. The German erudite Johannes Heyl (better known as Soter) published the Greek text of *De materia medica* together with Adriani's translation in Cologne, while in Basel, Janus Haynpoel (who Latinized his name in Cornarius) (ca. 1500–1558) published another Greek text of Dioscorides. During these years, Ruel's translation was frequently reprinted.

In this climate of abundant production and sharp competition, Mattioli translated *De materia medica* into Italian, publishing the first version of this translation in 1544. With it, he moved the epicenter of Dioscoridean studies back to Italy, as the book was produced in Venice and it was not in Latin, the international language of science, but in Italian. Although a modest work, this translation drew much attention and triggered a series of mechanisms that Mattioli deftly exploited, transforming a scientific endeavor into a profitable business (Pesenti 1985).

Impact and Legacy

The success of the 1544 Italian translation apparently came as a surprise. Mattioli reprinted the work in 1547 and published a second edition in 1548, which was followed by a third as early as 1550. Interestingly, the first edition (1544) was reproduced in an unauthorized printing in 1549, and the third was reprinted as early as 1551. Mattioli transformed soon this initial work into a scientific enterprise that kept him busy for his whole life. In 1554, he translated *De materia medica* into Latin, with a substantial commentary. Possibly walking in the footsteps of the German botanists and publishers who specialized early in the production of illustrated herbals, Mattioli added small representations of the plants for the production of which he hired the Italian illustrator Giorgio Liberale of Udine (1527–ca. 1579).

From Gorizia and, further on, Prague, Mattioli requested plants and seeds or, in absence of those, information from all botanists, physicians, and scientists, inundating Europe with his letters and actively animating the Repubblica delle Lettere instead of herborising according to the Padua model, or traveling as other botanists started doing. In letters also, he attacked his colleagues who dared to criticize his identifications of the plants mentioned by Dioscorides, often accusing them of plagiarizing him and profusely insulting them in virulent missives aimed to defend his own theses *coûte que coûte*.

As a result of this extensive search, Mattioli regularly published augmented editions of the translation and the commentary, which constantly generated a demand. The success of the work also generated a French translation as early as 1561 and, further on, multiple unauthorized editions, mostly in Lyon.

Probably encouraged by the success of the work and certainly supported by funding provided at the imperial court in Prague, Mattioli transformed again the enterprise by adding large illustrations of the plants that covered almost all the surface of the pages. The artist was again Giorgio Liberale and the cutter Wolfgang Meyerpeck

(1505–1578). These new illustrations were first used in the Czech version of Mattioli's work published in 1562 (which was in fact a translation of Mattioli's Latin into Czech), followed by a version in German in 1563 and in 1564 a Latin version. Several editions and reprints, including unauthorized ones, followed (an accurate census and analysis of which is still lacking), even after Mattioli's death, with a cumulative edition of all Mattioli's works in his *Opera quae extant omnia* edited by Caspar Bauhin (1560–1624) and published in Frankfurt in 1598.

In constantly adding new information and also introducing new plants in his commentaries Mattioli faced a crucial taxonomical problem since several of the plants he mentioned were not present in Dioscorides' work. Mattioli proceeded by general similarities (grouping, for example, the banana tree with the palm tree on the basis of the similarity of their leaves stressed by the illustration). However apparently botanically sound and, in any case, productive this method might have been, it obscured the structure of Dioscorides' taxonomy. In the preface of *De materia medica*, Dioscorides specified that he wished to depart from the traditional usage of classifying plants according to the alphabetical order of their name; instead, he used a classification (*taxis* in Greek), of which however he did not specify the exact nature. Analysis of the text brings to light a classificatory system combining different parameters, mainly a hierarchical scale (cosmological in nature) based on the values attributed to the plants, the types of plants, their therapeutic action, and also possible structural characteristics and similarities. By introducing similar species into such a complex system, Mattioli obscured Dioscorides' system, all the more because such a system was not easily perceptible. Although he expanded Dioscorides' work, Mattioli collapsed its taxonomical system, contributing to making Dioscorides obsolete as early as the end of the sixteenth century. Significantly enough both the first edition of Mattioli's *opera omnia* and the last Renaissance edition of *De materia medica* were published in 1598, closing a century of humanistic science and relegating both Dioscorides and Mattioli's works to the history of science.

Abstract

Maximus the Greek was a monk, theologian, scholar, and translator active in Greece and Russia. He is considered a pioneer of Greek

letters after the fall of Constantinople. He dedicated his life to the promotion of theology and education in the Slavic territories. He was associated with some of the most famous and influential Italian humanists of his time. He suffered persecutions from ecclesiastical and secular authorities because of his views and his work. After his death, the Eastern Orthodox Church proclaimed him a saint and he is commemorated on January 21.

Biography

Maximus was born as Michael Trivoles in Arta. His family came probably from Mystras, in Southern Greece. It is indicative that he signed his works as Maximus Grecus Lakedaimon, e.g., from Lakonia, the era around ancient Sparta. In his youth, after the Turkish invasion of Epirus, he moved to Corfu. His first teacher was John Moschos, a scholar known for his hostility to the Catholic Church. He continued his studies in Italy, namely, Padua, Vercelli, Bologna, and Florence. In Florence, he studied for 3 years under Ianos Lascaris. At the same time, he was associated with Marsilio Ficino and took part in the activities of the so-called Platonic Academy. For a short period of time, he worked for Giovanni Pico della Mirandola who was interested in classical and patristic Greek texts. Among Maximus' acquaintances were the famous humanists Angelo Poliziano, Scipio Callerges, and Aldo Manutius. While he was staying in Florence, Maximus fell under the influence of the Dominican friar Girolamo Savonarola, who shook Florence from 1494 to 1498. Maximus admires the friar's preaching and ascetic lifestyle. Throughout his life, Maximus showed his deep respect for Savonarola and attempted to promote his ideals and views about indigence. After Savonarola's death, Maximus worked for Aldo Manutius copying and editing texts. In 1502, with the encouragement of

the cardinal Oliviero Carafa, Maximus entered the Dominican order and became a cadet monk in the monastery of San Marco. In 1503 or 1504, he left the Dominicans, and in 1505 he chose to move to the monastery of Vatopedi at Mount Athos. He took the monastic vows and was named Maximus. His decision marked a shift in his interests and priorities. He adopted the ideals of Athonic monasticism and opposed classical Greek and humanitarian letters, despite his former education. Maximus studied carefully the Greek Patristic tradition. When Tsar Basil III asked for a translator of the Holy Bible and the Patristic literature, Maximus was chosen, even though he did not know any Slavonic language, but because he was esteemed for his theological and philosophical background. Moreover, monk Sabas, an expert on Slavonic languages, refused to go to Russia because he was too old. Maximus went to Constantinople and in 1518 he arrived in Moscow. Because he did not speak any Russian, he translated everything from Greek into Latin, and his associates would then translate that into Russian, a language that was not rich and fully articulated so as to render in highly sophisticated texts. As a result, Maximus' translations were not accurate. Furthermore, Maximus supported the coenobitic monastic life and indigence. Because Russian church authorities showed a tendency toward luxury, Maximus became the leading figure of a group of monks who intended to reform the Russian Church and threatened its autonomy. His writings and actions provoked the hostility of the leading figures of the Russian Church. Maximus was prosecuted and condemned in 1525 and 1531. The authorities accused him of heresy, magic, and treason. Maximus replied that the mistakes and misinterpretations in his works were the outcome of his poor knowledge of Russian. As for magic, in his works he repeatedly wrote against astrology and magic. Maximus supported that the Russian Patriarchate should come under the Patriarchate of Constantinople and disapproved of the politics of friendship between the Ottoman Empire and Russia. Despite the pleas of several Orthodox Patriarchs to the Russian ecclesiastical and political authorities, Maximus was never allowed to return to Mount Athos. In the last years of his life, he received permission to study and write.

Innovative and Original Aspects

Maximus could not accept Russian Church's voluntary alienation from the Byzantine Orthodox tradition. When he was called to Russia, he intended to revive the Byzantine tradition and bring together the Greek-speaking Orthodox and the Russian people in order to confront the Ottoman threat. His work is vast and includes 365 treatises. His polemical works, against the Latins, prove his disapproval of nominalism. Instead, Maximus preferred to study the Christian dogma based on the Holy Bible and the Patristic texts. Maximus blamed the Latins that they care excessively for philosophy and rational syllogism. They taught Plato and Aristotle almost exclusively, and they did not accept anything that did not comply with Aristotelian logic. They were prone even to adjust and paraphrase the Christian dogma in order to be consistent with science. Maximus expressed his annoyance at the fact that in Western universities some professors instructed their students in Averroism, namely, the mortality of the personal soul. Maximus did not reject totally science and philosophy. He admitted that they serve as a preparatory stage for the study of theology, and they offer their vocabulary, which is indispensable for the right wording of the Christian truths. Philosophy has value per se, but it should not be connected to the core of the Christian dogma. Representative of his views is his treatise "Against the Errors of the Hellenes." Maximus was still under the influence of Savonarola's ideas. He was afraid that Renaissance classicism would affect Russia and would alienate Orthodoxy. Despite his studies in philosophy, he did not accept to be called philosopher by his contemporaries. Instead, he preferred to identify himself as a monk. Philosophical theology was not appealing to Maximus. Moreover, he remained faithful to the Greek tradition and did not approve *disputatio* as the most effective educational method. Instead, he argued in favor of the Platonic method, which consists of questions and answers between teacher and students. At the same time, Maximus rejected the attempt of certain scholars, like Pletho and his followers, to Hellenize Greek culture. He equated Hellenization with idolatry. Maximus disapproved of the attempts to

compromise the Orthodox and Catholic Church on the thorny issue of the filioque. This is the main reason for his harsh critique of Augustine, whom he considered the main cause of the problem. We have to admit that his arguments are poor; he mainly insisted that the theologians should rest only on the positions of the Holy Fathers. Despite the contacts of Greek Orthodox and Lutherans, which were cordial in the sixteenth century as a result of their opposition to the Pope, Maximus was the first Greek theologian who argued against the Lutherans, although his goals and intentions are not easily discernible. In his works concerning political thought, he supported the primacy of the spiritual over secular authorities.

Impact and Legacy

Maximus' work was not really influential in its totality. Besides his circa hundred translations, he wrote some 250 treatises on philology, ethics, theology, politics, and social questions. He was a distinguished ethicist and not a theologian. He supported Greek theology from everything he considered a threat. His familiarity with three different cultures and traditions, namely, Greek, Russian, and Slavonic, enhanced his reputation in a large part of Europe. He gave primacy to Greek culture and frequently criticized the other two.

Abstract

Jacopo Mazzoni was an Italian philosopher, humanist, and astronomer. He held the chair

of philosophy in Macerata, Pisa, Rome, Ferrara, and Venice. He is mostly remembered for his defense of Dante Alighieri (*Della difesa della Comedia di Dante*, Cesena, 1587), which was the occasion to expound his reflection on poetics and aesthetics. Mainly inspired by Aristotle and Plato, his philosophy is motivated by a conciliatory project. He also authored a comparative study on the philosophies of Plato and Aristotle, defending Aristotelian geocentrism (*In universam Platonis et Aristotelis philosophiam preludea*, Venice, 1597). Upon the publication of this work, he exchanged letters with Galileo Galilei, whom he had met during his appointment in Pisa. Galileo's letter to Mazzoni of May 30, 1597 represents the earliest attestation of Galileo's engagement with Copernicanism.

Biography

Mazzoni was born on November 17, 1548, in Cesena, from Battista, senator, and Innocenza Masini. He carried out his studies in Padua (1563) with the Aristotelian philosopher Federico Pendasio. Having come back to Cesena after the death of his father to take care of the interests of the family (1637), he frequented the Accademia dei Riformati. In 1672, he published in Cesena his first work, *Discorso de' dittonghi*, responding to a polemic on the pronunciation of ancient diphthong. In the same year, he published, under a pseudonym, and the year after (1673), under his own name, the *Discorso in difesa della Comedia del divino poeta Dante*. This work was a response to a criticism of Dante Alighieri's *Comedy* (*Discorso di M. Ridolfo Castravilla nel quale si mostra l'imperfezione della "Commedia" di Dante contro al "Dialogo delle lingue" del Varchi*), written by a Ridolfo Castravilla, probably the pseudonym of a yet unidentified author, whose manuscript was handed to Mazzoni by Tranquillo Venturelli, to be then published only in 1608. In 1574, Mazzoni was invited at Urbino by Bourbon Del Monte, where he met Torquato Tasso, who then mentioned the conversation he had with Mazzoni in his *Apologia in difesa della sua*

Gierusalemme liberata (Ferrara, 1585). Back in Cesena in 1574, Mazzoni started to give substance to his all-encompassing and conciliatory philosophical program with the publication of *De triplici hominum vita, activa nempè, contemplativa, et religiosa methodi tres, quaestionibus quinque millibus, centum et nonagintaseptem distinctae. In quibus omnes Platonis, et Aristotelis, multae vero aliorum Graecorum, Arabum et Latinorum in universo scientiarum orbe discordiae componuntur* (Cesena, 1576), where he addressed 5197 philosophical questions. For the discussion of the theses, which took place in Bologna in 1577, Mazzoni had to take a degree in theology (1577). In the following years, Mazzoni engaged in a project of commentary on Plato's *Republic* and became a member of Congregazione dell'Indice. As his previous *Discorso* in defense of Dante was triggering a debate, especially with the writings of (Alessandro Cariero, 1582) and (Bellisario Bulgarini, 1583) Mazzoni composed, starting from 1583, a defense of Dante (*Della difesa della Comedia di Dante. Distinta in sette libri. Nella quale si risponde alle opposizioni fatte al Discorso di m. Iacopo M., e si tratta pienamente dell'arte poetica e di molt'altre cose pertinenti alla philosophia, et alle belle lettere*), which also witness his more general engagement with poetics and aesthetic theory. Mazzoni managed to publish only three of the seven volumes he had planned in 1587 in Cesena, while the whole work will only be published in 1688. He then taught philosophy in Macerata (1587), and then Aristotelian and Platonic philosophy in Pisa (1588–1597), where he was invited by the grand duke Ferdinando de' Medici. His studies on Aristotle and Plato brought to the publication of *In universam Platonis et Aristotelis philosophiam praeludia, sive de comparatione Platonis, et Aristotelis liber primus* (Venezia, 1597). This work triggered the interest of a young Galileo, first a student, then a professor in Pisa, who wrote him a letter (May 30, 1597) in defense of the Copernican system. Appointed professor in Rome at *La Sapienza* by Clement VIII, he was then appointed by the Pope as ambassador in the attempt, carried on by the Papal States, to reconquer Ferrara and gain the neutrality of the

Venice Republic in the conflict. He was then appointed reformer of the University of Ferrara. Stroke by a disease, Mazzoni died in Cesena on April 10, 1598.

Heritage and Rupture with the Tradition

Though containing elements of originality, Mazzoni's thought was well-grounded in the themes and controversies of his time. His *De triplici hominum* reveals his engagement with a conciliatory vision of the philosophical endeavor, which finds reference in thinkers such as Pico della Mirandola and Nicolas of Cusa. It is innovative his approach to the comparison of the philosophies of Plato and Aristotle in *In universam Platonis et Aristotelis philosophiam praeludia*, where, on philological basis, Mazzoni argued for a Platonic phase in the development of Aristotle's philosophy and theorized the application of mathematical tools to the study of physics – which arguably triggered the interest of Galileo.

Innovative and Original Aspects

Particularly originals are also his works on Dante's poetic. In the *Discorso*, Mazzoni defended poetry as a topic for philosophical discussion. He also endeavored to show, against Castravilla, that Dante's *Commedia* could be framed within the prescriptions of Aristotle's aesthetics. On this basis, he described Dante as a comic poet, and not, contra Castravilla, as a satirist. In the *Della difesa della Comedia di Dante*, in addition to defending Dante, Mazzoni developed his own view on aesthetics and poetics, drawing not only from Plato and Aristotle but also from ancient rhetoric. He claimed that arts are distinguished into three kinds, according to the objects they refer to: "ideas," proper of "commanding arts"; "works," characterizing craft, and "idols," proper of "imitating arts." Mazzoni individuated the subject of arts not in the truth, but in what is "believable," thus arguing that poetry, insofar as it fabricates its own subject shall be understood as part of sophistic, whereas, if it judges its subject

without inventing it, it is poetry properly said, and, as such, part of the “commanding arts.” On these bases, he argued that Aristotle’s *Poetics* is to be understood as the last book of his *Politics*.

Impact and Legacy

The interest of the young Galileo for Mazzoni’s approach in the mathematization of physics (along with his disagreement with geocentrism) has been already mentioned. In *universam Platonis et Aristotelis philosophiam praeludia* shall probably be accounted as an important source for the formation of Galileo’s later thoughts. But it is surely Mazzoni’s poetics and aesthetics, as well as his interpretation and defense of Dante’s work, that exerted a lasting influence, as evidenced by the number of editions and reprints of his *Discorso* and *Della difesa della Comedia di Dante* up to the nineteenth century.

Mechanics in Renaissance Science

Abstract

The modern science of mechanics – a mathematical discipline – appeared during the sixteenth century at the crossroads of the increasing transformation of the mechanical arts and the humanist recovery of ancient and medieval textual traditions. Unlike other mixed-mathematical sciences such as astronomy and optics extensively developed during the medieval Latin West, the science of mechanics did not have clear medieval precedents. Consequently, intense debates and controversies forged mechanics as a mathematical science by borrowing elements from conflicting textual traditions, the expansion and transformation of the mechanical arts, the reconfiguration of disciplinary boundaries in mathematics and natural philosophy, and the possibility of incorporating this science of machines into existing taxonomies of knowledge – including their institutions (monasteries, universities, courts). By the sixteenth century, the science of mechanics was often portrayed as formulating the mathematical principles of the design and construction of machines, thereby dealing with artificial objects whose operation run against natural order to satisfy human needs. Mechanics was therefore seen as compatible with Aristotelian divisions of sciences. However, by the second

half of the seventeenth century, the vast expansion of mechanics had reached themes and problems considered for centuries as territory of natural philosophy, particularly the motion of bodies whose explanation then became increasingly intertwined with emerging mathematical techniques – from infinitesimals to calculus. Mechanics then acquired a more general dimension as a mathematical science of motion. During the seventeenth, the codification and adaptation of mechanics into a mathematical science of motion provided materials for and stimulus to new cosmologies which attempted to replace Scholastic natural philosophies and naturalistic cosmologies of the Renaissance.

Heritage and Rupture with Tradition

The expression “science of mechanics” may suggest that during the Renaissance, mechanics was a consolidated discipline similar to natural philosophy or astronomy, with continuous traditions going back to ancient writings through medieval elaborations, integrated into institutions of learning and teaching, including doctrines and procedures shared by networks of mathematicians. But the ancient trends in mechanics did not last for long; during the middle ages, mechanics did not have a community of practitioners or an institutional place in the medieval structures of knowledge (Clagett 1964). It was in sixteenth-century Italy that the classical meaning of mechanics – as a mathematical knowledge of the properties and functions of machines – was revived following ancient and medieval trends, during debates on the nature and scope of mechanics, mostly driven by interests in explaining the success of the mechanical arts.

This recovered meaning of mechanics as science was different from but emerged in close connection with a widely extended but vague use of the term to make reference to the *mechanical arts* – practical or manual activities, such as architecture, hydraulics, gunnery, surveying, among others (Bennett 2006). Most of these mechanical arts gained a considerable social

reputation since the fifteenth century, especially in Italy, where the possession of war engines and the fortification of cities could tip the balance in the conflicts that spread over the peninsula in the so-called Italian wars (Wolfe 2004). At the same time, changes associated with the growth of urban centers and the exploration of territories unknown by Europeans put considerable pressure on the manual activities and their practitioners (Feldhay 2018). In other sixteenth-century centers of power, such as Spain, the concerns with navigation, cartography, nautical astronomy, and engineering, central to the colonization of the “New World,” were institutionalized in the Academy of Mathematics of Madrid with considerable royal support (Navarro-Brotos 2008). Furthermore, the possession and exhibition of curious artefacts, such as theatrical machines, automata, fountains, or monumental clocks, increased the prestige of the competitive rulers and aristocrats and, therefore, skillful artists and engineers were progressively demanded and relocated from one court to the other all over Europe (Galluzzi 1996; Biagioli 1993).

It was the introduction and spectacular development of the printing press – a mechanical technology – that rendered ancient and medieval textual traditions on mechanics and motion widely available (Laird 1986; Richardson 1994). The recovery, translation, and appropriation of these sources, in the light of the practical concerns of humanists, engineers, and mathematicians, originated the modern science of mechanics. Four traditions – Aristotelian, Archimedean, Alexandrian, and the *scientia de ponderibus* – provided elements for debating the nature and scope of theoretical knowledge of machines and equilibrium. Because mechanics came to deal with motion as well, it is worth mentioning some medieval elaborations that involved natural philosophy, mathematics, and logic in the study of motion during the thirteenth and fourteenth centuries. These traditions became influential for the emergence of the science mechanics, although they were formulated in the context of natural philosophy (Murdoch and Sylla 1978).

The Aristotelian tradition goes back to the *Mechanical Problems*, attributed to Aristotle

(384–322 BCE) but now widely considered a product of his followers (Van Leeuwen 2016). The text is made up of an introduction, noticeably discussed in the Renaissance, and 35 problems; some are daily-life puzzles, while others are more theoretical in nature. The work claims that the geometrical properties of the circle explain the operation of the balance, considered as rotating around its fulcrum. This analysis of the balance is then used for establishing the doctrine of the lever, whereby the author solves some of the 35 problems, including how the operation of specific machines may be reduced to the geometrical properties of the circle. The work presents questions and solutions, not a systematic treatment of mechanics, and the remarks on the nature of mechanical knowledge are general and open to multiple interpretations –as Renaissance scholars found out. Two aspects of the *Mechanical Problems* were notorious in the Renaissance revival of the work: the causal character of its solutions, which provided a theoretical pattern for solving mechanical questions emerging in the Renaissance, and the inclusion of motion in the geometrical account of machines (Schiefky 2009). At the end of the fifteenth century, the text became extensively available as part of the edition of Aristotle’s works by Aldus Manutius; in the next two centuries, the text was edited, commented on, and translated into different languages (Rose and Drake 1971).

The second ancient tradition comes from the works of Archimedes on mechanics (287–212 BCE). In *On the Equilibrium of Planes*, Archimedes presented an axiomatic theory of the balance and provided proof of the law of the lever based on the notion of center of gravity –that is, in terms of equilibrium, not of motion. In *On Floating Bodies*, he stated the principles of hydrostatics and examined the behavior of bodies in fluids. This treatise also contains the famous “Archimedes principle,” whereby a body in a fluid receives an upward thrust equal to the weight of the volume of the displaced fluid (Bertoloni Meli 2006). Although some works of Archimedes were known to the Arabs and the Byzantines in the middle ages, he was mostly reputed as a builder of machines (Laird and Roux 2008).

However, the translation and circulation of Archimedes' mechanical treatises offered the Renaissance humanists and practitioners a more systematic and mathematical approach to the science of mechanics than *Mechanical Problems*. During the sixteenth and seventeenth centuries, these mechanical treatises were initially published by Niccolò Tartaglia and subsequently improved by Federico Commandino and Guidobaldo del Monte.

The Alexandrian tradition was known through Pappus' *Mathematical Collections* (third century CE), a work that attempted to arrange the existing knowledge on mathematics, including Pappus' own developments and insertions in order to provide an organized view (Laird 2001). Pappus' work received significant attention during the sixteenth and seventeenth centuries; it was seen as a source containing vestiges and clues of valuable earlier knowledge lost. The Book VIII of the *Mathematical Collections* deals with mechanics. Pappus incorporated some extracts of a lost treatise on mechanics by Heron concerning the five simple machines (lever, wheel and axle, pulley, inclined plane, wedge, screw). There, he also offered a definition of center of gravity – lacking in Archimedes – and, following Heron, considered all machines as reducible to the five simple machines which, at their time, could all be explained by the geometrical analysis of the lever. This reductionist view of machines encouraged a programmatic orientation in some Renaissance scholars and practitioners, notably in Guidobaldo, who supervised the edition of Commandino's translation of Pappus in 1588 (Bertoloni Meli 1992).

The last textual tradition concerning mechanics was the *Scientia de ponderibus* or "The Science of Weights" in medieval Europe. This tradition emerged in the thirteenth century from Greek and Arabic sources and provided mathematical analyses of the balance and the lever, mainly concerned with equilibrium – although some proofs included postulates on motion. The tradition followed the deductive, mathematical order of geometry – although different in style of Archimedes or the Alexandrians. One of the

few names preserved in this tradition is that of Jordanus de Nemore, the author of some mathematical treatises and the *Book on Weights*, which was discussed in different manuscript trends during the following centuries (Moody and Clagett 1952). While this tradition was mostly concerned with the lever, it provided important results in the demonstration of the law of the inclined plane (Roux and Festa 2008). The texts of this tradition were initially published by Peter Apian in Nuremberg in 1533, but a later edition was produced in Italy in 1565 from the manuscripts of Tartaglia – who had already relied on this tradition in his published works (Drake and Drabkin 1969).

Apart from these ancient and medieval traditions dealing with mechanics, some commentary traditions to Aristotle's *Physics* produced elements that were subsequently involved in the Renaissance science of mechanics. In some passages of *Physics*, Aristotle dealt with the motion of projectiles and provided a set of rules to determine the speed and times of things moved in connection with their movers. Aristotle explained the movement of the projectiles in this way: the air was moved backwards by the projected body, in such a way that the same air, at the back of the body, pushed the body forward, thus explaining the continuation of motion. The double function assigned to the air appeared as problematic since the earlier Alexandrian comments by Philoponus (490–570 CE). The most influential alternative came from Jean Buridan (1295–1361), who formulated the theory of *impetus* explaining the motion of the projectiles by a property in the body which was activated when it was pushed by the mover. Aristotle's rules of motion were widely discussed in ancient and medieval traditions; in the fourteenth century, Thomas Bradwardine (c.1300–1349) offered an original variant of them by drawing on the medieval theory of proportion. This approach was also adopted by Nicolas Oresme (1320–1382) who produced a set of works involving mathematical explanations for a wide range of phenomena of motion, including mathematical rules for local motion (Clagett 1959).

Innovation and Original Aspects

The Renaissance science of mechanics emerged to a large extent as an answer to the interests of scholars and practitioners in explaining the spectacular achievements of the mechanical arts during the fifteenth and sixteenth centuries (Valleriani 2009). In different ways, mechanical arts, particularly architecture, had incorporated mathematics, in order to codify their rules for training new practitioners, to improve the efficacy of their results, or even to find a way to expose their projects to their patrons (Bennett 2006). Aristotle's *Mechanical Problems* offered a set of concepts and problems on which humanists, mathematicians, and craftsmen relied to shape their understanding of the science of mechanics. Other texts on mechanics coming from different traditions also circulated during the period, as we have seen; but *Mechanical Problems* was initially influential because it addresses the nature of mechanics as causal knowledge, aligned with the dominant Scholastic views (Laird 2001). The introduction of the text outlined mechanics as a theoretical science and its outcomes, matching in certainty those of other traditional developed mixed sciences (astronomy and optics). The mechanical arts may be the practice of mechanicians, but the knowledge involved in their practice – explaining the construction and operation of machines – is a science. The text claimed that this science derived its way of proceeding from mathematics, but their subject was provided by physics (Aristotle 1936).

In the light of the Aristotelian tradition, the science of mechanics was firstly shaped as a science of machines, concerned with the mathematical principles of design and construction of devices – deeply influenced by the machinery employed in large-scale construction projects. Because of this, the Vitruvian definition of machine, contained in his *De Architectura* (c.30–15 BCE), was a constant resource during the sixteenth century (Rose 1975). However, as the practitioners involved other traditions of mechanics and extended the scope of the mechanical explanations by tackling specific problems

from a variety of other practical fields, the science moved toward a more general explanation of motion. This led to debates on the specific mathematical resources that were seen as valid and the mathematical structure that the science should follow.

The reception of the Aristotelian tradition provided an initial framework for the science of mechanics which evolved as different actors brought in elements from other traditions – sometimes in sharp tension – and according to their backgrounds and interests.

The first translations and commentaries that circulated were those of the humanists and philologists, being the most influential Niccolò Tomeo's (1525). His interests included the articulation of the text with other Aristotelian works and harmonizing the science of mechanics with dominant classifications of knowledge (Rose and Drake 1971). A different perspective emerged from the interpretations and use that mathematicians and engineers made of the Aristotelian text. Niccolò Tartaglia (1499–1557) edited, used, and translated diverse mechanical and mathematical sources, such as those of the “science of weights,” Euclid and Archimedes. However, Tartaglia's background and inspiration came mostly from practical fields, particularly gunnery and artillery (Pisano and Capecchi 2016). His view and practice of mechanics were inspired by Archimedes but extended beyond the concerns with equilibrium and involved the determination of the trajectory of projectiles shot at different angles and the proportion of bodies falling in water according to their specific heaviness. In some cases, he aligned with the medieval tradition of the science of weights against the Aristotelian, arguing that the *Mechanical Problems* relied on physical arguments that may be proved false by the science of weights (Drake and Drabkin 1969).

In contrast with Tartaglia, Guidobaldo del Monte (1545–1607) presented in his *Mechanicorum Liber* (1577) a project of mechanics inspired by Pappus' theory of machines and following the Archimedean focus on equilibrium, rejecting the science of weight as imprecise for involving the consideration of motion and

inelegant mathematics. In his view, all the vicissitudes to which motion was subject made it an inadequate subject for mathematical treatment, and therefore motion should not be considered in mechanics (Drake and Drabkin 1969). The project of the *Mechanicorum Liber* aimed at establishing the foundations of the science of mechanics – the science of equilibrium – on mathematical principles by reducing the properties of all machines to the operation of the lever which could be explained by the properties of the balance. In this way, any machine could be analyzed as arrangements of balances ultimately explained by the same mathematical principles. Guidobaldo's influential book advanced on how the simple machines could be reduced in terms of equilibrium, although his treatment of the wedge hinted at some proportions involving motion (Bertoloni Meli 1992).

Guidobaldo's integration of different traditions in a project portraying an organized mathematical science of mechanics concerned with equilibrium indicates that, by the end of the sixteenth century, the systematization of this science was crystallizing. Disputes about the nature of this project did not extend to the next generation, including figures such as Galileo Galilei (1564–1642), Evangelista Torricelli (1608–1647), or Gilles de Roberval (1602–1675).

These mathematicians and engineers did not direct their efforts toward replacing the principles of the “science of weights” or those of the *Mechanical Problems* in order to find a better foundation for mechanics; their approach was instead to postulate principles in order to solve specific problems, following the practice attributed to Archimedes. In other words, this generation was more interested in extending mechanics than in systematizing its achievements, although both ideals were not mutually exclusive (Palmieri 2008).

Galileo combined elements from ancient and medieval traditions with sixteenth-century developments in function of his background, particularly influenced by his training in practical fields (Valleriani 2010). In tension with Guidobaldo, Galileo mobilized elements of the

science of machines and of hydrostatics in order to tackle problems of local motion – a subject traditionally considered by natural philosophy. In his early works, Galileo considered motion as generated by the difference between the specific gravity of the body and the medium. The image of bodies sinking or floating on the Earth according to their specific gravities allowed him to mobilize resources of mechanics by considering motion as a case of equilibrium (Galilei 1898). This way of considering natural phenomena under restricted conditions and then explaining them by resource to mathematical-mechanical constructions led Galileo to the formulation of the law of free fall or the determination of the parabolic trajectory of projectiles in later works (Shea 1977). Galileo also formulated the science of the resistance of materials which he developed from mechanics: his thoughts on the topic seem to have grown from his engagement with the practical problem of constructing larger galleys, and the foundation of his science is the doctrine of the lever (Valleriani 2010; Bertoloni Meli 2006).

Impact and Legacy

The development of mechanics during the sixteenth century produced sophisticated ways to deal mathematically with physical objects (machines). During the seventeenth century, a growing distrust in the sources of explanation of natural phenomena – Aristotle, Scholastics, and naturalistic philosophies of the Renaissance – led some mathematicians and natural philosophers to find inspiration in the developments of mechanics to formulate alternative natural philosophies and cosmologies. The idea that the universe may be considered a machine goes back at least to the twelfth century. However, at the turn of the seventeenth century, the notion of machine had acquired a new dimension, tied to mathematics, that made it possible to endow the metaphor of the universe machine with new contents. This inspiration in mechanics to formulate new natural philosophies took many different forms during the seventeenth century but became extremely

popular all over Europe, particularly in England, the Dutch Republic, and France. The most influential mechanical philosophy of the early seventeenth century was René Descartes (1596–1650). In his *Principles of Philosophy* (1644), he offered an explanation of the universe in which all change was the outcome of collisions of particles moving according to laws of nature, such as the operation of machines was the result of pieces moving by contact, according to the laws of mechanics.

The mathematical science of mechanics of the Renaissance consolidated into a general science of motion during the seventeenth century. Although disagreements on the nature of the methods persisted, the idea that mechanics was restricted to machines in equilibrium was replaced by the motion of bodies as a general subject. Isaac Newton's *Mathematical Principles of Natural Philosophy* (1687) was presented by his author as the reconstitution of “rational mechanics,” which involved the mathematical explanation of *any* motion as generated by forces. Newton explicitly recognized his work as the continuation of ancient traditions in mechanics, particularly that of Pappus and the Alexandrians. By the eighteenth century, mechanics had grown in mathematical complexity and had reached more areas of natural philosophy (Bertoloni Meli 2006), following a pattern that started in the early sixteenth century with the attempts to explain the wonders of and produced by machines.

Melancholy in Renaissance Medicine

Abstract

In the Renaissance, melancholy was understood as a pathological condition resulting from an excess of black bile, one of the four humors (Babb 1951; Brann 2002; Radden 2002; Schleiner 1991). This view had its roots in the writing of Hippocrates and Galen, but Arabic, as well as Latin Medieval sources, contributed to shaping the concept of a malady that caused, among other symptoms, sullenness, sorrow, obsessive thinking, delusions, and deliria. It was perceived as an epidemic disease, and scientific discussions about its different causes and treatments can be found in many works of medical theory. However, concerns with the topic extended beyond the disciplinary boundaries of medicine and natural philosophy, as melancholy was often discussed in theological context and in connection with spiritual suffering and sin. Renaissance philosophy also developed the association between black bile and geniality, first established by the pseudo-Aristotelian problem XXX.1. Marsilio Ficino plays a signal role in identifying the physiological causes of this association. The most accurate and comprehensive account of Renaissance thinking about melancholy can be found in Robert Burton's *Anatomy of Melancholy* (1621), which also surveys ancient and Medieval sources and remains a point of reference for scholars working on the subject.

Heritage and Rupture with the Tradition

Melancholy, from the ancient Greek μελαγχολία, i.e., “black bile,” is a medical concept which indicates a condition of sadness, fear, and sorrow and which was thought to have significant consequences on the body. The Renaissance understanding of melancholy is not only grounded in humoral medicine and relies mainly on the teachings of Hippocrates (460–370 CE) and Galen (130–210 CE) but was also influenced by the works of Rufus of Ephesus (c. 80–150 CE) as well as by Arabic sources, including Avicenna and Averroes, and Latin medieval treatises on lovesickness (Gowland 2012, 229–30). Medical theory described melancholy as a form of madness caused by an excess of black bile, one of the four humors (the others being yellow bile, blood, and phlegm) which were deemed to constitute the psycho-physiological makeup of the individual and whose imbalance compromised mental and physical well-being. Apart from the emotional disturbances noted above, melancholy yielded many diverse symptoms which included hallucinations – caused by the vapors produced by overheated black bile and which were thought to cloud the mind (Clark 2007, 59) – ravings, and deliria, in which the melancholics believed that they were kings or animals and even that they were made of glass. Physical symptoms included, among others, fever, flatulence, stomachache, palpitations, and singing in the ears. In France, André du Laurens (c. 1560–1609), court physician to King Henry IV, wrote the oft-quoted *Melancholike Diseases* (1599), in which he discussed the different forms and degrees of this condition and regarded melancholic delusions as a product of the deluded’s ill imagination. Melancholy was widely discussed not only by physicians, philosophers, and literary men, but also by theologians (Gowland 2012, 239–241). In the *Treatise of Melancholie* (1586), the English divine and physician Timothie Bright emphasized the interdependence of body and soul as well as the need to distinguish between melancholy as a natural condition and form of spiritual affliction deriving from sin. Following the famous question in the pseudo-Aristotelian Problem: “Why is it

that all those who have become eminent in philosophy or politics or poetry or the arts are clearly melancholics, and some of them to such an extent as to be affected by diseases caused by black bile?” (*Problemata* XXX. 1953a, 10–14), melancholy was traditionally associated with exceptional intellectual powers and shrewd thinking. This connection was richly developed in the fifteenth and sixteenth centuries. In fact, the concept of “melancholic genius” can be seen as an element of originality in the Renaissance understanding of melancholy and Marsilio Ficino (1433–1499)’s view that astral influences acting on the black bile could cause episodes of divine frenzy, and extraordinary accomplishments in different disciplines had a great deal of responsibility in the building of this concept. Ficino discusses melancholy as the physiological cause of genius (Klibansky, Panofsky, and Saxl 1964), and the sixth chapter of Book I of his *Three Books on Life*, first published in 1489, is entitled “How Black Bile Makes People Intelligent.” Here, Ficino argues that black bile makes the *spiritus* – i.e., the vaporous substance which originates in the brain from the heat of the heart and from there flows throughout the body – subtler, hotter, and quicker (Allen 2010, 15–16). “Supported by such compliance,” he says “our mind explores eagerly and perseveres in the investigation longer” (Ficino 1989, 121). The connection between melancholy and geniality influenced philosophers as well as artists and found its most famous representation in Albrecht Dürer’s engraving *Melencolia I* (1514). However, the majority of scholars agree that the most detailed, accurate, and influential Renaissance work on melancholy is Robert Burton (1577–1640)’s *Anatomy of Melancholy*, first published in 1621. Burton defines melancholy as “a habit, a *morbus soticus*, or *chronicus*, a chronic or continue disease, a settled humour” (Burton, 1638, 13; Gowland 2006, 71), and his approach is manifold, including medical theory, psychology, literary rhetoric, philosophy, and theology. Burton was a self-diagnosed melancholic, and the main aim of his study was to “to prescribe means how to prevent and cure so universall a malady, an Epidemicall disease, that so often, so much crucifies the body and

minde.” (Burton 1638, 76). As possible cures to this condition, Burton suggested that the melancholics kept themselves busy, enjoyed the pastoral care of a priest, and the company of friends. In the seventeenth century, there was a gradual shift from humoral theories to physiological causes which involved the body’s and brain’s functions. The English physician Thomas Willis (1621–1675), for example, proposed malfunctions of the spleen and the nervous system as the most likely sources of melancholy (Willis 1685, 311). Nevertheless, despite this shift toward modern etiologies, the seventeenth-century thinking of melancholy remained grounded in humoral medicine.

Abstract

Melanchthon delivered commentaries on almost all contemporary philosophical disciplines with the exception of Aristotle’s metaphysics besides his achievements in theology, church politics, and school reforms. Although he was known as an Aristotelian, he drew heavily on Plato, Neoplatonism, Cicero, and the humanists to advocate a “Christian philosophy.” He was influential through his discussion of the academic disciplines, scientific method, and epistemology. His rediscovery as a philosopher began with Wilhelm Dilthey and

Hans-Georg Gadamer. Within the last three decades, the interest increased in examinations of Melanchthon's writings in the history of science.

Biography

Philipp Schwarzerdt was born on 16 February 1497 in the town of Bretten in the German region of Palatinate. After his father's death, his mother moved to Pforzheim with her children. There, Melanchthon attended Latin school, learning Greek from Georg Simler, who was the first professor of Greek at the University of Leipzig from 1515 onward, and also from Johann Hildebrandt. Reuchlin, Melanchthon's uncle, supported his young relative and awarded him with the humanist name Melanchthon (μέλαν-χρόνος) on 15 March 1509. On 14 October 1509, he enrolled at the University of Heidelberg, graduating 3 years later with a bachelor's in the "artes liberales." During his studies, he read poems by Conrad Celtis, while the theologian and rector Pallas Spangel introduced him to the thinking and the œuvre of Rudolf Agricola. In 1512, after Spangel's death, Melanchthon continued his studies at the University of Tübingen. On 25 January 1514, he graduated as "magister artium." In Tübingen, Melanchthon studied philosophy under Georg Simler and discovered his interest in Aristotle's original writings. Johannes Stöffler introduced him to astronomy and the study of the calendar. Together with Franciscus Stadian, professor of philosophy, and with the participation of Reuchlin, Willibald Pirckheimer, Georg Simler, and others (MBW 17), Melanchthon decided to provide a paraphrase of Aristotle's original text. His first academic accomplishments included the Terenz-edition, a Greek grammar that appeared in May 1518 and received much acclaim, as well as

his speech *De artibus liberalibus* (CR 11, 5–14) which bears importance for his early philosophical understanding. With this, he strived toward a reform of the traditional canon of subjects of the liberal arts, complemented by literature and history.

Relayed through Reuchlin, Melanchthon received a call to the newly established Greek chair at the University of Wittenberg, which he accepted by moving there on 25 August 1518. With that, a diverse academic field opened up to him. At the same time, he came within the sphere of influence of Martin Luther and his theological reformation ideas. This showed not least in certain philosophical critics, for which Melanchthon received renown during his first years in Wittenberg. However, this aspect should not be overestimated. With Melanchthon's annotation on the Epistle to the Colossians in 1527 (MSA 4, 209–303), the critical philosophical motives came to an end causing a great sensation and led to several reprints and a German translation by Johan Agricola. The commentary, in which an elaborate excursion to Col 2, 8 ("See to it that no one takes you captive through hollow and deceptive philosophy [...]") can be found (MSA 4, 230–243), is a plea for philosophy as long as it is separated from (revelation) theology. Especially the declamation *De Philosophia* from 1536 was programmatic for Melanchthon's own philosophical understanding.

Within the years from 1521 to 1536, he worked as a church reformer in the Electorate of Saxony. Melanchthon – ultimately unsuccessfully – took over the role of the leading commissioner at the Diets and theological disputes in Speyer and Marburg (1529), as well as in Augsburg (1530). Moreover, he wrote important evangelical confessions like the first confessional document *Confessio Augustana* from 1530. In all the talks and negotiations, Melanchthon proved to be a much sought-after and nimble negotiating partner in the religious disputes of his time. In 1535 the French king Franz I invited him to mediate the French religious disputes, although this was in vain. King Henry VIII wanted to offer Melanchthon a chair in

England as well. The call to the University of Cambridge that he received some years later in 1553 however got refused. Having written curricula and schoolbooks, Melanchthon's importance for schools and universities cannot be overestimated. So, he was also personally present at the opening of the first Protestant grammar school in 1526 in Nuremberg, which was being led by his close friend Joachim Camararius. But other cities, such as Magdeburg and Eisleben, also sought his advice. Melanchthon was of great influence on the reform of Wittenberg University which had suffered from the consequences of Luther's appearance. From 1522 onward, the number of students and graduations had decreased drastically. As a rector in the winter semester of 1523/1524, he reformed the study guidelines, reduced the traditional disputations, and established obligatory declamations. These exercises were not only meant to encourage formal logical thinking but, more in general, to advance the ability to give a persuasive speech about a specific topic. On special occasions, Melanchthon himself used these declamations to rise to speak. However, significantly more speeches are known from others (Koehn 1985). In 1533 Melanchthon wrote statutes for the theological faculty and in 1545 for the theological and the philosophical faculty and the entire university. Moreover, he participated personally in the reforms of the universities of Tübingen and Heidelberg as well as in the Königsberg, Marburg, and Jena. Through his students, his influence also showed at the universities of Rostock and Greifswald.

Considering all these diverse religious, clerical, scholarly, and university activities, the amount of Melanchthon's writings is remarkable. They most often emanated from his lectures that were – partly by himself – reviewed, edited, and reedited. Although he held the chair for Greek in Wittenberg and in spite of his degree “*baccalaureus biblicus*,” his writings also comprise topics from the higher faculties' theology, medicine, and jurisprudence. They can be found at many European universities and they have had – despite all contemporary polemics – an impact across all confessions. This also holds true for Melanchthon's theological writings. His diverse

annotations to biblical texts are worth mentioning besides his manifold confessional documents that gained confessional character in the *Corpus Doctrinae* from 1560 (MSA 6, 5–377) followed by the so-called *Book of Concord*. Besides the commentary on the Epistle to the Colossians, especially the excursus to Col 2, 8, his two commentaries on the Epistle to the Romans from 1532 to 1540 are crucial for his philosophical perspective (Wengert 1997: 106–148, especially 133–139). There, in line with the tradition of philosophical theology, a discussion can be found about the classical topic of natural notion and a philosophical proof for God's existence (Rom 1, 19 f., CR 15, 564–568; 831–833). This also holds true for his main theological writings in 1521 called *Loci communes rerum theologicarum seu hypotyposes theologicae* and since the second edition in 1535 *Loci theologici* (the third edition initially appeared in 1543). The first main theological writing from 1521 was still biblical hermeneutics, i.e., an instruction to the exegesis of the Holy Scriptures oriented toward the reformatory theology from Erasmus' fundamental concepts. The later main theological writings can rather be depicted as a sum of theologies. There once again, apart from creation theology, it is the philosophical notion of God and the arguments of natural theology that are important for his philosophical perspective (CR 21, 351–370; 607–643). Moreover, the systematic versions of the theory of free will have to be mentioned that Melanchthon had elaborated on an intense debate between Luther and Erasmus (CR 21, 274–282; 373–378; 652–665).

With the exception of metaphysics in the sense of the Aristotelian onto-theology, Melanchthon wrote about all philosophical disciplines of his time. The Greek (1518 and 1520) and Latin (1525) grammar have often been reprinted. His rhetorics, which had their origins in Tübingen, were revised in 1521 until their final version in 1531. It is the corpus of Aristotelian writings that belonged to the most important fields that Melanchthon handed down through his own paraphrases and commentaries. It is crucial for this teaching tradition that Melanchthon took off the burden of the theological problem of a fusion of

theology and philosophy (in the Aristotelian ethics and politics, the goal εὐδαιμονία of the inner world) through dividing between law and Gospels. He did this to secure the autonomy of revelation theology and soteriology. Aristotle's ethics had been revised from 1529 onward, and edited to extended versions until they eventually took shape in the big tractates *Philosophiae Moralis Epitome* from 1538 and *Ethicae Doctrinae Elementa* from 1550. First, Melanchthon's interest in Aristotelian physics led to the short *Commentarius de Anima* in 1540 which was completely revised and published with complements in the *De Anima* from 1553. Moreover, in 1549 the textbook *Initia Doctrinae Physicae* about Aristotelian philosophy of nature was published together with his coauthor Paul Eber. His writings about Cicero's texts and other classical authors are numerous and he was devoted to these all of his life. From 1532, when he began revising the chronicles of the astrologer Johann Carion, he first started giving talks about world history before the *Chronicon Carionis* was published, one of the most important history books of his time, continued by his son-in-law Caspar Peucer after his death. It has to be stressed that Luther never criticized his philosophical efforts. From time to time, however, he accused Melanchthon of "his philosophy" (WA Br 5, 399, 16; 406, 56 ff.; 412, 51 ff.).

With Luther's death in 1546, Melanchthon became more and more mixed up in the internal Protestant teaching disputes, which – besides his university duties – characterized the last period of his life. Struck by the enormous controversies, Melanchthon awaited to be freed from "theologian contentiousness" (*rabies theologorum*) to be able to see the divine secrets (CR 9, 1098). Melanchthon died on 19 April 1560 as a result of a feverish cold that he had caught on a journey from Leipzig.

Melanchthon's Philosophical Concept

In a letter to Veit Dietrich in Nuremberg on 22 June 1537 (MBW.T 1914, 16–18), Melanchthon said about himself to be seen as Peripatetic

(*homo peripateticus*). Undoubtedly, this has led to the Aristotelian interpretation of his philosophy that prevails in research. The didactic lessons in his philosophical œuvre following the Platonic and Ciceronian traditions were considered too. It often happened that this type of philosophy was characterized as eclectic (about this difficulty, cf. Frank 1995, 15–29). The question about how philosophy is to be understood according to Melanchthon can only be answered internally by asking how he himself understood it. In general, three concepts of philosophy can be determined in Melanchthon's writings: (for the following see Frank 2012, 1–10)

Philosophy in the Sense of Erasmus as "Philosophia Christi" or as "Philosophia Christiana"

In Melanchthon's Pauline texts of the early 1920s, we find the Erasmian idea of a "Christian philosophy" (CR 11, 276–278; here: 276), also described as "Pauline" (CR 11, 34), "sacrosanct" (CR 11, 36), or "holy" (CR 1, 22). This notion of the "philosophia christiana" was limited to the first few years of the second decade of the sixteenth century. It was determined by Erasmus' idea of a religious ethics life of all Christians as well as by an aggravation of the theological doctrine of justification in the Pauline theology.

The Philosophical Concept in the Sense of Melanchthonian Humanism

Melanchthon presented his reform program of the classical *artes liberales* in his speech *De Artibus Liberalibus* in Tübingen in 1517 (MSA 3, 17–28) and also in his inaugural lecture *De Corrigendis Adolescentiae* in Wittenberg on 28 August 1518 (MSA 3, 29–42). There, he also clearly formulated his idea of an extensive philosophical canon. Apart from the subject of the trivium (grammar, dialectics, rhetorics) and the quadrivium (arithmetics, geometry, music, astronomy) relating to seven out of nine muses, the canon is complemented by the literary figures Klio and Kalliope. Melanchthon, in line with the tradition from Hesiod onward but especially in line with the Italian humanists, identified these two with historiography and poetry (MSA 3, 26). The canon of

subjects of the *artes liberales* was the same in his inaugural speech at Wittenberg in 1518. Here, too, the subjects of the trivium and the quadrivium that Melanchthon described as either *disciplinae humanae* or philosophy, respectively, were complemented by Greek and Latin literature (Poetry, MSA 3, 38), as well as historiography (MSA 3, 39). Although this philosophical concept was important in Melanchthon's first academic years, since the publications of the 1530s, it has become clear that his concept of philosophy did not only comprise an extension of subjects of the artistic faculty by adding poetry and history. His idea was to reach the higher faculties of medicine and jurisprudence as well. As long as philosophical theories were discussed in theology, such as a philosophical concept of God, a philosophical proof of God's existence, and the Aristotelian doctrine about the world's eternity and free will, such a concept of philosophy would also stretch out to theology.

The Universal Scientific Concept of Philosophy

In the substantial philosophical writings of this œuvre, philosophy can be understood as a universal scientific concept. It goes beyond the canon of subjects of the *artes liberales* and characterizes Melanchthon's rather productive œuvre since the 1530s. He had programmatically formulated such a universal scientific program in his speech *De Philosophia* from 1536 and thus had laid its foundation (CR 11, 278–284). Here, philosophy does not only comprise knowledge of the grammar (i.e., the trivium of the *artes liberales*) but also that of the science (*scientia*) of philosophy and a lot of other arts. Philosophy of nature and moral philosophy are as important to this comprehensive science of philosophy as a scientific methodology (dialectics) and rhetorics (CR 11, 280) with a whole field of sciences being interconnected and referring to each other. Apart from the humanist subjects of the *artes liberales*, psychology, moral philosophy, and philosophy of law are also significant. Aristotle's metaphysics, however, is excluded from this universal scientific concept of philosophy. Even if a multitude of philosophical lessons (the concept of God, the immortality of

the soul, etc.) must be treated in theological discourse, according to Melanchthon, he nevertheless drew a clear line between philosophy and theology as long as he motivates theology with biblical revelation, i.e., theology being either a scriptural interpretation or essentially argumentatively based on the Holy Scriptures. The strict division of theology and philosophy is expressed in the lexical differentiation of Gospel and law.

Philosophy of Mind and Epistemology

The Neoplatonic philosophy of the mind is the center of the universal scientific understanding of philosophy developed in Melanchthon's *Liber de Anima*. Moreover, it is also fundamental to ethics and politics (for more information, see Frank 1995, 86–95). This becomes clear from Melanchthon's description of the soul. Contrary to Aristotle's ἐντελέχεια, he depicts it in line with Cicero's diction following Plato as ἐνδελείχεια (CR 13, 12–14, cf. Salatowsky 2006, 91–103). Firstly, this definition exposes the Aristotelian hylomorphism in which the soul is related to the physical body. Secondly, it lays the foundation for the independent and immortal soul (more about the philosophical line of reasoning of the immortality of the soul can be found in Frank 1993 [*195]). In the context of the theological doctrine of God's own likeness, the relation between the divine mind and the human mind is interpreted as Platonic exemplarism. That means that the human being participates with his mind and especially with the epistemological principles (*notitiae naturales*) that are inherent to it in the divine mind (CR 13, 5; 11, 941) and also in his reign over the world (CR 11, 942). Melanchthon's classification of the properties of the soul only superficially follows an Aristotelian-Thomasian position. In addition to the three levels of the soul, the vegetative, sensitive, and rational powers, the soul possesses five properties: *potentia vegetativa*, *sentiens*, *apetitiva*, *loco motiva*, and *rationalis*. It is the *potentia rationalis*, the soul's highest property, that Melanchthon explicitly identifies with the human mind (*mens*). What is

specific about this idea of the mind is the connection between the traditional philosophical term of the soul and the epistemological principles (*notitiae naturales*, cf. the chapter *De potentia rationali seu Mente*, CR 13, 137–142). Melanchthon's theory of these epistemological principles given to the human mind through creation has its terminological origin in Epicure's experiential epistemology (πρόληψις) and in Stoicism (κοινὰ ἐννοίαι). These epistemological theories are connected with both the notion of a preconception and the mutual terms implicating an experiential realism. Cicero and Boethius had already interpreted them in an a priori new-platonic way (Horsley 1978; Frank 2008). They can also be found in Melanchthon's review of certain passages in the text of the Ciceronian topics with a commentary by Boethius (CR 16, 820 f.). Melanchthon attributes a polyvalent function to the theory of the *notitiae naturales* that is crucial for his philosophizing. First of all, this theory is about elements from the philosophy of the mind. The epistemological principles are the concrete place at which the human mind participates with the divine mind; they are "rays of divine wisdom" (CR 13, 138) in the human mind. Moreover, these epistemological principles form the *cognitive psychological noetic aspect of epistemology*. In the disputes about the origin of all understanding between Plato and Aristotle, to which Melanchthon refers here (CR 13, 143 f.), he chooses the Platonic epistemological apriorism. Since these principles are the a priori basis of all understanding, "all sciences originate in the understanding of the soul" (CR 13, 167). Consequently, Melanchthon reflects the Aristotelian epistemological realism in his premise, "nothing is in the intellect that is not in the mind before." The *notitiae naturales* exist independently from perception and are thus a prerequisite of all understanding (CR 13, 144). At the same time, they are criteria of certainty of knowledge and thus form the *epistemological aspect of his theory of science*. This is not only about geometrical principles like "The whole is greater than any of its parts," but it is also about principles of formal rationality prerequisites like "Something is or is not." As such, the criteria of certainty do not only provide

the basis for anthropology (CR 13, 149–153), philosophy of nature (CR 13, 185–190), and moral philosophy (MSA 3, 158 f.). They are equally important for theology that finds another criterion of certainty in the divine revelation that a human being had to acknowledge even if revelation differed from judgment by reason (CR 13, 650). This is the fourth *gnoseological aspect* of the theory of the *notitiae naturales*. These principles will find proof only in relation to the theory of the *lumen naturale*, the natural light of the human mind through knowledge. The epistemological principles are inherent and evident because of this light and are in fact in accordance with the divine mind (CR 13, 648 f.).

Dialectics, Rhetorics, Epistemology, and Scientific Theory

Dialectics as Fundamental Science and Rhetoric

For Melanchthon, dialectics is connected with the claim of fundamental science. This is in line with Petrus Hispanus and against Rudolph Agricola's program. "Dialectic is the science of all sciences (ars artium, scientia scientiarum) [...], since here the path to the principles to all methods can be found" (CR 13, 515). The fundamental scientific claim has two perspectives: on the one hand, it refers to dealing with all topics and questions about which human beings must be apprised and on the other hand, dialectics offers a general method for the examination of all objects (CR 13, 514 f.). As in other humanist dialectics, here too, it is the dialogue (colloquium), the argumentation where dialectics takes place so that Melanchthon's translation of διαλέγομαι consequently is "unterredkunst" (the art of speaking) or "unterrichtkunst" (the art of teaching). This pragmatic argumentative interpretation of dialectics makes clear that it naturally forms the other part of rhetorics. While "Dialectics is concerned with all matter and depicts the highest of all things without any embellishment," "Rhetorics adorns substance with the jewellery of oration" (CR 13, 515). This classic positional description is just one superficial aspect between rhetorics and

dialectics. At the same time, Melanchthon considers rhetorics as a method that ensures comprehension (of texts from classical authors, the Holy Scriptures) and moves rhetorics more into the direction of hermeneutics (Knappe 1999). Dialectics can then be integrated into rhetorics as a method for textbooks wherever specific factual questions in the former are raised and one cannot do without the latter. In addition to the classical genres of the *genus demonstrativum*, *deliberativum*, and *iudicale*, Melanchthon introduces in his rhetorical system the *genus didascalikón* (*didacticum*) as the most important innovation. Its goal is the transfer of knowledge, i.e., how the knowledge that is inherent in a text can reach the listener. J. Knappe appropriately defined this rhetorical concept as a text-theoretical double perspective combining traditional rhetorics (aiming at production) with Melanchthon's rhetorics (aiming at reception). This is according to the humanist goal according to which texts do not consist of dead language or mere theory but are rather understood as something that has to be reanimated.

The Two Parts of the Dialectics: Iudicative Analysis and Topical Invention (*Loci Communes*)

In the first version of the *dialectics* dated 1520, Melanchthon still mainly follows the methodological concept of Agricola's art of finding, the *inventio* and the *iudicium* (CR 20, 749). In the main dialectical text of 1547, the methodological steps are reversed. Here, the iudicative analysis is applied first before invention, which can be ascribed to topics, takes place. Iudicative analysis serves the evaluation of terms in syllogisms or other argumentative figures, while invention belongs to the finding of things and is thus subject to the doctrine of the *loci* (CR 13, 641). The reversion of the methodological steps in the dialectic procedures emphasizes its redefinition. According to Agricola, topical invention is no longer an art of finding as such, but an evaluation and explication of all things, it is subordinated to *iudicium*, the first step in the justification of knowledge. Melanchthon's dialectics as a general theory of science can be seen as topically

extended analytics, with as formal evidence as demonstrative, dialectic, and sophistic syllogism, as well as the enthymeme as developed in Aristotle's *Prior Analytics*.

While the first part of the dialectic forms the analytical procedure with which an evaluation of terms and propositions in syllogisms and other argumentative forms is possible, the second part of the *loci* doctrine offers an index of all things that can be discovered and selected. Here too, Melanchthon's statement (cf. CR 20, 698) holds that these *loci* are not found arbitrarily but made up of places closest to nature ("ex intimis naturae sedibus"). Melanchthon's understanding of *loci* shows three different meanings (cf. Mertner 1956; Wiedenhofer 1976, Vol. 1, 373–376): Primarily, *loci* are seen as *sedes argumentorum*, i.e., the place where arguments are found. Secondly, the notion *loci* is used as general understanding of general thoughts. Thirdly, being especially interesting, they bear a content-related significance since they refer to the relevant fundamental concepts of all sciences. Especially on this level of meaning, it becomes clear that *loci* are not merely arbitrary terms and citations as Melanchthon stresses in this rhetorics in 1531 (CR 13, 451–454). They are, in a modern way of speaking, semantic substrates obtained from the abstraction of a text (such as the Bible or history). As an example of this extraction from a narrative text, Melanchthon mentions Cicero's *Oratio pro Milone* (CR 13, 451). There, Cicero narrates that God has punished Clodius for his crimes against religion. From that, it may be concluded that God exists and reigns over the world. "It is thus about a semantic-analytical procedure where propositions are extracted from texts and consolidated categorically" (translation of Knappe 1999, 130). As such, *loci communes* are prominent elements (*praecipua capita*) of all sciences.

The Importance of the Criteria of Certainty for the Philosophy of Science

The formal evidence of syllogism is found in the criteria of certainty of all knowledge. Melanchthon regularly taught three criteria of understanding certainty: general experience, the epistemological principles (*notitiae naturales*), and the realization

of a syllogism consistency (more detailed in the *Dialectics*, CR 13, 647 f.). However, Melanchthon does not account for the systematic difficulty arising through such a theory of principles of certainty of knowledge, i.e., of how to mediate between the prerequisite of knowledge that is related to experience and aprioristic as laid out in the epistemological principles of the *notitiae naturales*. Melanchthon's own solution, developed thoroughly in the doctrine of intellect of his psychology, however, is clear. In opposition to the position of the epistemological realism that he discusses with respect to the Aristotelian dictum "Nothing is in the intellect that is not given in the sensory experience before," he stresses that the epistemological principles as aprioristic prerequisites of all understanding are rather not to be found in sensory experience. Both philosophy of the mind and an epistemological theory corresponding to this theory, make clear that all knowledge is a conceptualization from the perspective of the human mind in consequence of the a priori given epistemological principles (*notitiae naturales*).

Geometrical Mathematical Ideal of Methods: Synthesis and Analysis

To Melanchthon, the method is a *habitus*, i.e., the science or the art of finding a way of presenting things in an ordered way. Its formal evidence is a twofold syllogism: the understanding that is drawn on the basis of known principles or general experience in an ordered process of drawing conclusions or, as Melanchthon briefly notes, the method that develops from a reversed process, i.e., it is reducible to the principles from the consequences (CR 13, 652). Melanchthon himself calls these two methodological procedures *compositio* or synthesis referring to geometry and *resolutio* or analysis, respectively. His methodological claim follows exactly that of the ideal geometrical methods: Firstly, the method of synthesis, the procedure that brings proofs from the principles to the conclusions. Secondly, he also uses the method of analysis as the deduction from the conclusions to the principles, where these principles (of geometry, philosophy of nature, and moral philosophy) claim to be free of reason and evidence and to be independent of a specific

revelation (CR 13, 654). This explains why Melanchthon chose Aristotle from all the available authorities. He empathically calls him the "one and only builder of method" (CR 11, 348 f.).

Melanchthon's ideal geometrical method must be seen in the historical context of Proclus' edition of the commentary on Euclid. In 1533, Melanchthon's friend Simon Grynaeus published it in Basel (CR 2, 815). Melanchthon was fulsome in his praise of his friend because of this œuvre and other editions. Such a methodology free of metaphysics, as applied in Euclid's *Elementa*, immediately suggested itself, especially since Melanchthon's writings reflect a rejection of Aristotle's onto-theology. Here, Melanchthon realized that the origins of all sciences lie in the ideal methodology of geometry (CR 11, 291). He explicated this realization in his *Praefatio in Geometriam* from August 1536 (CR 3, 107–114). In line with this ideal, knowledge in sciences is motivated on the basis of primary and evident sentences that are free of reasoning. The procedure of gaining evidence from geometry is generally considered a model for a scientific procedure of taking evidence (CR 3, 108). In the sixteenth century, it was right this reception of these classical mathematical methodological models that had had a deep impact on the discussions about the methods until the Enlightenment as Engfer's study of 1982 (esp. 72–88) shows.

Practical Philosophy and Law of Nature

Despite all critical remarks that Luther expressed about the Aristotelian ethics, it was Melanchthon who effectively established his ethics and politics in Protestantism with the central concepts of reformatory theology. In line with his topic procedures, which are characteristic of scientific disciplines, Melanchthon's writings about Aristotelian ethics and politics are paraphrases of selected lessons. He illustrates these with the classical scientific consensus and explicates them in the context of contemporary practical questions. This is reflected in the fact that he never revisited all texts about ethics and theology. His paraphrases are determined by *topoi* or central concepts of

reformatory theology. By means of the inherent dialectic between law and Gospel and under consideration of the theological concepts of *finis hominis*, *virtus*, and *iustitia*, he discusses fundamental ethical and political questions. It is theology that shapes ethics and politics and especially Luther's dialectic of law and Gospel that Melanchthon applied to all scientific disciplines. To Melanchthon, the structural principle, developed out of this dialectic, which refers to whatever a human being ethically or politically wants to or can do is without any soteriological importance.

The central theological perspective of practical philosophy also illustrates the determination of the purpose of human life, i.e., the question of the Aristotelian εὐδαιμονία. In the chapter "Quis est finis hominis?" of his *Moral Philosophy* of 1538, Melanchthon differentiates between the *finis principalis*, the goal found in the knowledge of God and the obedience to Him, and the *finis minus principales* being the subordinated goals that can be achieved through acts of virtue (CR 16, 30 f.). In order to understand the *finis minus principales* with respect to the human acts of virtue, it is important to know that Melanchthon – in a supposed Aristotelian manner – relates them to the law of nature (cf. chapter "Quae est ratio sententiae Aristotelicae?" CR 16, 31). Similarities to the law of nature can indeed be found here. Central in his ethos, however, is the way of habituation. Although – as Melanchthon admits – ethical reasoning in Aristotle is obtained from the principles of the philosophy of nature, the argumentation has to follow these true and solid principles of the philosophy of nature that are constituted in the divine mandate: the law of God. This is nothing else than laws of nature (*leges naturae*) than divine laws (*leges divinae*), and thus the practical principles established by God's order in nature (CR 16, 31). Therefore, natural law theory has a prominent role in the establishment of practical philosophy. Melanchthon's attempt is thus one out of several in the sixteenth century trying to newly establish a law of nature. As Scattola's study on Melanchthon has shown, what all these efforts have in common is that they explicate the "law of nature as doctrine

of natural law and its integration in a general understanding of a cosmic order." Moreover, the law of nature is understood as an *objective norm* and "valid for all human beings to which it is innate, obtaining its validity from God's will" (translation from Scattola 1999, 37). The law of nature is justified – and thus the concept of a law of nature cannot be secularized – by the *lex dei* and the *lex divina* or as their manifestations the *leges divinae*, respectively, as passed on in the books of Moses and in the Gospel. Melanchthon calls these *leges divinae leges mosaicae* and divides them into three groups: the *leges morales*, unfolding most clearly in the decalogue; the *leges iudicales* or *forenses*, referring to positive laws such as marriage, claims of ownership, and punishment; and the *leges ceremoniales*, meaning cultural and ritual rules (Melanchthon's natural law theory is elaborated in the two *loci theologici* in 1535 [CR 21, 388–406] and 1543 [CR 21, 685–719]). Melanchthon's schoolbook on books I–III of Aristotelian politics shows the same topic procedure that also characterized his writings on ethics. It deals with paraphrases of particular lessons that he discusses under the guideline of theology and with respect to contemporary political events. Here it is Wycliff's rise, the Anabaptists, and several theologians from Switzerland and Strasbourg that are worth mentioning. Melanchthon accuses them of not differentiating clearly between state and Gospel (CR 16, 419). Fundamental to his understanding of the state is its basis in the law of nature. Thus, as Melanchthon stresses, "the *Politica* deals with the civil society and the duties stretched out over society whereby the reasons for society are derived from nature" (CR 16, 421 f.). Like all scientific disciplines, politics, too, originates in the primary, most general principles inherent in nature. Primary political principles are the following: the human being is naturally made to live in a community, with the first community as the lawful association between man and woman (CR 16, 423). From these principles, others could be obtained. Melanchthon – in line with the justification of the state according to the law of nature – identifies these general principles of politics with the law of nature that he equates with the divine law (*ius divinum*). It is

remarkable that Melanchthon reveals the traditional determination of the human aim as εὐδαιμονία in general and that of politics as *utilitas*. “Since the state is,” as Melanchthon defines it, “a lawfully built community of citizens with the goal of having mutual benefits, most essentially with the aim to defend” (CR 16, 435). With this, he unambiguously avoids the theological problem of how to bring in harmony the εὐδαιμονία as the state’s aim, as understood by Aristotle, with the goal of revelation theory that the human being cannot achieve himself but that it is given to him through belief.

Philosophy of Nature, Theology of Nature, and Natural Theology

Melanchthon’s *Initia Doctrinae Physicae* (1549) consists of paraphrases about the natural philosophy that are explicated by means of the central concepts (*loci*) loaned from the topics. Moreover, central concepts from anthropology (the doctrine of intellect) and ethics (*de fine hominis*) also have to be included in the *loci* (CR 13, 195–197). However, the philosophy of nature is separated from revelation theology along the lines of the law-Gospel dialectic. Although natural philosophy opens with the lesson of philosophical knowledge of God and philosophical proofs of the existence of God, Melanchthon stresses that natural philosophical knowledge of God means knowledge of the law and not of the Gospels (*esse Legis notitiam, non Evangelii*), and that these – being the dialectic’s scope – are without any importance for soteriology (CR 13, 198). Melanchthon himself claims his natural philosophy to be Aristotelian (CR 13, 183 f.), an evaluation that has only a limited scope of application. It is tightly connected with what recent research has shown (Kusukawa 1995; Frank 1998; Bellucci 1998; Groh 2003): natural philosophy has to be looked at in the light of the transformation process from late scholasticism toward early modern natural philosophy. Melanchthon specifically reformulates the central philosophical categories of the Aristotelian philosophy of nature against the background of classical and medieval

discussions. According to Aristotle, the notion of motion comprises a distinction between accidental motion and substantial motion where the latter does originate in itself while the former does not. Melanchthon reduces the notion to accidental motion that he identifies with “entelechy,” the Aristotelian term modified by Cicero, and that he understands as the principle of motion as such (for Melanchthon’s discussion about the notion of motion, see CR 13, 354–361). This reformulation of the motion term aims at visualizing the world as a continuous causal nexus that can be seen as qualities in the motion itself. Besides, the transcendental principle of motion does not follow the Aristotelian interpretation of the “prime mover” but the platonic meaning as being created by an architectural mind (*mens architectatrix*, CR 13, 373). The different versions of the proof of God’s existence of the “causa prima efficiens” show that the causal concept is also formulated theologically and identified with the concept of God as such. Finally, his discussion of the final causation as the immanent teleology of nature shows that he eliminates this causation as an ontological fundamental category (CR 13, 307 f.) relocating it in the transcendent, goal-setting mind. The organizing mind thinks the “fines,” toward with things strive naturally then (CR 13, 346 f.). That means that only a God-given inclination (*inclinatio*) into the body remains from the entelechian structure of nature (CR 13, 349). Therefore, the teleology of nature eventually does not eventuate in its entelechian structure but in a transcendental, goal-setting mind or, in short: the teleology of nature becomes the theology of nature. All in all, Melanchthon’s view of nature boils down to a metaphysical optimistic view of the world, exhibiting three aspects: (1) the idea of a continuous causal nexus of nature, with the human mind as its counterpart that can make true statements about nature, (2) the idea of a world machine (*machina mundi, universa machina*, CR 13, 206; 294) as the achievement of ordering and intelligent reason, and (3) the idea that results in theological anthropocentrism insofar as the whole nature is made for the human benefit (CR 13, 204 f.; 213 f.). Although Melanchthon differentiates between law and Gospel and

thus clearly delineates the philosophy of nature from revelation theology and soteriology, a certain tension is built up between creation theology and the theology of salvation since, according to Melanchthon, outside of revelation, nature too is a book or mirror in which God manifests Himself (CR 13, 198).

That Melanchthon's philosophy of nature is ultimately a theology of nature, prefiguring the early modern tradition of the *theologia naturalis* also becomes clear since the independent treatise *de deo* precedes it. There, the specific implications of the philosophy of the mind in his own philosophy also gain importance for a theory of God within the philosophy of nature. There, too, it is the Platonic concept of God that Melanchthon borrowed from Plato's *Timaios* and that he explicitly prefers over the Aristotelian foundation of philosophy of nature (CR 13, 195): "God is an eternal mind, the cause of all good things in nature," (CR 13, 199). As with the Pythagorean *Timaios* who described the world's composition in terms of mathematical numbers, in line with Plato, Melanchthon talks about God as a geometrician who exhibits the divine architect's wisdom (CR 12, 246 f.). These numeral metaphysical considerations, which in the following are also reflected in the respective proof of God, unmistakably correspond to the importance of the geometric mathematical method as a model for a general methodology as postulated for all sciences by Melanchthon.

The philosophical concept of God, however, does not result from the knowledge of being based on ontology, but it is an epistemological principle (*notitia*) inherent to the human being. It is not just proof of God's existence as the world's designer but also the attributes of his being: wisdom, benevolence, justice, and others (more detailed in CR 13, 198). Melanchthon teaches nine proofs of God's existence that can be divided only superficially into cosmology and anthropology (CR 13, 200–202; commentary to the Epistle to the Romans dated 1540: CR 15, 564–568, cf. Frank 1995, 227–333). Eventually, all proofs of God's existence result from the intellect's activity on the basis of inherent epistemological principles

(*notitiae naturales*, πρόληψις): causality, motion, and finality; the "ordo naturae" and the numbers, providence, astronomy, and astrology; the human mind; the ability to distinguish between good and bad; and conscience.

Influence on Modern Thought

When regarding the size and the distribution of Melanchthon's philosophical oeuvre of the sixteenth and seventeenth centuries in Europe, the fact that his philosophy has mostly been disregarded in philosophical historiography calls for an explanation. The reason for the neglect that basically still holds true today lies in the duographical perspective "Luther and Melanchthon." Although already present in Melanchthon's theology, it was especially fatal for his philosophy. This perspective was formulated as early as the eighteenth century when Melanchthon received renown as Protestant Aristotelian in the big philosophically historiographical oeuvres. In 1743 the law professor Johann Gottlieb Heineccius from Halle claimed with regard to Melanchthon's philosophical ambitions: "Lutherus surely did notice this and used to say: I push scholastic philosophy out of the front door and Philippum lets it in through the back door again" (the difficulty is elaborated in Schneider 2003 [MSB, Vol. 7, 11–131; here: 112]). It is unclear when this perspective in its consequence came up for Melanchthon's philosophy. According to Sparr (1976, 206) it is a product of the "pietistic conception of history." However, it is already historically present in the well-known Hoffmann's dispute from 1593 to 1600 at Helmstedt University (Frank 2003, 79 f.). Daniel Hoffmann and his scholar Caspar Pfaffrad, drawing on Luther's doctrine of the double truth and with respect to Melanchthon's philosophical theology, let themselves get carried away in this controversy. It culminated in Hoffmann's work *Pro Duplici Veritate Lutheri* in which they claimed that "philosophers" were the "fathers of all heresies." It is at least there where Melanchthon's philosophy starts being discussed in relation to the "legitimate matter" of reformation.

In the nineteenth century, Melanchthon almost entirely became the subject of the history of dogma and of ecclesiastical history. Even if he was discussed in relation to the criticism of scholastic philosophy that he himself supported, this criticism – according to Hegel – refers “more to the literary, to the history of education, of religion than to the history of philosophy” (translation of Schneider 2003 [MSB Vol. 7, 112, *An Melanchthon* 2]). To Schelling, too, according to whom “Reformation which left open the discussion about the speculative dogmas as passed on by church [...]” that has shifted “preferably to the side of the inner process” (translation of Schelling’s *System der Weltzeitalter XIV*, 333; cf. MSB Vol. 7, 133–145), Melanchthon’s philosophical sources of knowledge at most are evidence for a “natural, also just as little free knowledge”. With Dilthey’s attempts to found a methodological basis for humanities, Melanchthon received attention again for the development of a natural system of humanities in the sixteenth and seventeenth centuries (1892/1893).

Although in the twentieth century some monographic studies about Melanchthon’s philosophical understanding exist (Petersen 1921; Wundt 1939; Ratschow 1964–1966), they did not have a great impact on research of the history of philosophy. Even the intensified research from the second half of the twentieth century about the philosophy of humanism and renaissance – for example in the *Institut für Geistesgeschichte und Philosophie* in Munich – Melanchthon’s philosophy is treated more as a side issue. It was not until the last three decades that his philosophy again received more attention in research.

Natural Theology

Research on Melanchthon’s importance for the formation of natural theology in the early modern age resulted from a controversial theological difficulty of the twentieth century. It was Karl Barth, an influential theologian, who made the claim “of the church-dividing character of natural theology”

(Kraus 1987, here: 19). According to him, natural theology was church specific and thus non-Protestant as the dogmatization of a natural, i.e., philosophical knowledge of God at Vatican I in 1870 showed (DS 3004). Contrary to Barth’s prominent thesis, K. Feiereis’ studies pointed the way by revealing that until the Enlightenment the early modern tradition of natural theology, neo-logy, and theology of physics referred to the late medieval predecessors Raimund of Sabunde (*Theologia naturalis sive liber creaturarum*, 1496) and the Jesuit Benedictus Pererius (*Physicorum sive de principiis rerum naturalium*, 1562), being an influential tradition in the late reformatory Protestant and reformed theology. Only through I. Kant’s critic this tradition was overcome before being transformed eventually into philosophy of religion. It was Melanchthon then who was fundamental to the natural theological tradition in Protestantism (Frank 1995). With his distinction between law and Gospel, he provided the opportunity of a, though beneath the level of revealed theology, theologically insufficient but philosophically legitimate *theologia naturalis*. With the late differentiation of the *notitia dei naturalis* as *innata* or *aquisita*, respectively, as prevalent in Protestant orthodoxy, his theory made it possible to integrate the natural knowledge of God as a philosophical element both into Lutheran and reformed dogmatics (Ratschow 1964–1966). Melanchthon still strictly separated the theory of the *theologia naturalis* from the theology of revelation. However, this theory paved the way for deism and the eighteenth-century idea of a religion of reason. It ultimately resulted from a systematic difficulty that Melanchthon himself did not solve. Since philosophy cannot function as a rational understanding of religious truths (such as Trinity or soteriology) – being the essence of the criticism on medieval metaphysics as well as the result of the Protestant scriptural principle – philosophy and theology complement each other (more detailed in Frank 2003, 79–87). Its concrete philosophical explication was due to the emphasis that the theology of revelation was given in each case. Therefore, Melanchthon’s philosophical theology, to the exclusion of the theology of revelation,

could become the basis of a natural concept of religion in Anglican deism.

Innatism

In this context the epistemological status of the epistemological principles, as Melanchthon adopted it in the Platonizing, a priori manner of Cicero and Boethius (*notitiae naturales*, κοινὰ ἐννοίαι, πρόληψις), plays an important role for the foundation of philosophy. In Melanchthon, these general epistemological principles are seen as natural, inherent to the human mind, and an a priori condition of all knowledge. In research, such a position is denoted unflatteringly as “innatism.” The theory of the “*notitiae naturales*” figured prominently in the second half of the seventeenth century in the discussions about the metaphysics of ideas (Nicolas Malebranche: *Recherche de la vérité*, Paris 1674–75; Antoine Arnauld: *Des vrayes et des fausses idées*, Cologne 1683). Under the term “common notions,” they also played a role in Herbert Cherbury’s philosophy of religion as well as in the philosophical foundation of the so-called Cambridge Platonists (Frank 2003, 221–260). They were also used by Descartes as such axioms or eternal truths being immediately certain from the intuition of the “*lumen natural*” (*Principia philosophica* I, 49 f.). In the meantime, attempts were found to transform the natural and thus naive uncritical innatism into a dispositional one. In the metaphysics of ideas, the English Platonist Ralph Cudworth did precisely this in his main writing *The True Intellectual System of the Universe* (London 1678) where he tried to explicate ideas as human consciousness on the basis of a priori given abilities against the background of his Platonism (Frank 2003, esp. 281–292). John Locke’s main epistemological text *Essay Concerning Human Understanding* (London 1689) meant a radical criticism of this tradition. In his criticism of innatism, he developed an empiristic doctrine of forms so that all a priori epistemological theories became obsolete. In response to Locke’s empiristic doctrine of forms, Leibniz’s continuous commentaries, published in 1765 as *Nouveaux essais sur*

l’entendement humain, tried to renew the metaphysics of ideas with his theory claiming that ideas were structural factors of consciousness itself. Due to the so-called critical turn in Kant’s philosophy in 1769, philosophical interest had changed fundamentally in this later publication.

Rhetorical Topics/Loci Communes and the History of Science

A specific program of the understanding of science is connected with Melanchthon’s “loci” theory. Especially the third meaning of the “loci communes,” which exceeds the interpretation as “*sedes argumentorum*” as already present in Agricola, means a radical change of the notion of “loci.” According to this, “loci communes” do not denote the notion found through invention but are content-related and subject-related guiding concepts of every science (“in omni doctrinae genere praecipua capita”), this being the reason why the *iudicium* is to be preferred over the *inventio*. Interestingly, they are treated in the rhetorics and not in the dialectics (CR 13, 451–454, cf. also the separate writing *De locis communibus*, CR 20, 695–698). Moreover, since they are subject-related conditions they are also discipline-related. Thus, as Melanchthon stresses, different guiding concepts and fundamental concepts hold true for theology compared to philosophy (CR 13, 453 f.). Therefore, the “loci communes” lose the formal traces of their roots in the topics (more detailed in Schmidt-Biggemann 1983, 19 f.). However, since in rhetorics they are treated as epistemological, subject-related formal central concepts constituting single sciences, they receive a primary, categorical status again. In the early modern age, such a model of equal sciences, based on subject-related central concepts according to each discipline, had had a great impact. Before Melanchthon’s death, Johannes Nysaeus (†1599), a scholar from the German region of Baden, published his *Tabulae Locorum Communium Theologicorum Philippi Melanchthonis* in 1560 that Melanchthon himself had authorized through having written the text’s prologue. In this work, Melanchthon’s whole

theology is depicted in tables of “definitions” and “distributions” according to the loci method.

For some time now, the scientific historical status of this understanding of science, oriented at the rhetorical topics, has been brought up in early modern research. The comprehensive study *Europäische Literatur und lateinisches Mittelalter* by E. R. Curtius in 1948 tended toward the claim of understanding occidental culture as a process in which topics itself is part of the history of science. That means that the rhetoric topical knowledge management is to be understood as the central criterion of scientificity. The alteration of knowledge from the Middle Ages to the early modern age can be described with the aid of this (Frank et al. 2007). Against the background of an Aristotelian conception of science that is not about the collection of “topoi” of knowledge but more about a general analytical conceptualization, this process of making science rhetorical is not undisputed. This is shown in the thesis of the humanists’ “loci communes” tractates: the possibilities of statements in the single disciplines depend on specific “topoi” and they firstly constitute them as such. Besides this topical tradition of understanding science, Aristotelianism remained the predominant scientific concept at the European universities of the early modern age.

Hermeneutics

Recent research is increasingly interested in Melanchthon’s importance for the development of (early modern) hermeneutics. W. Dilthey (1900) and H. G. Gadamer (1976, esp. 148 f.) considered sixteenth-century Protestant theology to be the origin of hermeneutics as the art or science of text interpretation. Subsequent to Dilthey the hermeneutic problem is interpreted as a consequence of a realignment of theological dogma originating in the so-called Protestant scriptural principle or the “sola scriptura” principle. It resulted from Luther’s insight that the Holy Scriptures were “their own interpreter” (*sui ipsius interpres*). In his essay *Rhetorik und Hermeneutik*, Gadamer, in connection with this not undisputed assumption that the early history of hermeneutics eventually resulted

from the theological controversies about the scriptural principle in the sixteenth century, had renewed Dilthey’s approach. He interpreted the “history of hermeneutic theory [...] as resistance of the anti-reformationist, Tridentine attack on Lutheranism” (translation of Gadamer 1976, 149). Although recent research on hermeneutics extensively made corrections and more precise statements of the paradigm, it becomes obvious that Melanchthon’s theory of rhetorics has a special status. As pointed out by Gadamer, this concerns especially the most important realignment of his rhetoric theory: the introduction of the “genus didaskalicum” as a lecture (newer studies can be found in Knappe 1999).

In his so-called chapter on hermeneutics in the *Tübinger Rhetorik* (1519), Melanchthon already developed an extensive theory of the understanding of texts in the chapter On Interpreting Genus (De Enerratorio Genere). As its dual procedure, he had proposed the explication of the text’s content as well as that of the genre’s specifics (for more detail, see Knappe 1999, esp. 125–129). While the first technique is about the paraphrasing of the text’s contents, the second one is described as “method of commenting” (*de commentandi ratione*). Melanchthon assigns four types of texts to this procedure: expository for didactic explaining, narrative-historical for narrating, rhetoric-argumentative for persuading, and poetical encoding for allegorizing. In line with J. Knappe (1999, 129), the analysis of the four text types and of the respective procedures of interpretation can correctly be described as Melanchthon’s procedure of a hermeneutical topic. According to this, the comprehension of texts depends on the analysis of the respective purpose of the speech (CR 13, 423: *intentio, scopus orationis*) as well as on the context of the respective text (CR 13, 468: *quaerendae circumstantiae*). Undoubtedly, Melanchthon later used this hermeneutic topic procedure for the interpretation of biblical and theological texts, as well as for his homiletics. Historiographically it is important that he applied this procedure, which he developed during his time in Tübingen, to his first Protestant dogmatic *loci communes* in 1521. In a letter to his friend Johannes Heß (MBW.T

84, 70–74) on 27 April 1520, Melanchthon admits to having borrowed from the rhetorics while working on this systematic theology. For the early history of hermeneutics, this note and the fact that the so-called Tübinger rhetorics was not printed until January 1519 implies that it had basically been completed before Melanchthon moved to Wittenberg in August 1518 and before he came into contact with Luther's theological ideas. This means that the early history of hermeneutics is not just due to the impulse of the Protestant scriptural principle but to the new concept of Melanchthon's rhetorics, which was unmistakably suitable to explicate the scriptural principle scientifically. Melanchthon's theory of rhetorics was highly popular, both among his students and especially also beyond the boundaries of the developing confessions.

Abstract

A major figure of the Scottish Reformation, a founder of Presbyterianism, and intellectual

force behind educational reforms at the Universities of Glasgow, St Andrews, and Sedan, Andrew Melville was a fierce defender of the independence of the church from government control in Scotland. His reputation as a scholar of languages, the Bible, Aristotle, and critic of royal encroachments on the church led him into direct interaction with famous theologians like Theodore Beza and into confrontation with King James VI of Scotland (James I of England). His replacement of bishops with local presbyteries established a new norm of church governance in Scotland that continues to the present day and impacted church structure throughout a wide range of Protestant movements.

Biography

Born in the Scottish village of Baldovie in 1545, Andrew Melville was orphaned at an early age and raised by his elder brother Richard. At a young age, he studied at the grammar school in nearby Montrose and gained knowledge of Latin before going on to further study of Greek. Upon his arrival at the University of St Andrews, he astonished his teachers with his ability to quote Aristotle directly from the Greek, which was a mark of great distinction at that time. Later, he studied in France under Peter Ramus, learning a system of logic which was to prove influential in his later educational reforms, before moving on to his first teaching post in Poitiers. After 3 years, Melville left France to go to Geneva, which was much safer for Protestant ideas and thinkers at that time, where he met the Calvinist theologian Theodore Beza. Beza ensured that Andrew Melville was gainfully employed at the academy, and during his 5 years there, Melville taught and further widened his knowledge of languages. Melville returned to Scotland where he was an enormously influential force in higher education and the Church of Scotland for over 30 years.

From the age of 29 until his imprisonment in the Tower of London when he was 61, Melville served as Principal of the University of Glasgow, helped reform teaching at the University of Aberdeen, was Principal of St Mary's College at the University of St

Andrews, and was further influential in the ideas that established the University of Edinburgh. Although the logic of Peter Ramus has not remained an influential field of philosophical study, his influence on Melville had substantial implications for higher education in Scotland. Rather than relying on rote learning, this logical system was engaged with Aristotle with a critical eye to peeling back layers of Scholastic accretion to try to find the true essential Aristotle as seen in his primary texts. As it was ministers in particular whom Andrew Melville was interested in training, this new approach to education in Scottish universities quite naturally filtered into the Church of Scotland via the high number of its ministers who were trained in institutions that were fundamentally shaped by Melville's pedagogy.

The juxtaposition of Melville as a philosopher and educational figure with his role as a theologian and leader of the Scottish church is one which necessarily recognizes the overlapping roles that state, educational, and clerical institutions had at this time. Quite famously, this overlap of roles got Melville into considerable legal difficulty as he refused to moderate his positions on church independence in the light of perceived abuses on the part of King James VI (King James I of England). As related by his nephew James, Melville spoke so freely to the king that he even called him "God's sillie vassal." Whether due to impertinence or his continuing opposition to the king's attempt to reassert control over the Scottish church through the reintroduction of bishops, Melville was ultimately summoned to London in 1606 to assist the king in bringing peace between church and state. After a word leaked of a Latin poem he composed mocking the worship practices at Hampton Court, he was imprisoned in the Tower of London for 4 years, after which he was released to take up a position at the Academy of Sedan in France. Melville remained there for the remainder of his life.

Heritage and Rupture with Tradition

In theological terms, Melville remained largely within the Calvinism espoused by his famous

predecessor John Knox. This theology was tempered, however, with a cosmopolitan, humanist, and critical Aristotelian background that made his work as an educator and university administrator far more original. Furthermore, his political context brought him into constant collision with the emergent British state as James VI (I) tried to bring his Scottish and English kingdoms into a more unified religious and political coexistence. Here Melville embraces the idea of a salvational role for Britain and its king as a land free from domination of the Catholic Church practicing true Christian religion and spreading this good news to its empire. However, this theoretical godly kingdom of Britannia frequently ran up against the reality of a king who was glad to adopt the more English idea of monarchical supremacy over the church. The relative egalitarianism of Scottish Presbyterianism was as essential to Melville as it was repulsive to King James.

Impact and Legacy

Andrew Melville's impact, as stated previously, is most widely expressed in the development of the Calvinist kirk of John Knox into the Presbyterian Church that retains the belief in the supremacy of Scripture, but combines it with an egalitarian vision of self-government within the church. His ability to read the Bible in its original languages and to engage with Greek thought led him to radically alter the type of education provided in Scottish universities over the course of his lengthy career. Rote memory and didactic instruction were replaced with exegesis and critical analysis. Scotland's ancient universities and its church remain deeply indebted to his commitment to logic, education, and equality before God.

Abstract

The art of memory derives its name from the Greek myth of Mnemonise, daughter of Uranus and Gaea. It aims to allow individuals to remember things, words, and concepts. It is based on a use of places and images easily identifiable by the imagination.

In the Renaissance, this art has an extraordinary impact. In the fifteenth century, the best-known book of the art of memory is *Phoenix seu artificiosa memoria* by Peter Tommai of Ravenna, a book published in Venice in 1491. This book greatly influences the treatises of this kind throughout the Renaissance and assumes an important role also in the reflection of Giordano Bruno. Peter Tommai’s text is built on the tradition of Cicero. More than on searching for “places,” he insists on the role played by the images.

Especially in the sixteenth century, the function and the significance of the art of memory begin to mutate. After meeting with the tradition of Lullism (which had known great success in the Middle Ages, especially in the Franciscan order), the art of memory becomes primarily a “clavis universalis” of reality. It aims to decipher the world as a whole and penetrates its secrets. The art of memory becomes, therefore, a “cosmology.”

At the beginning of the seventeenth century, the original purpose of the techniques of artificial memory is completely mutated. On the one hand, the art of memory loses all contact with the dialectic, rhetoric, and medicine, becoming a “pansophia”: a universal knowledge that can

decipher the “alphabet of the world”; an “encyclopedic” theatre that has the ambition to be the “mirror” of reality. On the other hand, already starting from intellectual experiences of Ramo, Bacon, and Descartes, the original meaning of this art radically changes, making his entrance into the context of modern logic.

Heritage and Rupture with the Tradition

The art of memory derives its name from the Greek myth of Mnemonise, daughter of Uranus and Gaea. It aims to allow individuals to remember things, words, and concepts. It is based on a use of places and images easily identifiable by the imagination. One must create in the mind, through the *vis imaginativa*, “images-places” that replicate real-world environments. Subsequently, the “images-symbols” should be placed in these “images-places” (Cambi 2016).

From antiquity to the Renaissance, the art of memory is widely practiced. Among his most celebrated theorists in the ancient world are Aristotle, Cicero, and Quintilian. In the Renaissance, the art of memory has an extraordinary impact. However, there are also influential critics of this art. Erasmus believes that the techniques of this art take away space for memory. Montaigne believes that the art of memory produces false knowledge. In Chapter 10 of the *De vanitate scientiarum*, Cornelius Agrippa condemns it as a vain art (Yates 1966).

In the fifteenth century, the best-known book on the art of memory is *Phoenix seu artificiosa memoria* by Peter Tommai of Ravenna, a book published in Venice in 1491 (Tommai 1491). A law professor in Bologna, Ferrara, Pavia, Pistoia, and Padua, Peter is helping to spread the interest in the art of memory in Italy. He “secularizes” this art, emphasizing its purely technical aspect (Yates 1966). His book greatly influences the treatises of this kind throughout the Renaissance and assumes an important role also in the reflection of Giordano Bruno. Peter Tommai’s text is built on the tradition of Cicero. In particular, he insists on the role played by the images (Tommai 1491).

Some texts, written in the fifteenth century, are inspired by the Aristotelian tradition. These treatises attempt to derive some rules of artificial memory directly from the lessons of Aristotle. Typical in this regard is the *De nutrienda memoria* published in Naples in 1476 by Domenico De Carpanis, who aims to present the doctrines of Aristotle’s *De memoria et reminiscencia* (Rossi 1960). The authority of Thomas Aquinas is very important in the sixteenth century. Johannes Romberch is the author of the *Congestorium artificiosae memoriae* (1520), a work in which he uses several authors including Thomas Aquinas, Petrarch, Peter Tommai, and others.

Innovative and Original Aspects

Especially in the sixteenth century, the function and the significance of the art of memory begin to mutate. After meeting with the tradition of Lullism (which had known great success in the Middle Ages, especially in the Franciscan order), the art of memory becomes primarily a “clavis universalis” of reality. It aims to decipher the world as a whole and penetrates its secrets. Therefore, the art of memory becomes a “cosmology” (Rossi 1960). In this regard, the intellectual experiences of authors such as Camillo and Giordano Bruno are significant (Bruno 2009; Camillo 2015). The *ars memoriae*, which was considered mostly a rhetorical tool in the fourteenth and fifteenth centuries – useful to preachers, politicians, scholars, and practitioners – becomes the means by which the secret of reality can be identified. The legacy of the *Ars notoria* merges with that of the hermetic texts, by Giovanni Pico della Mirandola and Marsilio Ficino. The clarity of the pages of Cicero, Quintilliano, and Peter Tommai, is replaced by the Baroque taste for hieroglyphics, alphabets, symbols, images, and allegories. In Agrippa’s magic, this art takes the connotations of a *clavis* of reality (Rossi 1960). Out of these same bases, Camillo can turn the “places” of memory into “eternal” places of Hermetic wisdom. He bases his memory system on the root causes, the Sephiroth, and the Ideas: These are the “everlasting places” of his memory (Yates

1966). Meanwhile, Giordano Bruno, commentator of Lullo and innovator of *ars memoriae*, considers it as derived from the theology of Scotus Eriugena, the mysteries of Cusano, and the medicine of Paracelsus (Rossi 1960).

In Bruno's reflection, the art of memory acquires metaphysical connotations. According to Bruno, there is full correspondence between symbols and things, between the "shadows" of the mind and the world of ideas, between the mnemonic "seals" and the structures of causes and effect in the physical world (Rossi 1960). This setting does not prevent the art of memory from also playing practical and educational functions. Bruno's reform plans to greatly expand the ability of man to exercise its dominance. This is possible thanks to a "total system" that puts an end to the fragmentation of the individual science (Yates 1966; Rossi 1960).

The art of memory of the Neapolitan philosopher Giambattista Della Porta (1535–1615) has different characteristics from those of Bruno and Camillo (Yates 1966; Maggi 2012; Verardi 2017, 2018). For Della Porta, this art neither has the function of *clavis universalis* of reality nor aims to contribute to the encyclopedic or magical knowledge. Della Porta publishes his *Art of remembering* in 1566, that is, 8 years after the successful edition in four books of the *Magia naturalis* (1558). The art of memory is linked to the humble role of mnemotechnics, based on the classical tradition of Cicero and Quintilian. The art of memory must, in fact, remember things, words, and concepts. This is made possible through places and images. Della Porta invites the reader to "see" the text, to transpose it into images, creating a true "mental theater," a painting created by *vis imaginativa* on the canvas of the memory (Della Porta 1566, 1602, 2012). In line with the Baroque sensibility of his time, Della Porta does not hesitate to recommend the use of hieroglyphics (Maggi 2012; Cambi 2016).

Impact and Legacy

At the beginning of the seventeenth century, the original purpose of the techniques of artificial

memory is now completely mutated. On the one hand, the art of memory loses all contact with the dialectic, rhetoric, and medicine, becoming a "pansophia": a universal knowledge that can decipher the "alphabet of the world"; an "encyclopedic" theatre that has the ambition to be the "mirror" of reality. On the other hand, already starting from the intellectual experiences of Ramo, Francis Bacon, and Descartes, the original meaning of this art radically changes, making his entrance in the context of modern logic. The art of memory is inserted in the context of a doctrine of scientific method. Referring to a "logical calculus" and mathematical "symbolism", Leibniz gives a fatal blow to those "symbols" construed as "animated paintings produced by imagination." With Leibniz and his works, an entire world disappears (Rossi 1960, 1991).

M. studied in a Talmud Torah, and in 1622, he became a Rabbi of the synagogue Neve Shalom. In 1627, he opened the first Hebrew press in Amsterdam. Among his main works are the *Conciliador* (1632–1651), where he tries to rectify the inconsistencies of the sacred text using his Talmudic, Midrashic, and Kabbalistic knowledge. In 1651, he wrote an open letter to Oliver Cromwell (1599–1658), asking him to readmit the Jews to England. In 1655, he moved to England in order to plead in defense of the Jewish settlement there.

Abstract

Menasseh ben Israel (1604–1657) was born into a Marrano family and is usually remembered for his commitment to the cause of the readmission of the Jews in England. His works played a pivotal role in debates about Jewish emancipation in the Enlightenment period in Germany.

Biography

Menasseh ben Israel (1604–1657) was born in Lisbon into a Marrano family. He was baptized and bore a Christian name, Manuel Dias Soeiro. In the wake of the Inquisition's persecutions, the whole family moved to Amsterdam where they got involved in the Jewish life of the city.

Heritage and Rupture with the Tradition

Menasseh ben Israel is usually remembered for his commitment to the cause of the readmission of the Jews in England. This commitment possibly stemmed from his messianic speculations. He was convinced that the ten lost tribes of Israel were located in the newly discovered America. He also thought that redemption would finally come only when the dispersion of the Jews would affect the whole earth. These two elements play an essential role in his *Humble Addresses* and in his *The Hope of Israel*. In his *Humble Addresses* to Oliver Cromwell, he argues that in allowing the return of the Jews to England, the English people will participate in the divine blessing bestowed upon Israel and that they will contribute to hastening the redemption by supporting the Jewish dispersion in the world. Nonetheless, Menasseh ben Israel also paid attention to the earthly economical dimension of his pleading. In fact, he borrowed some of the economic ideas and arguments that Rabbi Simone Luzzatto (1583?–1663) had previously articulated in his *Discorso circa lo stato degli Hebrei et in particular dimoranti nell'inclita città di Venezia* (1638), namely, that the Jews can contribute to the English economy with their skills and talents (Ravid 1982). His devotion to the Jewish cause was not exhausted yet. In his *Vindiciae Judaeorum* (*Vindications of the Jews*, 1656), he defended the Jews against false and superstitious accusations, such as blood libels, and against other prejudices such as those of

practicing idolatry during the religious service in the synagogues and cursing the Christians while praying.

Menasseh ben Israel's work enjoyed great appreciation in the following centuries. It influenced John Toland's *Reasons for Naturalising the Jews* (1714) (Bernardini 1998, 79–78). In 1782, Moses Mendelssohn translated the *Vindications of the Jews* into German and wrote an introduction to it (Sorkin 1987, 68–69). The text played a pivotal role in debates about Jewish emancipation in the Enlightenment period in Germany.

Abstract

Pedro Hurtado de Mendoza, S.J., was a Spanish Jesuit philosopher who lived and worked in Spain. He joined the Society of Jesus at a relatively early age and took his studies at the University of Salamanca. After his ordination, Hurtado taught philosophy at Pamplona for a couple of years before moving to Salamanca where he taught theology for nearly 30 years. During his time as a theology professor, in 1615 Hurtado published his principal work, the *Disputationes a summulis ad metaphysicam*. This work would undergo two revisions, and was republished in 1624 as *Universa philosophia*. Later in his career, Hurtado focused on moral issues and even found himself in a dispute with the moral extravagances of the theater. In 1631 Hurtado published his *Disputationes morales et scholasticae de fide*. Around 10 years later, Hurtado died in Madrid in 1641.

Biography

Pedro Hurtado de Mendoza, S.J. (1578, Valmaseda–10 November 1641, Madrid), was born in Valmaseda, about 30 km from Bilbao, Spain, in 1578. Given his birth locale, Hurtado was referred to as “Valmasedano,” whose title accompanies his name in certain printings of his works. He remained in his hometown until 1595 when, only 17 years old, he joined the Society of Jesus at Salamanca on the 12th of November. Hurtado was ordained also a priest in Salamanca in 1607 (Heider 2014, 87) but made his Jesuit profession of four vows on 5 February 1612 in Valladolid (Schmutz 2014).

Early in his career, Hurtado studied at the Jesuit College of Salamanca, but then from 1608 to 1611, he taught philosophy at the College of Pamplona. After his stint as a professor of philosophy, Hurtado taught theology for the next 30 years at Salamanca and simultaneously worked for the Holy Office (or Inquisition) as a censor. During his time as a professor of theology (around 1615), Hurtado published a complete course on philosophy, the *Disputationes a summulis ad metaphysicam*, which addressed various philosophical topics ranging from logic to metaphysics. The work underwent several editions and had a profound impact on the Protestant world, more so even than Francisco Suárez, whose influence upon Protestant scholastics is no small matter (Schmutz 2014). Two years later, in 1617, Hurtado published a second edition of this work called the *Disputationes universa philosophia* in Lyon (Heider 2014, 87). Finally, in 1624 the last edition was published in Lyon as *Universa philosophia* (Solana 1940).

Over his lengthy teaching career, Hurtado had several important students who would become famous Jesuit philosophers in their own right, namely, Richardus Lynch, Antonio Pérez, and Rodrigo Arriaga, to name a few (Schmutz). In 1631 Hurtado published his *Disputationes morales et scholasticae de fide* in which, interestingly, he attacked the permissive moral attitudes that were on display in theatrical performances of his time. This work generated some controversy between the Jesuits, who sided with Hurtado, and apologists of theatrical communities (Schmutz 2014).

Universa Philosophia

Hurtado's *Universa philosophia*, composed of three tomes, is comprehensive in scope. The first tome contains his own *Tractatus de summulis* – running over five disputations – and his logic which is composed of 11 disputations. In the *Tractatus de summulis*, Hurtado explores the nature of the terms of a proposition as well as their union (disp. 1), the properties of terms such as supposition and appellation (disp. 2),

oration (disp. 3), propositions and their character (disp. 4), and the mode of knowing in which are treated various forms of argument and syllogism (disp. 5).

In the disputations devoted to Hurtado's logic, not unlike other scholastics such as Soto, Poinset, etc., the Jesuit identifies beings of reason as the proper object of logic (*Logica*, d. 1, 1, 45–52; fol. 52). Hurtado's theory of *entia rationis* represents a significant development in Baroque scholasticism in general and over Suárez in particular. Hurtado claims that some *entia rationis* can be actualized in reality, for example, those beings of reason that result from a false judgment not implying a contradiction. To this claim, he also adds, somewhat counterintuitively, that those beings that are contradictory yet serve as truth-makers in a proposition (e.g., square-circles in the proposition "Square-circles do not exist") are not in fact beings of reason, for the reason that they presuppose "false judgments." These judgments pertain to contradictory being through which some sort of being or reality is attributed to the contradictory being (Novotný 2013, pp. 116–117). Developing his position further, Hurtado holds that those *entia rationis* that stem from erroneous affirmations of contingently false judgments only have a verbally significative value (ibid., pp. 132–333). The heart of Hurtado's position consists, then, in his claim that *entia rationis* ultimately result from the human intellect's "fallibility."

Regarding analogy, Hurtado agrees with Suárez in many respects and thinks that it is better to forsake analogy than lose the unity of the concept of being (*Logica*, d. 9, s. 3.34; fol. 115). Of course, neither alternative needs to be sacrificed, and so in disagreement with Gabriel Vázquez but, again, in agreement with Suárez, Hurtado denies that the concept of being is univocal. Hurtado holds that there is one concept of being that is abstracted from its inferior, viz., from a substance, accidents, God, and creatures (ibid., 3.41; fol. 116). This abstraction from its inferior is crucial in order that the concept of being may be common to all particular beings (ibid.). Nevertheless, Hurtado denies that the concept of being is univocal and instead identifies it as analogical. Here, the Jesuit advances reasons similar to Suárez, who

maintains that the concept of being results from a "confused" cognition of being. That is, the particular *rationes* of various beings are not really distinct from being itself; nevertheless, these *rationes* are not directly grasped themselves when one apprehends being confused. So, for example, just as when one views an animal at a distance, Hurtado explains, one cannot yet distinguish whether that animal is a man or a mere brute animal. Neither specific difference (i.e., rational or irrational) is explicitly entertained nor is it expressly denied. Similarly, in conceiving "being," Hurtado thinks that one only "conceives an aptitude to being [*concupere aptitudinem ad essendum*]" and not the distinct *rationes* of substance or accident.

As Hurtado sees it, "the concept of being is not outside of [extra] the concept of substance in the way that rational is outside the concept of animal" (ibid., 5.75; fol. 119). Accordingly, continues Hurtado, there are not two concepts in the concept of substance (viz., the concept of being and the proper concept of substance) but one concept. But the concept of being as abstracted from the concept of a substance is unequal to that as drawn from an accident, for the former is superior to the latter (ibid.). This difference, according to Hurtado, constitutes the essence of transcendental analogy, for, as he says, this transcendental concept (of being) is not entirely the same nor entirely different. When the concept of being is conceived according to a common character, it is the same since "no dissimilitude appears," but when it is conceived from its inferior, there is some dissimilarity that arises, for the concept of being as taken from a substance is superior that drawn from an accident (ibid., 5.76; fol. 120).

The second tome of Hurtado's *Universa philosophia*, by far the longest, is spread out across four subsections in which the gamut of Hurtado's natural philosophy is presented. The first section pertains to corporeal substances in general and particular; the second – and briefest – section (composed of only three disputations) concerns incorruptible substances (or the heavens); the third section treats the generation and corruption of substances; and, finally, the

fourth section deals with animate beings. The first subsection explores the basic principles of nature such as prime matter (disp. 2), privation (disp. 3), substantial forms (disp. 4), the union of form and matter (disp. 5), composition (disp. 6), causes in general (disp. 8), efficient creative causes (disp. 9), and the first cause (disp. 10). The remaining disputations explore the themes raised in the final books of the *Physics* – such as motion, action, passion (disp. 11), infinitude (disp. 13), and place (disp. 14) – together with the properly Christian theme of creation (disp. 12). Hurtado finds it appropriate to discuss creation within the context of his philosophy of nature since “it is the proper causality of the first cause” (*Phys.*, d. 12. prol.; fol. 297).

In his discussion of the nature of creation, Hurtado follows Thomas in holding that creation is the “production of being from nothing [*ex nihilo*]” (ibid., 12.1.1; fol. 297), but, for Hurtado, the question here is: What is the meaning of *ex nihilo*? The Jesuit disagrees with the “common” opinion that it means repugnance or non-repugnance. It is not repugnant that something should be made, he says, nor is non-repugnance, Hurtado holds in agreement with Vázquez, since non-repugnance remains regardless of whether something’s being created or not. Additionally, *nihilo* is something more than the mere “non-actuality” or “nonexistence” of a thing. He concludes therefore that *ex nihilo* signifies producing being without some concurrent subject or intrinsic form of something (ibid.). The metaphysical status of the being prior to its creation is a concern Hurtado will address in his discussion on possibility in the metaphysical portion of his *Universa philosophia*.

In the third and last tome of his *Universa philosophia*, Hurtado develops his metaphysics in a study of “transnatural being,” those beings distinguished from the objects studied in the philosophy of matter through their abstraction from matter. This discussion runs throughout 20 disputations. Perhaps one of the most interesting features of Hurtado’s metaphysics is his understanding of creaturely possibility, which he

unfolds in his discussion of the relationship between essence and existence in Disputation 8 (Coombs 2003, 19ff). First, he explains that *essentia* is “an objective concept which is apprehended by us, when we form a concept of some thing” (*Metaph.*, d. 8, prol., § 1; fols. 826–27). Then, he notes that *existentia*, “drawn from the word *existo*, is the same as essence . . . for *existere* and *esse* are synonymous” (ibid., fol. 827). In raising the topic of the relationship between *essentia* and *existentia*, Hurtado first inquires what it means for a creature to be possible (sec. 1). To unfold the question, he considers two kinds of possible creatures: first, an actually existing creature – Peter, to use his example – who though he exists need not have been, and, second, an angel – again, to use Hurtado’s example – who “is not created, was not created, and never will be created” but for whom, nevertheless, it is possible for God to create (ibid., 8.1.2; fol. 827). One might inquire into what that creature’s possibility stems? Hurtado answers that “the denomination ‘possible’ is taken formally from God’s omnipotence” (ibid., 8.1.3; fol. 827). Possibility, then, would seem to be something extrinsic to the creature itself and a matter of God’s own creative power. Yet, Hurtado complicates his account when he adds that the possibility of a creature is in a thing “really distinct from God” (ibid., 8.1.5; fol. 827). Hurtado’s concern here is to differentiate himself from Jan Hus (c. 1369–1415) and John Wycliffe (1320–1384), who were condemned as heretics for holding that “all being is God” (*Metaph.* 8.1.5; fol. 827). If God is not all things, then all must be distinct from the divine being (and power), even those beings whose being is merely that of possibility (Coombs 2003, 213–15). The power to produce something physically (e.g., God’s omnipotence) is directed to something other than and really distinct from itself, explains Hurtado, since “it is in the definition or character of ‘having-been-made’ [*ratio factivae*] that it stand in relation to that which is able to be made [*respicit id quod potest fieri*]” (*Metaph.* 8.1.5; fol. 827). Divine omnipotence, concludes Hurtado, is precisely such a power to create, and thus it is referred to something

makeable (*factibilie*) as something really distinct from itself (*ibid.*).

cognitive processes governing speculative activity in a non-discursive way. Mind is always distinguished from reason, which indicates the reworking process of the sensitive species provided by the senses and of the *Fantasmata* provided by the imagination. Some Platonic scholars use the term “mind” as a synonym for “intellect,” while for the Averroist ones, it stands for the unity of the intellectual faculties. During this period Augustine’s notion of mind-soul has been philosophically reworked along with an effort at combining it with the Aristotelian model (intellectual powers). Some Renaissance philosophers have rejected Augustine’s notion to devise new original conceptions of mind-soul, reworking the late ancient philosophy, such as the Alessandrinites. Averroist philosophers from the Universities of Paris, Padua, and Bologna have also affirmed the doctrine of the mortality of mind-soul.

Term

In Renaissance philosophy, the term “mind” is mostly used to indicate the unity of the cognitive processes governing speculative activity in a non-discursive way. However, its use is not homogeneous in this age. Some Platonic scholars use the term “mind” as a synonym for “intellect,” while for Averroists, it stands for the unity of the intellectual faculties, i.e., reason, potential intellect, and agent intellect.

Heritage and Rupture with the Tradition

Augustine of Hippo translates Origen’s *nous* into Latin as *mens*. Thereby he affects the Middle Ages philosophical vocabulary. Augustine identifies three kinds of mind, i.e., divine, angelic, and human, and infers the human mind immortality from its being *imago Dei*. Such a view has dominated the Middle Ages and still in the Renaissance Girolamo Seripando and Giles of Viterbo talk of “mind” in Augustine’s sense. However, in

Abstract

In Renaissance philosophy, the term “mind” is mostly used to indicate the unity of the

the thirteenth century, Augustine's model goes into crisis because of the dissemination within the University of Paris of Aristotle's *De anima* and its interpretations by Averroes and his Latin epigones. The Averroists defend a materialist conception of the intellectual process, claim the mortality of the mind, and reject Augustine's view of man as image of God. Their ideas take root also in the Renaissance (Martin 2013). Among the fifteenth-century Aristotelians, similar doctrines are found in George of Trebizond's writings (Monfasani 1976). In particular, in the fifteenth- and sixteenth-century universities, the mortality of mind is acknowledged by the Averroists from Padua, such as Nicoletto Vernia, Paul of Venice, Cajetan of Thiene, and Agostino Nifo (Spruit 2013). Yet Pietro Pomponazzi develops the hierarchy of minds doctrine in line with the Augustinian tradition (Pomponazzi 1516). Pomponazzi's Averroism is also mitigated by its reference to Thomas Aquinas' psychology (Valverde 2012; Perrone Compagni 2005). A third group of philosophers, among whom Nicholas of Cusa, Marsilio Ficino, and Pico della Mirandola, rework Augustine's notion of mind relating to the doctrine of man as "second God," borrowed from Hermes Trismegistus' *Asclepius*. Such pagan and hermetic revision of the concept of mind breaks in some respects the continuity with Averroism (Allen 2010).

Innovative and Original Aspects

The Renaissance philosophy of mind has mostly developed along the lines of the medieval tradition, drawing from the Augustinian, the Aristotelian-Averroist, and the Alessandrinish school. Augustinism is mainly endorsed by religious orders and Roman humanists, whereas Averroism and Alessandrinishism are preferred in the universities, where, in the sixteenth century, they reach their apogee (Forlivesi 2013). Innovation and originality are mostly owed to authors who do not belong to any religious order or university. In *De mente*, Nicholas of Cusa provides an original interpretation

of Augustine's notion of mind. On the one hand, Nicholas of Cusa belongs to the Medieval Tradition, since he argues that our mind is an image of God; on the other hand, he pursues innovation, since he claims that our mind is able to create notional entities, which do not occur in nature, just as God creates real entities. Human mind creations are culture, institutions and arts. Cusanus states that the ability to create notional entities makes man a "second God" (Pico della Mirandola 1486). In this doctrine the influence of Hermes Trismegistus' *Asclepius* is clear. Similarly to Nicholas of Cusa, in the *Oratio de hominis dignitate*, Pico della Mirandola claims that the gnosiological capacities of mind can make man a second God (Flasch 1980). In the Renaissance, there are also attempts at redefining the term "mind" in relation to Aristotelian psychology. Marsilio Ficino, Pico della Mirandola, and Giordano Bruno formulate several numbers of doctrines on the relation between mind and other faculties, such as reason and senses, and with powers such as imagination, fantasy, and memory (Ficino 1484; Bruno 1582; Ciliberto 1996; Tirinnanzi 2000; Rabassini 2007).

Impact and Legacy

In the wake of Cartesian dualism, in the modern age, this kind of debate on mind loses its philosophical appeal. Only a few single Renaissance issues survived, such as the relationship between rationality and discursive thought or between mind and corporeal perception, but they are mostly reformulated according to the Cartesian model, which construes mind as *res cogitans* and reopens the problem of dualism. Nevertheless, the Renaissance debate leaves to the modern age a rich philosophical heritage. Nicholas of Cusa's concept of mind has influenced Charles Bovelles' and Leibniz's philosophy (Meier-Oeser 1989). Some historians of philosophy have even argued that the Renaissance hermetic reworking of the notion of mind has a role in the constitution of the German Enlightenment (Mulsow 2002).

Abstract

Judah Messer Leon was probably fifteenth-century Italy's best Jewish exemplar of a *hakham kolel* or *homo universalis*. He was a

rabbi, halakhic decisor, teacher, academy head, doctor, and author. He may have been the most decorated Jew in Italy, receiving not only the title “Messer” but also a doctorate. His written works include poetry, prayers, medical treatises, treatises on grammar, logic, and rhetoric, and commentaries on Aristotle, Averroes, Maimonides, and the Bible. His treatise on rhetoric, *Nofet şufim* (*The Honeycomb’s Flow*), which combined the “old rhetoric” of Aristotle and Averroes, the “new rhetoric” of Cicero, and interpretations of Biblical texts as rhetoric, was an important precursor to the interest in rhetoric among Italian humanists. His philosophical commentaries critiqued older interpretations of Aristotle by Gersonides in favor of scholastic interpretations and then current at the University of Padua. Taken together, his works sought to portray a unified Judaism in which ritual and scripture were understood to cohere with a philosophical approach to knowledge of the world. In his academies, he promoted the view, probably influenced by Paduan scholasticism, that students should engage in the study of both religious and philosophical texts, though only combining these ideas at the very end of their studies when turning to Maimonides, Jedaiah Bedersi, and others. His greatest influence was probably through his son, David, whose writings became prominent in the Ottoman lands, and his students, the most famous of whom was Yohanan Alemanno, Hebrew tutor to Giovanni Pico della Mirandola.

Biography

Little is known about the life of Messer Leon, which was apparently spent in various cities throughout Italy. It is not clear whether he was born in the Montecchio of the Le Marche region or in Montecchio Maggiore. He lived, studied,

and taught in Ancona, Bologna, Padua, Venice, Mantua, and Naples. He was ordained as a rabbi in his 20s and likely received a medical degree at a university in the same decade. Before turning 30, he seems to have already been appointed the head of the Jewish *yeshivah* in Ancona, where he wrote his first two books, *Libnat ha-sappir* (*Sapphire Stone*) and *Mikhlal yofi* (*The Perfection of Beauty*). He probably received the title “Messer” from the German emperor Fredrick III (1415–1493) on his visit to Italy in 1452. The title was apparently a source of pride for Leon; he mentions it in Hebrew transliteration at the opening of all of his works, though he tempers it somewhat by also adding to his name the epithet “the lowly servant, the faithful lover” (*ha-‘ebed ha-qatan ha-’oheb ha-ne’eman*). By the late 1450s, Messer Leon had moved to Bologna, where he was again head of a *yeshivah* and also began to write Hebrew commentaries on Aristotle. The subsequent decade saw him in Padua, where in 1469 he received the title “Doctor,” and along with it the knighthood and its concomitant titles of *miles*, *dignitas*, and *nobilitas* from the Emperor at the University of Padua. The University had already then informally opened its doors to noncitizens, even though it would not formally do so until 1517, when it reopened after the Venetian conquest of the area in 1509. Messer Leon apparently did not refer to himself with these titles in his Hebrew writings. Nevertheless, this status permitted Messer Leon not only to treat Christian patients but also to award his own doctoral degrees. Accordingly, he conferred such degrees on his students, e.g., John Alemanno and Baruch de Galis, as early as 1470. After a few years in Venice, he moved to Mantua before 1473, where he again headed a *yeshivah* and continued to write Hebrew commentaries on Aristotle as well as his best known work, *Nofet şufim* (*The Honeycomb’s Flow*). There he also taught Abraham Farissol (1451–ca. 1528), author of the geographical work, *Iggeret Orhot Olam* (first printed in Ferrara in 1524), which is the first Hebrew work to discuss the New World in detail. By the early 1480s, Messer Leon moved to head an academy in Naples, probably drawn by King Ferdinand I’s encouraging Jews to settle there.

However, in 1495 Charles VIII, King of France, conquered Naples, resulting in the destruction of the Jewish community there. Judah Messer Leon either died from this destruction or else fled with his son, David, to Monastir, Macedonia, then under the Ottoman Empire, where he died before 1499.

Why did Messer Leon lead such an itinerant life? Some of his relocations may be due to his pursuit of learning in Latin and the small, frequently shifting number of places where such learning would be permitted to Jews. Additionally, frequent wars and changes in the rights of Jews, especially those practicing medicine, also encouraged these moves, which were probably accompanied by students and perhaps their families. Yet he was also involved in a number of disputes within the Jewish community that may have encouraged his relocations. These were likely due to his own efforts to establish his authority over Italian Jewry, which included not only Italian Jews but also German and French Ashkenazim as well as Sephardim who were arriving from Spain throughout his lifetime. Messer Leon's approach was to encourage the adoption of Ashkenazic customs and *halakhah* while viciously disputing Ashkenazic and French philosophical and theological views. Not only was Messer Leon opposed to the Kabbalah, he even decreed a ban against studying Gersonides' commentary on the Bible, which was popular among Ashkenazic Jews in North Italy. He also dismissed a Sephardic teacher of Narboni's commentary on Ghazali from his academy in Mantua and subsequently defamed him for heretical teachings. Another account has Messer Leon in a dispute with the *halakhic* decisor and exegete, Joseph Colon Trabotto (ca. 1420–1480), called *Maharik* and known primarily for his responsa, regarding appropriate dress that resulted in the expulsion of both of the disputants from Mantua by order of the Duke, but the accuracy of this account is questionable. In any case, such disputes along with the changing status of Italian Jews not only contributed to Messer Leon's itinerant life but also likely prohibited him from establishing an enduring academy of learning.

Works and Themes

Much of Messer Leon's prolific writing was likely directed at students in his academies. Messer Leon himself frequently refers to students and takes pains to present his work as following the proper order of learning. No program of study from any of Messer Leon's academies survives, but a recommended program of study of his student, Yohanan Alemanno (1435/8–after 1504), is extant, and it is possible to gain a fairly comprehensive understanding of the education of Messer Leon's son, David. From these one can see the great importance attached to the *trivium*, the study of grammar, logic, and rhetoric; the much smaller attention given to the *quadrivium*, the study of arithmetic, geometry, music, and astronomy (Alemanno, e.g., recommends studying these subjects only 2 months a year for about 7 years); and the turn to Aristotelian philosophy after these topics, followed by the subsequent reexamination of Scripture in light of philosophy. Messer Leon's writings similarly emphasize the *trivium*. His three independent Hebrew treatises, the *Libnat ha-sappir* (*Sapphire Stone*), *Mikhlah yofi* (*The Perfection of Beauty*), and *Nofet sufim* (*The Honeycomb's Flow*), are textbooks on grammar, logic, and rhetoric, respectively. Moreover, he wrote commentaries on Porphyry's *Isagoge* and Aristotle's *Categories*, *On Interpretation*, *Prior Analytics*, and *Posterior Analytics*. He does not seem to have written on any of the topics of the *quadrivium*. However, he did write commentaries on Aristotle's core philosophical texts, *Physics*, *On the Soul*, *Metaphysics*, and *Ethics*, the last three of which have not survived. Additionally, he wrote commentaries on the Bible and books of legal decisions which are not extant but were presumably for use in his academy in Naples. He also wrote a commentary on parts of Avicenna's medical *Canon* and various questions on physics and other topics, again probably with an eye to training students. Another salient feature in the advanced stages of both Alemanno's program and David's education was a strong focus on Maimonides' *Guide* and other theoretical approaches to Judaism and philosophy.

Messer Leon seems to have written commentaries on the *Guide* and on Jedaiah Bedersi's *Behinat ha-dat*.

Messer Leon's writings are all in the eclectic style popular in the Renaissance, composed largely of quotes from numerous works. Even his three independent treatises are greatly dependent on other works. The *Libnat ha-sappir* draws heavily on Abraham Ibn Ezra's grammatical works, and the *Mikhlah yofi* is mostly excerpts from various scholastic logical works, especially those of Paul of Venice (1369–1429), a scholastic thinker who taught at the University of Padua and whose logical works continued to be studied there after his death. Similarly, Messer Leon's extant commentaries on Aristotle, which like other Hebrew commentaries of the fourteenth to sixteenth centuries, take Averroes' Middle Commentaries as the text of Aristotle, engage extensively with Walter Burley, Radulphus Bruto, Gaetano de Thiene, Paul of Venice, and numerous other Latin writers studied at the University of Padua. In fact, Messer Leon is highly critical of the fourteenth-century commentary tradition, especially its lead proponent Gersonides, and refuting Gersonides' commentaries on Aristotle is a central goal of his own commentaries.

Even *Nofet şufim*, which Messer Leon recognized as his most important work and which was the first Hebrew book to be printed in the lifetime of its author, is heavily reliant on other sources. The first three books of *Nofet şufim* are structured around the pseudo-Ciceronian *Rhetorica ad Herennium*, and the final book is built off of Averroes' *Middle Commentary* on Aristotle's *Rhetoric* in the Hebrew translation of ʿTodoros ʿTodorosi. To be sure, *Nofet şufim* also drew heavily on other sources, including the pseudo-Aristotelian *Rhetorica ad Alexandrum*, Cicero's *De invention*, and Quintilian's *Institutio oratoria*. *Nofet şufim* thus made available to a Hebrew audience rhetorical concepts and classifications that had previously been accessible only in Latin. One reason for its influence was the increasing popularity of the study of rhetoric with the advent of Renaissance Humanism. *Nofet şufim* is, in fact, set apart from its sources by its most radical feature: its use of examples from the

Bible and its explicit claim that the Hebrew Scriptures constitute the highest form of rhetoric. God Himself, according to this view, is an Orator, developing His claims through rhetorical methods and convincing the people to adopt correct opinions and to live in the best possible way.

One important theme that comes up in Messer Leon's introductions to his various works is that of a unity of knowledge, i.e., of philosophy and Scriptural truths. This may be based on an Averroism picked up in Padua. Yet, Messer Leon draws on medieval Jewish sources, especially Maimonides, for the legend of an ancient, comprehensive understanding of the Hebrew Scriptures that derived from them a complete understanding of philosophy in all of its fields. The many travails suffered by Jews have caused this understanding to be lost, and Messer Leon thus turns to non-Jewish sources, especially Aristotle, Averroes, Cicero, and the Christian scholastics, to extrapolate this knowledge. Once this knowledge has been gained, according to Messer Leon, one can reread the Bible and discover that, in fact, it was there all along. In this way, Messer Leon justifies teaching non-Jewish philosophy in his *yeshivah* and even using it to better understand the Bible. Such an account allows for manifold ways of studying what is ultimately a unified, divine knowledge. It thus may be seen as a kind of *Prisca Theologia*, even without the mystical and magical elements so important to Marsilio Ficino.

Impact and Legacy

If Messer Leon's life's work was to construct a Judaism that harmonized philosophy and religion and to promote the study of philosophical works and an understanding of Hebrew Scriptures in light of those philosophical inquiries, then it was largely a failure. Subsequent generations generally turned away from this approach in favor of kabbalistic interpretations of Judaism. Even his son, David, brought in the Kabbalah to his accounts of Judaism. Indeed, later Jewish thinkers slowly turned away from Aristotelian philosophy as a source of reasoned truth, in favor of the

kabbalah, renaissance Platonism, or new scientific methods. Messer Leon's lengthy and detailed interpretations of Aristotle and Averroes in light of scholastic writings, which made up the bulk of his literary output, were in a sense the apex of the Hebrew commentary tradition. Yet that tradition petered out in the generation after Messer Leon's death, and the production of Hebrew commentaries on Aristotelian texts ceased entirely in the second half of the sixteenth century. At the same time, Messer Leon's work on rhetoric was of increasing interest as Jewish thinkers became interested in humanism and Platonism. Even later, his work may have been influential in the reexamination of the Bible beginning with Spinoza who envisioned the prophets as orators with political goals.

Although his academies apparently had no lasting influence, Messer Leon was influential through his students. His son, David, was quite prolific and influential on Jewish thought in the Ottoman lands. His most important student, though, was probably Yohanan Alemanno, whose approach to a unified intellectual understanding of Judaism and philosophy is greatly indebted to Messer Leon. Alemanno is best known as the Hebrew and Jewish thought teacher of Giovanni Pico della Mirandola, and it is through Alemanno that Messer Leon's scholarship reached a non-Jewish audience and participated to some extent in the development of the Italian Renaissance.

Metallurgy in Renaissance Science

Andrea Bernardoni

Institute and Museum of the History of Science,
Museo Galileo, Florence, Italy

Abstract

The fourteenth century is characterized by the consolidation of the iron and steel industries. The return to the widespread use of other metals in goldsmiths and sculpture, with the development of military and civil engineering, encourages the renovation of mining, metallurgical techniques, and metal working that will lead, especially in central Europe, to the renewal and upgrading of the metallurgical mining industry. This process of renewal is accompanied by the birth and consolidation of literature dedicated to metallurgy and mining, which will mark the transition from an alchemical and artisanal dimension to the art of metal, to that of a specific field of study that finds an application in industrial activity.

Innovative and Original Aspect

Between the thirteenth and fourteenth centuries, Europe was the scenario of a progressive return to the use of metals. The urban development of cities and the consolidation of court life led to an increase in the artworks of goldsmiths, tools for daily use, and in particular military equipment. Iron was used for the construction of weapons, as parts of siege machines such as crossbows and iron rims, in shoeing horses, as agricultural tools for working the earth, and in the architecture of chains, sticks, nails, brackets, and hinges. New mines were opened in Europe, and thanks to a more efficient drainage system, it was also possible to exploit existing mines.

In Saxony and then in Bohemia, Harz, and Southern Bavaria, even more efficient water-lifting machines were experimented. Engines were driven by animal traction and where the

presence of watercourses enabled it, with powerful hydraulic motors also.

The combination of hydraulic energy and water-lifting machine signed a very important turning point in mining technology that reached its peak in the fifteenth-century Germany mining areas. Thanks to hydraulic power, it was possible to develop more efficient and powerful plants for washing and crushing minerals as well as melting furnaces.

Massive investments for the development of metallurgical activity were in the lead-silver mines of Saxony, also extended to the Trentino and Tyrolean Alpine areas, in Styria, Carinthia, Lorraine, and the Dolphinarium. At the beginning of the fourteenth century, these mining areas were already operating double-bellow pumping systems able to feed the ovens with constant airflow, and new foundry apparatus began to replace the old ferries.

For the production of iron with direct method, there was the spread of the Catalan furnaces, which, despite having ancient origins, were introduced in several parts of Europe during the late Middle Ages. The direct method, or Bloomery process, did not reach the iron melting temperatures (1538°) and separated metal from its mineral in the state of spongy and pasty forms. This product, called bloom, had to be submitted to the repeated hammering section at the forge in order to remove slag and transform it into wrought iron. Then it could also be cemented and tempered to harden its surface. The most important innovation in the steel industry was, however, the introduction of larger ovens such as the Scandinavian Osmund and the German Stückofen, cylindrical or square section ovens with a double or triple height development compared to commonly sized sleeve furnaces that barely reached 2 m.

The greater height of the ovens with a constant airflow guaranteed by the powerful hydraulic bellows favored oxidation reactions that led to the fusion of iron ore producing cast iron, an alloy which had only been obtained until then by chance, and considered low-quality iron. In the Alpine valleys, especially in Bergamo and Brescia areas, there is evidence of this kind of work dating from the thirteenth century, and this is where the

indirect method of steel production probably developed. The so-called Brescian method to obtain steel with an indirect method was based on the cast iron decarburization by repeatedly and alternately heating sessions in melted cast iron baths and hammering.

Metallurgical techniques for the separation and refinement of nonferrous metals were also developed and renewed, favoring the development of more efficient copper and silver production processes. The cupellation process, based on lead oxidation that turned it into litharge, was used for separating silver from silver-lead minerals such as galena.

During the fourteenth century in the Nuremberg area, the process of liquation was introduced (Saiger process), melting silver minerals with lead, extracting metals from the minerals and alloying together with lead, and then finally separating silver by cupellation. Another method of separation to purify precious metals is the amalgamation process with mercury. It was introduced at the beginning of the sixteenth century probably in the Venetian mining areas and spread throughout Europe. This method was based on the mercury property to pass in a liquid solution with silver, from which it was then separated again by evaporating mercury.

Along with iron, copper, especially its alloys like bronze, was increasingly applied in both artistic and military casting products; cast iron did not offer enough technological guarantees, and until the middle of the sixteenth century, the majority of artilleries were cast in bronze. This alloy changed its characteristics according to the amount of tin alloyed with copper. The so-called bell alloy had up to about 20% of tin concentration: it was more fragile, and used to cast bells because of its sonority, while the “bombarda alloy” had a low tenor of tin, about 6%, and due to its greater resistance capacity was used to cast artillery.

The development of metallurgy was also accompanied by foundry technique renewal. Air blowing systems powered by hydraulic motors were also combined with the reverberation furnaces used for the castings, leading to an increase in efficiency and productivity, which made it

possible to produce larger and more complex forms of casting.

During the fifteenth century, the indirect casting method was invented or rediscovered from antiquity. This method made it possible to produce lighter and reproducible castings. The progress in the metallurgical process and casting methods led to the creation of important arsenals able to cast a big number of artillery pieces all over Europe.

Expansion and development of genuine industrial poles for mineral extraction and production of metals facilitated the introduction of a bureaucratic apparatus for the logistics, economic, and fiscal management of mining areas. In this context, the figure of Bergmaister, a public official with the task of enforcing state regulations in the management of mines, even if they were very limited areas, was in charge of administration. This figure of the “technical officer” played a very important role in the emergence of the metallurgical literature which at the beginning of the sixteenth century saw the first two published works in the *Bergbüchlein* and the *Probierebüchlein*. The oldest *Bergbüchlein* edition seems to date back to the period between 1505 and 1510, while the *Probierebüchlein* seems to be no earlier than 1520. The *Bergbüchlein*, attributed to Ulrich von Claw, latinized Calbus Fribergius, is a general introduction to the mineral geology based on the embryological theory of minerals dating back to the stoic philosophy and the alchemist tradition. *Probierebüchlein*, instead, was an anonymous metallurgical manual in which separation techniques and metal refining methods which were known in the late fifteenth century, were compiled. During the same period, the so-called *Kunstbüchlein*, including the first book dedicated to the metallurgy of steel, *Von Stahel und Eysen*, was published in the main printing houses of Germany. These works, written in German, were remarkably successful among workmen and were reprinted several times during the first half of the sixteenth century. In this nascent literary tradition, also the works by the German naturalist and physician Georg Bauer, better known by the Latinized name of Georgio Agricola (1494–1555), have to be placed. In 1530 in Basel, his first mineralogy work titled *Bermannus* was

published. This is an important publication characterized by a historical-humanistic approach in which in a dialogical form, the result of philological research on the metallurgical and mining terminology used by the ancients is illustrated. This preliminary work culminated in 1556 with the main Agricola publication *De Re metallica*, a Latin treatise on the art of metals which had a considerable diffusion and influence among scholars and learned people as well as mining technicians and workmen, thanks also to the German translation (*Vom Bergkwerk*) that was published in Basel in 1557. In this tradition that, thanks to Agricola’s works, reaches a European dimension, two other important authors such as Vannoccio Biringuccio (1480–1539?) and Lazarus Ercker (1528–1592) have also to be considered. The first published *De la pirotechnia*, printed posthumously in 1540 in Venice. A book, written in Italian, but published twice in French before the end of the sixteenth century, and copied by several authors, was a treatise dedicated to the description of minerals, from theories and technical experiences, and it may be the most completely analytical presentation of metallurgical technology from an engineering perspective. Ercker published the *Beschreibung allerfürnemisten mineralischen Ertzt* in Prague in 1574 and compiled all the techniques for the essay, the separation, and refining of metals. The works of Ercker, Agricola, and Biringuccio were the main books dedicated to the study and to the engineering of mineralogy, metallurgy, and casting process that were the basis for these kinds of studies and professional activity for almost all the following two centuries.

Metaphysics in the Renaissance

Francesco Marrone

Dipartimento di Studi Umanistici, Università degli Studi di Bari Aldo Moro, Bari, Italy

Abstract

The Renaissance is undoubtedly a crucial moment in the history of metaphysics. The

reasons for this centrality are obviously numerous. Among them, however, two are particularly relevant. On the one hand, Renaissance authors are the first who tried to elaborate an overall synthesis of the medieval metaphysical tradition, and to organize in a systematic way a very complex and articulated matter. On the other hand, they had the merit of deeply renewing the interpretation of Aristotle's *Metaphysics* and fixing the peculiarities that will characterize metaphysics throughout the following centuries. The tradition inaugurated by Aristotle's *Metaphysics*, which had already spread widely during the Middle Ages, will never cease to exert a great fascination on the philosophers and theologians active between the end of the fourteenth and the beginning of the seventeenth century. Particularly relevant, in this perspective, are the contributions of some members of the Franciscan, Dominican, and Jesuit order, among which stand out Antonio Trombetta, Giacomino Malafossa, Nicholas of Orvaux, Gabriele Zerbi, Dominic of Flanders, Paolo Barbo (Soncinas), Giovanni Cristostomo Javelli Benito Pereira, Pedro Fonseca, and Francisco Suárez. Renaissance metaphysics involves such a wide variety of themes and issues that it is impossible to make any exhaustive synthesis. Among the most frequently debated topics, the so-called *quaestio de subiecto metaphysicae* and the inquiry about the relationship between God, separate substances, and finite being are the most fundamental.

Heritage and Rupture with the Tradition

The interest in metaphysical topics holds a prominent place within the philosophical debate of the fifteenth and sixteenth centuries – not only concerning the commentaries on Aristotle's *Metaphysics* but also by reference to a series of other textbooks and treatises that cannot immediately relate to the traditional form of commentary.

From a historical-genetic perspective, the Renaissance treatment of metaphysical issues presents a twofold characterization. On the one hand, it offers a synthesis of the scholastic interpretation

of Aristotle's thought – as is evident, for example, in Francisco Suárez's *Disputationes metaphysicae*. On the other hand, it develops the grounding principles of the science that in the seventeenth century was referred to as ontology, as is shown by the fact that during the Renaissance a wide-ranging discussion took place about the status and the subject matter of metaphysical science (in general, on this topic, cf. Forlivesi 2009).

Concerning metaphysics, accordingly, the Renaissance is undoubtedly decisive: it summarizes the acquisitions of the Medieval tradition, at the same time initiating the doctrinal evolution that would have led, in about a century, to the birth of "modern ontology." (Ferrater Mora 1963; Zimmermann 1998)

In this regard, however, a crucial point should not be overlooked. The term "ontology" first appeared in the *Ogdoas scholastica* (1606) by Jakob Lohrard (Lamanna 2006, pp. 560–561), when the Renaissance thought was moving only the first steps toward the constitution of that "general science of being" which will be codified by seventeenth- to eighteenth-century authors. Strictly speaking, therefore, Renaissance metaphysics is still carried out within the framework of the exegesis of a "text" – that is, Aristotle's *Metaphysics* – and does not address many of the issues that will become specific to modern ontology. This, however, does not mean that "Renaissance metaphysics" is not original. On closer inspection, in fact, its originality also imposes itself at a textual level. Starting from the fifteenth century, metaphysical topics are no longer dealt with solely in the context of the commentaries on Aristotle's *Metaphysics*, but begin to constitute the proper subject of treatises and other kinds of writings in which the form of the commentary leaves room for a systematic presentation of Aristotle's teaching.

The Renaissance treatment of metaphysics essentially refers to three main issues or conceptual nodes.

Node n. 1 – Renaissance authors try to formulate innovatively the classical opposition between Avicenna and Averroes' perspectives. Reworking the main acquisitions of Medieval thought, they face the determination of the subject matter of

metaphysics starting from an opposition between the "ontological" paradigm developed by Avicenna and the "theological" interpretative model commonly attributed to Averroes. According to Renaissance authors, the alternative between these *auctoritates* coincides with the alternative between two different ways of understanding the main operator of ontology, that is, its subject matter. In this regard, Avicenna states that this operator can only be *ens inquantum ens*. In his opinion, if one were to admit that the subject of metaphysics is God, one would also have to assert that God's existence cannot be demonstrated by this science. Indeed, for Aristotle, the existence of the subject of a science is either something presupposed or should be demonstrated by another science. Consequently, no science can demonstrate the existence of its subject matter (*An. Post. A*, 10, 76b11–16).

According to Avicenna, however, this is not the case for metaphysics. He attributes to this science the task of demonstrating the existence of God, with the consequence that God and his being can in no way constitute its subject matter.

Diametrically opposed to Avicenna's opinion, but for equally well-founded reasons, is the thesis approved by Averroes. In his view, it is possible and entirely legitimate to consider God and separate substances as the proper subject matter of metaphysics. Since Aristotle places the demonstration of their existence in *Physics*, it is possible, according to Averroes, to assure without any contradiction that God and separate substances are the subject matter of metaphysical science. In metaphysics, as Aristotle states, their existence is a mere prerequisite, since its demonstration is ultimately concerned with physics or natural philosophy (*Phys.* VIII, 1–3). This is, hence, the principal alternative faced by Renaissance authors who dealt with metaphysical issues. The varying forms of solving this ambivalence constitute, in fact, the different ways in which they have sought to interpret the unity of metaphysical science.

Node n. 2 – The Renaissance treatment of ontological issues poses a second alternative, which concerns the interpretation of the relationship between God and the being that is the proper subject of metaphysics (given that, as we know,

the prevailing paradigm will be the “ontological” one elaborated by Avicenna). There were two permissible interpretations in this regard: on the one hand, the thesis that God is the cause (and not a part) of the subject matter of metaphysics. This opinion was supported, for example, by Thomas Aquinas in a crucial passage of his commentary on Aristotle’s *Metaphysics*. For this reason, some interpreters of Aquinas considered this position as a typical thomist assumption. In reality, as is well known, Aquinas is also the author of some texts that consider God, like any other object, as included under the concept of being (*ens*). Regardless of the identification of the theses defended or opposed by Thomas Aquinas, there is no doubt that Renaissance authors had to confront the claim according to which the subject of metaphysics does not include God, but necessarily presupposes him as an extrinsic principle. This does not mean, however, that God does not fall within the scope of metaphysics: like any other being, God is fully considered by metaphysics, but it is not for this reason that he constitutes a true inferior of its subject matter. During the Renaissance, this opinion stood in opposition to another, according to which God is not simply the extrinsic cause of the subject of metaphysics, but is himself part of the subject as a true inferior. Under this interpretation, the notion of being includes both God and finite/categorical beings equally. This assumption was widely shared by scholastic philosophers and theologians; beginning from the thirteenth century, the relocation of God within the category of being had become almost commonplace. The “ontological” interpretation of metaphysical science and the affirmation of its transcendental nature thus became widespread.

This factor, however, did not at all compromise the possibility of alternative readings: during the Renaissance, in fact, many authors elaborated theoretical solutions aiming to succeed in ensuring the unity of metaphysics without sacrificing the primacy commonly assigned to the divine being.

Node n. 3 – The main difficulty that the commentators of Aristotle’s *Metaphysics* faced was the need to guarantee the unity that Aristotle had repeatedly identified as a prominent property of

the *subiectum scientiae*. The problem that Renaissance authors dealt with was the following: given that the subject of metaphysics is being *qua* being, how is it possible to assure its essential unity to this science if the instances that it includes are so different from each other? The *casus belli*, so to speak, was here constituted by the divine being. In this regard, the principal issue was the following: what kind of relationship must exist between the different *inferiora entis* to ensure both the unity of being and the irreducible individuality that is proper to the instances it includes?

From a historical point of view, the theory of analogical predication qualifies as a possible response to this issue. A large part of critical literature generally places this theory in the framework of theological discussions. The analogy is usually interpreted as an answer to a theological problem: how can human conceptuality and language legitimately define God’s being and properties? Indeed, the theory of analogy also has another function, distinct from and perhaps more consistent with the essential inspiration of Aristotle’s philosophical teaching. Placed in a metaphysical context, the theory of analogy assumes a rigorous ontological function. In fact, it allows to satisfy a twofold requirement: on the one hand, the need to include in the *ratio entis* not only categorial and material entities, but also God and separate substances; on the other hand, the need to prevent the subject of metaphysics from losing the unity that Aristotle considered a necessary condition for the existence of any *subiectum scientiae*.

Given that metaphysics presupposes an ontological inspiration (node n. 1) and that its subject also includes God and separate substances (node n. 2), it is necessary to admit that the relations existing between the particular beings can ground the unity of being without compromising divine transcendence. Considered from this perspective, the doctrine of analogy appears closely linked to the determination of the subject of metaphysics. This is perhaps the reason why Medieval and Renaissance authors largely investigated the relations existing between God and categorial beings. The justification of the unity of metaphysics and its subject, in fact, depends largely on this investigation.

In this sense, the opposition between univocity and analogy constitutes the theoretical framework within which Renaissance authors move. Consequently, the investigation about the unity of the subject of metaphysics (node n. 3) is not rooted, as one would expect, in the text of Aristotle's *Metaphysics*, nor does it refer to the Arabic peripatetic tradition (with particular reference to al-Fārabi, Avicenna, and Averroes). It is preferably the effect of the influence that theology has exerted on metaphysics and other sciences. Born within the framework of the Medieval discussion about the legitimacy of theological discourse, the alternative between univocity and analogy radically involves the problem concerning the unity of the subject matter of metaphysics. If one admits that God, like any other entity, has to be included under the reason of being, ontology cannot avoid addressing the problem of the relationship existing between God and categorical entities under the concept of being.

In this regard, it is not pointless to observe that the problem of the unity of the subject of metaphysics has its roots in scholastic philosophy and originates, precisely, from the opposition between the analogical models developed during the thirteenth century and the univocal one that John Duns Scotus formulated in his commentaries on the *Sentences*. For that purpose, it is quite undeniable that the spread of Scotism was a decisive factor. The insistence of Duns Scotus on the need to include God and separate substances in the subject of metaphysics and to interpret its unity as a univocal one strongly influenced the way the authors of the fifteenth and sixteenth centuries dealt with metaphysics. Starting from the mid-fourteenth century and at least until the mid-eighteenth century, the theoretical framework within which ontological issues were confronted was effectively the one developed by John Duns Scotus. All philosophers and theologians, even those who adopted more traditional positions, ended up codifying their views using the lexicon and conceptuality developed for the first time by the Scottish theologian. Duns Scotus's irruption into the philosophical scene marked a real revolution in the development of the modern science of being.

From what has been said, it is quite evident that Renaissance thought implies a deep renewal of metaphysical issues. Aristotle's *Metaphysics* became available to Renaissance thinkers after having been interpreted in the context of different traditions, and starting from divergent approaches and methods. In the preceding pages, we have limited ourselves to broadly recalling the tradition of Aristotle's *Metaphysics*. Much, nonetheless, should be said about Neoplatonic contaminations and their impact on ontological issues during the Renaissance period. It is almost self-evident, however, that the consideration of such a tradition would excessively expand the corpus of texts and the range of problems and solutions to be considered. As a result, we will limit ourselves below to giving an account of those Renaissance authors who were concerned with the general science of being since its Aristotelian origin, and who consequently placed themselves in that "direct" tradition of Aristotelianism of which we are trying to trace here a synthetic profile.

From the classical and Medieval tradition, Renaissance authors inherit three fundamental questions.

1. Does metaphysics deal with God and separate substances (thesis commonly attributed to Averroes) or with being *qua* being (thesis commonly attributed to Avicenna)? Should the subject of metaphysics be identified with the noblest kind of being or with that common being in which all beings seem to agree?
2. What is the place of the divine being in this framework? Does God constitute the extrinsic principle of being *qua* being or, like any other entity, is he a simple part of the subject of metaphysics?
3. If metaphysics deals with common being, what kind of relationship should be posited between God and other entities to guarantee the unity of its subject as well as the transcendence and the perfection of the divine being?

Renaissance commentaries and treatises devoted to metaphysics replicate these issues and formulate different solutions through the discussion of complex sets of arguments. In this

synoptic presentation, it will not be possible to evoke in detail the complex set of these discussions. Therefore, the contribution of the most influential authors will be briefly presented to offer the reader a brief account of the impact of ontological topics during the Renaissance.

Metaphysics: Theology – Ontology

The Problem of a General Science of Being During the Renaissance

The Scotist Franciscan Tradition

There is no doubt that Duns Scotus's thought exerted a significant influence on the treatment of ontological issues during the Renaissance period. Not only did he introduce some themes of primary importance in the philosophical and theological discussions, but he also profoundly transformed the vocabulary of metaphysics, thus opening the way to the birth of modern ontology.

For this reason, it is perhaps appropriate to take as a starting point the synthesis developed by some Scotists during the Renaissance. The consideration of their works represents the best way to properly acknowledge the importance of Duns Scotus's influence on modern philosophy.

From the 1330s onwards, Duns Scotus's philosophy began to spread massively throughout Europe, when some of his students started to organize the contents of his teaching in a systematic form and to edit his most influential works. In a first phase, the success of Duns Scotus's philosophy was closely linked to the diffusion of the writings of some of his pupils and followers. This was the case of his metaphysical thought, the spread of which was essentially linked to the success of the *Quaestiones super duodecim libros Metaphysicae Aristotelis* by Antonio Andrés (ca. 1280–ca. 1320). The version of Duns Scotus's metaphysical thought most widely used by late Scholastics and Renaissance authors was precisely that developed by Antonio Andrés (cf. Forlivesi 2008, pp. 242–248).

Together with Antonio Andrés' *Quaestiones*, another important contribution to the spread of Duns Scotus's thought was the birth of the Scotist

School in Padua and Paris. In Padua, in particular, the Scotist tradition was dominated by the Franciscan Antonio Trombetta (1436–1517), professor of metaphysics since 1467 and main opponent of the Dominican Thomas de Vio Cajetan (cf. Poppi 1962).

Trombetta stood within the philosophical tradition of his time as one of the most important heirs of Duns Scotus. He accepted the thesis, already valued by Antonio Andrés, according to which the subject of metaphysics is being *qua* being, that is, being insofar it is common to God and creatures. Like almost all Duns Scotus's supporters, Trombetta embraced the Scotist interpretation of metaphysics as a *scientia transcendens*, that is, as a science capable of including in its subject not only categorial entities (like creatures and finite material beings in general) but also God and separate substances (Trombetta 1502a, I, q. 9, f. 10ra-b).

Trombetta poses the problem of the subject of metaphysics in a transversal way (cf. Forlivesi 2008, pp. 265–276 and Forlivesi 2014, pp. 29–35). He does not inquire if the subject of metaphysics also includes God. As an orthodox supporter of Duns Scotus's thought, he considers this statement an acquired fact. The question he poses in his *Quaestiones metaphysicales* is another: how does metaphysics deal with the parts of its subject? And again: does the metaphysician consider the quiddities included under the concept of being in a universal way (*in universali*) or in a particular one (*in particulari*)? These questions, which are only apparently unimportant, have the purpose of explaining how metaphysics can deal with its objects without invading the respective fields of particular sciences (Trombetta 1502a, ff. 8vb–11ra).

Without entering here into the complex series of arguments elaborated by Trombetta, one can summarize his view as follows. Metaphysics is concerned with being *qua* being, that is, being insofar as it includes not only categorial entities but also God and separate substances. The metaphysician deals diversely with the different kinds of quiddities that fall under his consideration. He can take into account material quiddities in a “universal” way or a “particular” one. The

metaphysician deals with material quiddities in a universal way when he considers them insofar as they include the notion of being *qua* being (which is precisely the subject of metaphysics). Instead, he deals with material quiddities in a particular way when it considers their proper concept, but always with reference to the fact that these quiddities include being *qua* being. In this sense, the metaphysician deals with quiddities *in particulari* only in a relative way, that is, referring to the *modus considerandi* that is proper to the metaphysical habitus (Trombetta 1502a, f. 10rb).

Metaphysics, on the other hand, is concerned with separate substances (including God) not only *in universali* (insofar as they include, like material quiddities, the notion of being), but also *absolute* and *in particulari*. This particular knowledge of separate substances, however, is not attained by an intuitive concept (only possible within a theological framework), but through a proper concept that the mind elaborates by aggregating the notions that metaphysics takes into account (i.e., the concepts of body, necessity, simplicity, independence, and substance) (Trombetta 1502a, ff. 9vb-10ra).

So, what does metaphysics deal with in the theoretical framework developed by Antonio Trombetta? It deals with being *qua* being, that is, being insofar as it also includes God and separate substances.

During the Renaissance and the Early Modern Age, the supporters of Duns Scotus's thought commonly accepted Trombetta's approach. It is no coincidence, in this regard, that seventeenth-century textbooks and treatises often mention the Paduan Franciscan (together with Antonio Andrés) in order to clarify some Scotist positions. Even in the case of some disagreements concerning arguments and demonstrations, Renaissance authors considered Antonio Trombetta as a true authority. A similar treatment, in the same years, was also reserved for Pierre Tartaret (d. 1522), a Scotist philosopher active in the second half of the fifteenth century. His *Clarissima singularisque totius philosophiae necnon metaphysice Aristotelis [...] expositio*, reprinted several times since 1498, is also concerned with ontological issues (Tartaret 1498,

1514, 1614). In his commentaries, Tartaret devoted little space to the question of the subject of metaphysics. Its position, however, is clear and defined. Like Duns Scotus and his early followers, Tartaret partakes the "ontological" view developed by Avicenna, and rejects instead the "theological" framework commonly attributed to Averroes. According to his view, the subject of metaphysics is being *qua* being, that is, being insofar as it also includes God and separate substances. Although God and separate substances constitute the noblest objects taken into account by the metaphysician, they are considered in metaphysics only *sub ratione entis*, that is, as true inferiors of the concept of being (Tartaret 1498, ff. 130vb-131ra).

Another important representative of the Scotist tradition in Padua is Giacomino Malafossa (ca. 1481–1563). Born in Barge, in the province of Cuneo, Malafossa held the chair of metaphysics *in via Scoti* at the Faculty of Arts of Padua between 1518 and 1564. The contents of his teaching concerning metaphysical issues are condensed in his *Exactissima enarratio et absolutissima expositio super Primum Sententiarum Doctoris Subtilis* and primarily in his *Quaestio de subiecto metaphysicae*, published in Padua in 1553 and then reprinted in 1581, 1591, and 1613. In his *Quaestio de subiecto metaphysicae* Malafossa deals with two distinct yet interconnected issues: in the first section, as announced by the title, he ponders the subject of metaphysics; in the second one, instead, he addresses the question of its scientific statute (cf. Poppi 2009, *passim*).

Concerning the *quaestio de subiecto metaphysicae*, Malafossa discusses extensively the interpretation elaborated by Averroes, partly the one of Avicenna, and diffusely the positions of some contemporary Scotists. Following Duns Scotus, Malafossa adopts the "ontological" interpretation commonly attributed to Avicenna but integrates it into the framework of the scholastic debate. In his view, the subject of metaphysics is being as such, that is, being insofar as it equally includes God and creatures. Neither a super-transcendental being (including beings of reason) nor the most perfect being (God) can constitute

the adequate subject of metaphysical science (Poppi 2009, pp. 112–115). In metaphysics, according to Malafossa, God can only qualify as the “principal” subject according to an order of perfection, but in no case, however, can he constitute its subject according to an order of adequation (Malafossa, 1553, f. 2v; Andersen 2009, p. 448).

Finally, among the Scotists active during the Renaissance, we must not forget Nicholas of Orvaux and Gabriele Zerbi. Concerning Nicholas of Orvaux (1400 ca.–1475 ca.), little biographical information is available today. He joined the Order of Friars Minor of the Observance and taught at the Universities of Paris, Poitiers, and Angers. Having acquired a deep knowledge of Duns Scotus’s thought, he committed himself to spreading his teaching among his contemporaries. His commentaries on the *Sentences* (*Super Sententias compendium perutile*) and *Metaphysics* (*Compendiosa et optima expositio duodecim librorum metaphysicae Aristotelis secundum viam Scoti*), reprinted several times between 1495 and 1520, can be interpreted as the result of this intense activity. The views supported by Nicholas of Orvaux are consistent with the teaching of Duns Scotus. Like Duns Scotus, Nicholas of Orvaux assigns a sharp “ontological” characterization to metaphysics. Following the view commonly attributed to Avicenna, he argues that being *qua* being is to be considered as the adequate subject of metaphysical science. God and separate substances are instead the principles and the causes of that subject, as widely admitted by an influential and consistent tradition. According to Nicholas of Orvaux, who partakes Duns Scotus’s opinion, the causal function assigned to God and separate substances does not imply that the subject of metaphysics does not subsume them. According to him, even if God and separate substances are principles and causes of categorial beings, they are to be considered, in any case, as parts of the subject of metaphysics, that is, as its *partes subiectivae* (Nicolaus de Orbellis 1485, ff. unnumbered).

Gabriele Zerbi (1445–1505) studied at the University of Padua and became a professor at the University of Bologna in the last quarter of the

fifteenth century. Although he was mainly interested in natural philosophy and medicine, Zerbi also dealt in-depth with metaphysics. His *Quaestiones metaphysicae*, printed for the first time in Bologna in 1482, are quite remarkable in this regard. Zerbi’s interpretation of metaphysics is deeply influenced by Duns Scotus’s thought. Like the Scottish theologian, Zerbi partakes the “ontological” model developed by Avicenna (which he welcomes, however, without denying the “theological” interpretation supported by Averroes). In his mind, the subject of metaphysics is being *qua* being (*ens inquantum ens*): the ontological nature of metaphysical investigation is beyond any doubt for him. Equally unquestionable, in his eyes, is also another thesis generally accepted within the Scotistic school: being *qua* being includes not only categorial entities but also God and separate substances (cf. Forlivesi 2008, pp. 257–263). In Zerbi’s *Quaestiones*, however, the nature of this inclusion is somewhat ambiguous. On the one hand, Zerbi underlines that the relationship between God and being *qua* being is to be understood in a causal sense: according to his interpretation, God is the principle or cause of the subject of metaphysics. On the other hand, Zerbi resolutely states that God constitutes a part of that subject. Probably, the ambiguity just detected is only verbal because Zerbi firmly reaffirms, on several occasions, the inclusion of God under the subject of metaphysics (Zerbi 1482, I, q. 2, ff. unnumbered). However, the fact remains that it is difficult, under Zerbi’s interpretation, to keep these two conflicting statements together. A partial justification for this attitude, which actually runs through the entire body of his *Quaestiones*, can be found in the fact that Zerbi’s commentary has a marked syncretistic characterization: while agreeing in general to the Scotist approach, Zerbi often tries to show the compatibility between the teaching of Duns Scotus and some fundamental assumptions of the Dominican tradition (with a particular reference to Albert the Great and Thomas Aquinas). In this attempt to reconcile divergent doctrines, however, the risk of confusing positions that are not entirely organic and consistent is always high: Zerbi often considers equivalent some

assumptions belonging to theoretical contexts that are profoundly different and in some ways incompatible.

Regarding the unity of metaphysical science, the supporters of Duns Scotus admit, with few exceptions, the univocity of being. In their opinion, the unity of metaphysics can only be guaranteed by conceding that the concept of being is univocal and that all its inferiors (including God) relate to its objective content according to an identical *ratio substantiae*.

In this general agreement that characterizes the Scotistic school can be identified, however, as a front of disagreement and discussion. While some Scotists assigned to the *communitas entis* an essentially logical nature (which involves only the sphere of predication), others attributed it with an authentic ontological value (such as to imply a *communitas* subsisting beyond mere mental representation). During the Renaissance, and until the middle of the seventeenth century, this involvement was one of the themes most addressed by the *formalistae* or *formalizantes*, supporters of a Scotism sensitive to the influence of Renaissance Platonism. Starting from the teaching of Antonio Trombetta, authors such as Giovanni Vallone and Francesco Pitigiani d'Arezzo (followed later by some influential Scotists of the seventeenth century) questioned the "reality" (*realitas*) of the *conceptus entis*, affirming the existence of a real commonness (*communitas realis*) as a ground for the legitimation of the univocal predication (Vallone 1588; Pitigiani 1606).

From a historical point of view, the coherence of the Scotist thought has helped to impose an interpretation of metaphysics as a transcendental science, that is, as a general science including finite and infinite beings, material and immaterial ones. This approach not only marked the Franciscan front, substantially faithful to the teaching of Duns Scotus, but also the Dominican one. The doctrines elaborated by the followers of Duns Scotus ended up deeply influencing even those authors who moved from different doctrinal frameworks. Even the supporters of alternative approaches were now arguing using the vocabulary and conceptuality that Duns Scotus and his

followers had developed and helped to spread. Accordingly, the lexicon elaborated within the Scotistic school became the new vocabulary of philosophy, with a particular reference to metaphysics, within a few years.

The Dominican Tradition

During the Renaissance, an alternative to Scotist thought was constituted by the positions of some Dominican authors principally influenced by Thomas Aquinas. Among these, Dominic of Flanders, Paolo Barbo Soncinas, Thomas de Vio Cajetan, and Giovanni Crisostomo Javelli are the most important and influential (cf. Ruffinengo 2009).

Dominic of Flanders (1425–1479) was a leading member of the Dominican Order during the Renaissance. He studied in Paris and Bologna under the guidance of John Versor and Peter of Bergamo. Afterward, he taught for a long time in Bologna, Florence, and Pisa. Dominic of Flanders is the author of a very important commentary on Aristotle's *Metaphysics* – *In duodecim libros Metaphysicae Aristotelis secundum expositionem eiusdem Angelici Doctoris* – first published in Venice in 1499 and then reprinted in Cologne in 1621 (Mahieu 1942; Marrone 2015 and 2016). In his commentary, the Dominican Friar deals extensively with the *quaestio de subiecto metaphysicae*, examining the different answers developed by his predecessors and contemporaries. The first opinion taken into account considers God and separate substances as the true subject of metaphysics. According to Dominic, however, this opinion is inadmissible since it entails a series of consequences that contradict the principles and the text of Aristotle's *Metaphysics* (Dominicus de Flandria 1621, pp. 7–9). The second opinion taken into account affirms indeed that the subject of metaphysics includes only substance insofar as it is substance. This opinion, however, presupposes as many contradictions: if one accepts it, one has to admit that many properties of being do not fall within the consideration of metaphysics. Like the first, this second opinion excessively narrows the scope of metaphysics (Dominicus de Flandria 1621, pp. 9–10).

Given these critical issues, all that remains is to assert that the subject of metaphysics is being *qua* being (*ens inquantum ens*). However, it is precisely by reference to this thesis, generally accepted during the Renaissance period that Dominic of Flanders distanced himself from his contemporaries. He denied that the being with which metaphysics deals is common to God and creatures. If one admits the thesis according to which science is nothing but an inquiry about the causes of its subject, one is obliged to affirm that the subject of metaphysics is not common to God and creatures. The self-evident reason for this impossibility is that God cannot have any cause. Moreover, according to Dominic of Flanders, if one assumes that being is common to God and creatures, there would be no argument to oppose the opinion that being as such can also include beings of reason. In his opinion, if one attributes a transcendental function to the concept of being, it becomes necessary to attribute to this concept the widest generality, consequently asserting the possibility that it also includes beings of reason (Dominicus de Flandria 1621, pp. 10–11).

Rising from these premises, the only admissible opinion is that the subject of metaphysics coincides with the categorial being, that is, the being as divided among the categories. Dominic of Flanders, accordingly, restricts the scope of metaphysics to finite beings only, thus expelling God from the domain of metaphysical science (Dominicus de Flandria 1621, pp. 11–14).

The thesis held by Dominic of Flanders qualifies as eccentric in the framework of Renaissance metaphysics. His position indeed remained a minority one. Almost all authors, even among the Dominicans and the Jesuits, affirmed without hesitation that the subject of metaphysics is being insofar as it is common to God and creatures. It is perhaps for this reason that the Flemish Dominican admitted the possibility of considering, albeit improperly and in a broad sense, the transcendental being as the adequate subject of metaphysics.

After taking into consideration the possibility that substance is the subject of metaphysics, Dominic of Flanders evoked a distinction that he originally referred to Albert the Great and Thomas Aquinas. In his view, it is indeed possible to

distinguish, concerning metaphysics, the most common subject (*subiectum communissimum*), the common subject (*subiectum commune*), and the special subject (*subiectum speciale*, that is, *subiectum adequationis* or *attributionis*). The most common subject of metaphysics is the transcendental being, which indifferently includes God and creatures. The common subject – that is, the adequate subject (*subiectum adequationis*) or the subject of attribution (*subiectum attributionis*) – is indeed the being that is divided into the ten categories. Finally, the special subject of metaphysical science is substance as such (Dominicus de Flandria 1621, p. 9).

However, this distinction is unable to make Dominic of Flanders' view equivocal. As already stated, he firmly believed that the proper subject of metaphysics (i.e., its *subiectum attributionis*) coincides with the categorial and finite being. The distinction that Dominic of Flanders formulates here seems therefore to have a threefold purpose: first, it represents an attempt to systematically organize the different accounts provided by his contemporaries for the question about the subject matter of metaphysics; second, it tries to reconcile the different claims that it was possible to find in the text itself of Aristotle's *Metaphysics*; and third, it aims to legitimize Dominic of Flanders' opinion about a doctrinal framework which is at least ambiguous.

Moreover, the absence of a common interpretative framework is something evident within the Dominican Order. Domenic of Flanders' solution was soon denied, for example, by his brethren, Paolo Barbo and Giovanni Crisostomo Javelli. Paolo Barbo Soncinas (1458 ca. – 1495) entered the Order of Preachers (Dominicans) in 1472 and studied at the Dominican studium in Bologna. After 1485 he began his teaching career, which took him first to Milan and then back to Bologna (cf. Jindráček 2008, *passim* and in part. pp. 80–87). Among the writings of Paolo Barbo, central are undoubtedly his *Acutissime quaestiones metaphysicales*, published posthumously in Venice in 1498 (and then reprinted several times between 1505 and 1622). Concerning the determination of the subject matter of metaphysics, Paolo Barbo partakes the “ontological” interpretation developed

by Avicenna. In his view, metaphysical science is concerned with being as such, that is, being insofar as it includes God and creatures (cf. Jindráček 2008 and 2017; see also Ruffinengo 2009, pp. 150–153). Starting from the same principles and authorities taken into account by Dominic of Flanders, he reached the opposite conclusion. In his view, the proper subject matter of metaphysics is being as such, that is, being insofar as it includes not only categorial beings but also God and separate substances (Paulus de Soncino 1588, p. 16b). According to Paolo Barbo, metaphysics is concerned with the divine being as a part of its subject matter. Consequently, it considers God not only as a principle or a cause but also by reference to its partially knowable nature. In this same perspective, after all, Paolo Barbo interpreted some of Thomas Aquinas' main arguments. In his eyes, while always affirming the exceptionality of the divine being, Thomas Aquinas did not bring arguments that could justify the exclusion of God from the subject of metaphysics (Paulus de Soncino 1588, p. 17a).

From a strictly metaphysical perspective – which Paolo Barbo made his own – the divine being shares the most relevant characteristics of being as such, and it is for this reason that it can undoubtedly fall under its concept. The fact that the metaphysician can also qualify God as the principle or cause of the subject matter of metaphysical science does not exclude that metaphysics considers God as an inferior to the concept of being. A crucial consequence of this approach is that the transcendental nature of metaphysics neutralizes all causal links by reconnecting the diversity of its objects to the unity of the subject matter of metaphysical science. The analogical relationship existing between the divine being and the categorial being, understood in terms of causality and attribution, is placed within a unitary subject, which extrinsically guarantees the unity of metaphysical science. In this way, Paolo Barbo asserted without contradiction two seemingly conflicting theses: on the one hand, he affirmed the unity of metaphysics by grounding it on the unity of its subject matter; on the other hand, he interpreted this essential unity as analogical.

Duns Scotus's thought greatly influenced the theological and metaphysical debate. Moreover, the vocabulary and conceptuality that he developed quickly spread not only among his students and followers but also within the Dominican Order. Even more than in Paolo Barbo, in fact, Duns Scotus's influence is manifest in Giovanni Crisostomo Javelli (ca. 1470–ca. 1538). Having joined the Order of Preachers (Dominicans) in 1485, Javelli studied philosophy and theology in Bologna. After completing his theological and philosophical studies, he started an important career as a master. He began teaching in Bologna, Milan, Piacenza, and Cremona in 1507. Concerning metaphysics (cf. D'Ettore 2015), Javelli is the author of two important writings: the *Epitome in libros Metaphysicae Aristotelis*, published for the first time in 1531, and the *Quaestiones super duodecim Metaphysices Aristotelis libros ad mentem Aristotelis et sancti Thomae*, printed for the first time in 1534. In his *Quaestiones*, Javelli discusses the subject of metaphysics in the opening of the *Prologue*. Before declaring his view, the Dominican theologian evokes the most popular opinions between the end of the fifteenth and the beginning of the sixteenth century. In this regard, Javelli distinguishes three main positions. According to the first of these positions, commonly attributed to Averroes, God and separate substances constitute the subject matter of metaphysics. While rejecting this position, however, Javelli points out that it does not coincide perfectly with what Averroes asserts in his commentaries. If it is true that the Commentator seems at times to legitimize a theological interpretation of Aristotle's *Metaphysics*, it is undeniable that he often states that the object that ontology deals with is being *qua* being, and not, precisely, its causes or principles (Javelli 1555b, p. 2rv). Javelli then evokes Dominic of Flanders' opinion, according to which categorial or finite being is the subject matter of metaphysics. Javelli rejects this view by systematically responding to all the reasons provided by Dominic of Flanders (Javelli 1555b, pp. 2v–3r). Finally, after rejecting these arguments, he presents his position. In his opinion, the subject matter of metaphysics is “real being” insofar as it includes

God and creatures, the finite and the infinite, created and uncreated entities (cf. Ruffinengo 2009, pp. 160–164). Taking up this thesis, Javelli believes he is part of an interpretative tradition that incorporates authorities such as Averroes, Avicenna, Algazel, Albert the Great, Thomas Aquinas, and John Duns Scotus. In his mind, neither categorial being (which is divided by the ten categories) nor supertranscendental being (which also includes beings of reason) could constitute the subject matter of metaphysics. Unlike real being, indeed, a being of reason does not entail any unity which can allow it to be the true subject of a real science (Javelli 1555b, p. 3r sqq.).

The Jesuit Tradition

During the Renaissance, a significant part of the reflection on metaphysical issues was due to the contribution of some major Jesuit philosophers and theologians such as Benito Pereira, Pedro Fonseca, and Francisco Suárez. Each one in his way and with different levels of depth directed the history of metaphysics toward the ontological science that philosophers could acknowledge in seventeenth-century textbooks.

Born near Valencia, Benito Pereira (1535–1610) joined the Society of Jesus in 1552. After completing his first degree in Spain, he moved to Rome, where he achieved his studies and then taught grammar, rhetoric, theology, logic, and metaphysics (cf. Blum 2006). The work in which Pereira is particularly concerned with metaphysical issues is his *De communibus omnium rerum naturalium principiis et affectionibus*, published for the first time in Rome in 1576 and then reprinted several times between 1579 and 1618 (Lamanna 2009, pp. 326–340).

In his *De communibus*, Pereira relates the question of the subject of metaphysics to the traditional enumeration of speculative sciences developed by Aristotle. Within the framework of this discussion, Pereira asserts that any science must deal with the principles, the properties, and, finally, the species of its subject. Starting from this general indication, the Spanish Jesuit affirms that the subject matter of metaphysics is being *qua* being, and distinguishes three parts in it: a first part that deals with the highest and noblest beings (God

and separate substances); a second part that deals with transcendental notions (one, true, good, act, and potency); and, finally, a last part that investigates the categories and the beings that belong to the categorial domain (Pereira 1576, pp. 13–14). In this complex framework, metaphysics is understood as a universal science in which converge, albeit diversely, beings that are different in nature and dignity. This does not mean, however, that metaphysics is not a unitary science. In any case, indeed, its unity is guaranteed by the fact that the inferiors of being refer to substance according to the traditional model of analogical attribution (*attributio ad unum*). In his *De communibus*, however, Pereira returns a second time to the question of the subject and the status of metaphysics, proposing a new explanatory model. This new version of his position presupposes three distinct but related statements. First statement – There is a science of being that deals with transcendentals, categories, and all parts of being. According to Pereira, this statement is unquestionable: if any of the particular sciences were to deal with being as metaphysics does, it would go beyond the limits imposed by its subject. It is necessary, therefore, to affirm the existence of a universal science of being entirely distinct from particular sciences. Second statement – This universal science should not deal with separate substances *per se*, understood as parts of being, but only, perhaps, insofar as they constitute the general principles and the universal causes of all beings. If the universal science were to deal with the species of being considered as such (*absolute*), it would cease to be a universal science and would fall into the fragmentary domain of particular sciences. Third statement – Starting from the previous assertions, it is necessary, according to Pereira, to postulate the existence of two distinct sciences: a first philosophy (*prima philosophia*) dealing with the transcendental notions and the most universal things (and perhaps with separate substances understood as causes or principles); and a metaphysical or theological science (*metaphysica/theologia*), which on the contrary deals with separate beings understood as the true subjects of the first science (Pereira 1576, pp. 14–16).

Although it is not without ambiguities and uncertainties, the idea that arises from Pereira's *De communibus* is quite clear. Metaphysics can preserve its unity only if it divides into two distinct sciences: a general science of being, which Pereira names *prima philosophia*, and a science of separate beings, whose name is instead metaphysics, theology, or divine science. After Pereira, as it is here evident, the structure of modern ontology is definitively well outlined.

In the same years in which Pereira wrote his masterpiece, another Jesuit, Pedro Fonseca, worked on what is perhaps the first attempt at systematic elaboration of Aristotle's *Metaphysics*. Having joined the Society of Jesus in 1548, Pedro Fonseca (1528–1599) studied at the University of Evora, where he later started his career as a teacher. His teaching then continued at the University of Coimbra (1555–1561), where he actively participated in the elaboration and drafting of the *Cursus conimbricensis*. Among Fonseca's most famous writings, there is also an impressive commentary on *Metaphysics* – *In libros Metaphysicorum Aristotelis Stagiritae* –, published in four volumes between 1577 and 1612 (Fonseca 1577, 1589, 1604, 1612). Fonseca's commentary arises from an idea that was spreading in his day. Its purpose, in this regard, was primarily to quit the traditional form of commentary and to develop a systematic exposition of metaphysical issues. After providing the reader with the Greek text, the Latin translation, and a first literal explanation, Fonseca re-elaborates Aristotle's metaphysical teaching into self-sufficient questions. This original approach has an obvious consequence: the reader has no longer a simple explication of the texts, but a complex interpretative model that allows the reader to place Aristotle's teaching in the framework of a living debate (cf. Martins 2019).

Concerning the contents, Fonseca does not distance himself from the thesis commonly accepted by his predecessors and contemporaries. He states in fact that the subject matter of metaphysics is *ens inquantum ens*, that is, being insofar as it includes not only categorical entities and creatures but also God and separate substances (cf.

Martins 1982). Adopting this interpretation, Fonseca intentionally placed himself within a consistent tradition: authors such as Averroes, Albert the Great, Thomas Aquinas, Giles of Rome, John Duns Scotus, and Paolo Barbo had indeed already developed the interpretation that he now supported (Fonseca 1577, pp. 497–498). Fonseca, however, not only roots his thesis in the opinions of his predecessors and contemporaries but also provides precise reasons and grounds to demonstrate its legitimacy. Fonseca's argumentation is a response to a classic objection. According to this objection, God cannot be a part of the subject of metaphysics for two essential reasons: first, because he shares nothing real with creatures; and, second, because he cannot be known *naturaliter lumine*. In Fonseca's view, these arguments are not able to exclude, as they would claim to do, the inclusion of God and separate substances in the domain of being *qua* being. According to the Portuguese Jesuit, God and some creatures share a series of passions and general properties (*unum, bonum, verum*) that can be demonstrated by resorting to the natural light of human reason. However limited, natural knowledge of God is, therefore, possible: nothing prevents the metaphysician from considering God, like creatures and with creatures, *sub ratione entis*. In Fonseca's reading, hence, metaphysics does not limit itself to considering God as a simple cause or a principle of being, but as a true part of its proper subject. Accordingly, metaphysics can consider God *absolute*, that is, separately and regardless of any causal link. If this were not the case, metaphysics would not differ from natural and moral philosophy, which instead respectively consider God as the first mover and the ultimate goal of action (Fonseca 1577, pp. 498–499). This does not mean, of course, that God does not exercise a causal function, but only that he exercises it without placing himself beyond being. Within the subject of metaphysics (*ens inquantum ens*), therefore, there is space for all the causal and analogical relationships that constitute the texture of being.

The same tendency to systematicity that characterizes Fonseca's approach appears again, in an

even more radical form, in the thought of Francisco Suárez (1548–1617). Like Fonseca, Suárez definitively abandoned the form of commentary to attempt a reorganization of metaphysical issues under the framework of a systematic elaboration. After entering the Society of Jesus in 1564, Suárez studied philosophy and theology in Salamanca between 1566 and 1570. During his teaching in Rome, Alcalà, and Salamanca, Suárez dealt with law, philosophy, theology, and metaphysics. In 1597 he published his *Disputationes metaphysicae*, an authentic masterpiece that deeply influenced the modern interpretation of metaphysics as ontology. In the history of the reception of Aristotle's *Metaphysics*, Suárez represents a true point of no return. Even behind the contents, he renewed the method of metaphysics and developed an interpretative model that spread widely during the Modern Age. The Spanish Jesuit, therefore, proposes a systematic approach to metaphysics: to do this, he definitively abandons the form of commentary and reorganizes the entire conceptual matter covered by metaphysics. Suárez aimed to replace the multitude of commentaries on *Metaphysics* with a new synthesis that would provide the reader with a complete exposition of Aristotle's teaching and, at the same time, a detailed discussion of the most authoritative interpretations. Suárez then elaborates a real modern textbook, sufficient in itself to provide the reader (mainly the students of the colleges) with all the information necessary to achieve complete training in the field of metaphysics. Suárez's contribution, on the other hand, is not only concerned with the method, the form, and the style of exposition. The renewal process that he inaugurated also concerned the contents of metaphysical science. In the opening of his *Disputationes metaphysicae*, following a well-established tradition, Suárez ponders the subject of metaphysics. In the treatment of this fundamental issue, he proceeds as Fonseca did: he takes into account the most accredited opinions and, after discussion, he finally proposes his own solution. The Suarezian synthesis, however, is far-reaching both from a quantitative and a methodological point of view. From a quantitative point of view, Suárez

considers a large number of opinions with a mastery that was absent in Fonseca's commentary. From a methodological point of view, however, the reference to the opinions held by his antecedents and contemporaries has not a simple doxographic function: Suárez takes into account views supported by other commentators to show the reader in advance the legitimacy of the thesis that he will formulate in the end. In his inquiry about the *quaestio de subiecto metaphysicae*, Suárez discards the opinions that excessively widen or restrict the subject of metaphysics. Consequently, he refutes both the view that includes beings of reason and beings per accidens within the domain of real being, and the one which narrows the subject of metaphysics to God, to separate substances alone, to substance *tout court* or, finally, to categorial being (Suárez 1597, pp. 2–8; Suárez 1861, pp. 2–11). Suárez opposes these views with a thesis already widespread in his time, but he deeply renews it by clarifying the nature of the being with which metaphysics deals. According to the Jesuit theologian, the subject of metaphysics is being as “real being” (*ens inquantum ens reale*). This statement, according to the Spanish Jesuit, is generally accepted by philosophers and theologians such as Aristotle, Alexander of Aphrodisias, Avicenna, Averroes, Alexander of Hales, Giles of Rome, John Duns Scotus, and Paolo Barbo Soncinas. Understood as a real being, the subject of metaphysics includes not only categorial or finite being but also God, separate substances, and real accidents (Suárez 1597, pp. 8–9; Suárez 1861, pp. 11–12). According to Suárez, consequently, metaphysics deals with the totality of being. It can do it, however, since the totality of being can constitute the proper object of a conceptual determination (*conceptus obiectivus entis*). The immediate object of metaphysical knowledge is, therefore, the concept that represents the *ratio entis* by abstracting it from the individual instances in which it subsists. In this sense, particular essences (material and immaterial ones) are undoubtedly included in the consideration of metaphysics, but metaphysics, for its part, understands them only by reference to the real being in which they agree

(cf. Darge 2014, *passim* and in part. pp. 98–100; Forlivesi 2006, *passim* and in part. pp. 576–584; on the unity of metaphysical science, cf. Heider 2009). In this view, the objective concept of being (*conceptus obiectivus entis*) is simply the principle by which the intellect conceives individual beings and essences as parts of a unified subject (Suárez 1597, pp. 48, 53–54; Suárez 1861, pp. 64–65 and 72–74). The *conceptus entis*, moreover, does not imply a generic identity, which is both real and numerical, but rather a formal and fundamental one. Particular beings, indeed, do not include a common entity in which they agree as in a *genus* or a *species*. What they imply is only a grounding principle, that is, an indeterminate *aliquid* by which they can share the same *ratio entis* (Suárez 1597, p. 55; Suárez 1861, p. 75).

In Suárez's *Disputationes metaphysicae*, the interpretation of the *realitas entis* in terms of possibility is then evident. According to Suárez, indeed, real being does not designate either the being-in-act or the being-in-potency, but that kind of (possible) being which is capable of receiving existence. From this doctrinal perspective, the "reality" of being consists precisely in this *aptitudo ad existendum*, which constitutes its primary sense. In Suárez's view, accordingly, real being is nothing but the possible. At the same time, however, it is self-evident that the possible itself should not be understood as the simple object of divine power, but rather as a particular item to which existence is not repugnant (Suárez 1597, p. 65; Suárez 1861, pp. 89–90). "Reality" is said of all real beings because of a possibility that belongs to them, notwithstanding the creative power of God. In other words, the possibility/reality of being coincides with the absence of contradiction (*non-repugnantia*) and with the true capacity to receive existential being as an accident (*aptitudo ad existendum*). On the one hand, therefore, ontology has here to do mainly with the possibility/reality of the possibles, which includes the existential being as a quasi-species. On the other hand, possibility is understood in such a way as to link the creative operation of God to the logical possibility of beings (Suárez 1597, pp. 64–67; Suárez 1861, pp. 89–91).

Now, it is more than self-evident that the advent of Suárez's thought introduced significant novelties within the history of metaphysics. The subordination of the *quaestio de subiecto metaphysicae* to the doctrine of *conceptus obiectivus*, the interpretation of being as a possible reality, and, finally, the understanding of reality in terms of possibility significantly widened the domain commonly assigned to metaphysics. From 1597, the year of publication of Suárez's *Disputationes metaphysicae*, almost no one substantially questioned the theoretical characterization that he imposed on metaphysics. Many were those who criticized Suárez on some points of detail, but no one dared to deprive metaphysics of the transcendental perspective that the Jesuit theologian himself impressed on it. The history of metaphysics in the Modern Age moves from Suárez's thought as well as from its main authority. Suárez introduces metaphysics into a conceptual-historical dimension in which it is no longer a question of interpreting Aristotle's teaching more or less faithfully, but of elaborating from the beginning a new science of being – a science to which modern authors will attribute, as is well known, the name of ontology.

Meteorology in Renaissance Science

Abstract

Meteorology was a central part of natural philosophy during the Renaissance. It largely followed an Aristotelian framework as established in medieval universities. During the Renaissance, in universities and beyond, scholars wrote hundreds of works based on Aristotle's *Meteorology* in both Latin and the vernacular. Inquiry was primarily causal in character, rather than predictive, although a few scholars sought to develop systemic observations that they hoped would lead to better forecasting. The field was based on the idea that meteorological phenomena were imperfect mixtures that resulted from the combinations, transformations, and motions of two exhalations that flowed through the air in the sublunary region and beneath the earth. Scholars gave much attention to explaining rare and extraordinary events, which some considered to be prodigies or signs of God's will. Many natural philosophers held that a number of their theories were provisional and probable, leading them to revise existing theories that did not conform to observed events. Changes in the field resulted from a broadening of ancient sources, new experiences, and experiments – including European voyages of discovery, Lutheran emphases on providence, and the growth of mineralogy and alchemy. There was great continuity between meteorology of the Renaissance and of the seventeenth century, although the emergence of heliocentric cosmology, new conceptions of air and void, and refinements in chemical theories led to general distancing from the Aristotelianism of the Renaissance.

Introduction

During the Renaissance, meteorology was considered a philosophical field, forming part of natural philosophy. Consequently, meteorology was part of the arts curriculum in most Renaissance universities. Just as for many of the philosophical subjects taught at universities, courses on meteorology followed Aristotle's writings on the topic; and Aristotelian concepts formed its theoretical foundations.

As such, Renaissance meteorology does not neatly match modern definitions of the field. Most prominently, during the Renaissance, the topic was almost exclusively concerned with giving causal accounts, eschewing, for the most part, predictions and forecasting, which were mostly part of astrology (Jenks 1983). These causal accounts followed the Aristotelian understanding of four causes (material, efficient, formal, final) and emphasized the first two, namely, material and efficient causes. The emphasis on these two causes derived from the definition of most meteorological phenomena as being imperfect mixtures, meaning that they are composed of the four elements (earth, water, air, fire) but have not been sufficiently transformed into a new substance that possesses its own essence or substantial form. Consequently, meteorological phenomena, in contrast to living beings and their parts, were seen as imperfect and not in possession of their own intrinsic purposes, limiting final causes to being anthropomorphic, providential, or cosmic in nature. While Aristotle's *Meteorology* did not in fact discuss the final causes of meteorological phenomena (Wilson 2013, 102–4), some Renaissance commentators proposed their own. Nevertheless, discussions of purpose and ends were fewer and far briefer than considerations of the material and efficient causes of meteorological phenomena, especially in writings produced in Italian universities.

Another important way that the definition of Renaissance meteorology differs from modern conceptions of meteorology stems from its link to Aristotelian conceptions of the earth's place in the cosmos. According to Aristotelian cosmology, the earth rests in the center of the universe, with the stars and planets rotating in their orbs in

circular, infinite paths. The heavenly bodies, including the sun and moon, composed of ether or quintessence, are distinct from the bodies made up of the four elements that occupy the area below the moon. Unlike the perfect, static celestial matter, the sublunary elements constantly change and transform into each other. Premodern meteorology examined these sublunary elemental transformations. Thus, meteorology equated itself with the transient, episodic, and relatively disorderly sublunary world, while astronomy and cosmology were occupied with the more regular movements of stars and planets. Accordingly, many topics of Renaissance meteorology are not considered to be part of meteorology today. These include transformations of the elements beneath the earth, which produce earthquakes, hot springs, rivers, and even the formation of metals and stones.

The general explanatory schema for most meteorological phenomena depended on the interactions and motions of two exhalations, one vaporous, predominately water, and the other hot and smoky. The power of these exhalations corresponds to the elements that compose them. Vapor, when heated by the sun, breaks into smaller parts and rises. After the wet exhalation has reached a significant height, the cold air turns the misty vapor into a liquid and it falls, forming hail, snow, or rain, depending on the coldness of the surrounding air. Aristotle did not consider vapor to be of a single kind of species. Similarly, the dry exhalation, which was linked to smoke, fire, and wind, had a variety of subspecies. In general, the dry exhalation, fiery in nature, rises to the upper levels of air, where it at times bursts into flames, causing shooting stars, comets, and other fires in the sky. Most Renaissance natural philosophers understood that the motions of the dual exhalations resulted in an aerial region, lying between the surface of the earth and the moon's sphere, which was divided into three parts. The lower part, near the earth's surface, contained warm air, heated by the reflections of celestial heat from the earth; the middle region, where clouds typically reside, was cold, while the highest region, near the moon's sphere, was hot, because of its proximity to the moving sun and the presence of the hot, dry exhalations that tend toward that region.

Another important distinction between pre-modern and modern meteorology is that some phenomena now considered to take place beyond the moon were considered to be sublunary and therefore meteorological. The most prominent examples are comets, which were largely held to be sublunary, conforming with their seemingly irregular periodicity. Aristotle also held that the Milky Way was also sublunary, although this idea was rejected already in antiquity as well as during the Middle Ages, by eminent Aristotelian scholars including John Philoponus (c. 490–570) and Albertus Magnus (c. 1200–1280). Meteors, shooting stars, and similar phenomena, believed to be the result of fires burning in the upper region of the air, close to the sphere of the moon, also held important places in Renaissance meteorology.

Finally, following Aristotle, Renaissance works on meteorology distinguished between optical meteorological phenomena and those composed of imperfect mixtures. The latter were actual bodies and resulted in phenomena that include weather events, such as rain, hail, snow, and rare fires and lights in the sky, like comets and meteors. In contrast, the former were not bodies per se but were the product of light's interaction with meteorological conditions, such as fog or mist. The most commonly discussed example of optical meteorology is the rainbow; other examples include haloes around the sun and moon and the appearance of double suns. Because optics was a discipline that mixed mathematical and physical accounts, Aristotle gave a mathematical explanation of rainbows as did many Renaissance scholars (Boyer 1959).

Medieval Heritage

Like other parts of natural philosophy, meteorology during the Renaissance shared great continuity with the medieval scholastic tradition. Numerous professors at medieval universities lectured on Aristotle's *Meteorology*, and their commentaries and quaestiones are preserved in hundreds if not thousands of manuscripts. The subject was far from marginal to the intellectual activities of medieval universities. Many of

the most famed medieval scholars, including Albertus Magnus (c. 1200–1280), Thomas Aquinas (1225–1274), and Jean Buridan (1295–1353), wrote on meteorology. In some universities, such as Prague, the important annual ceremonial quodlibetal disputations included meteorological subjects (Kocánová 2017). Meteorological writings produced in Renaissance universities frequently maintained the forms of writing developed in the Middle Ages, such as commentaries that expounded on each passage of Aristotle's text and groups of *quaestiones* that investigated specific issues. Renaissance authors regularly cited their medieval predecessors. In particular works by Averroes (1126–1198), Albertus Magnus, and Peter of Auvergne (c. 1240–1304) were influential. Many concepts, such as perfect and imperfect mixtures and substantial forms, that originated in medieval scholastic discussions were crucial to Renaissance meteorological thought. Moreover, the Latin translation of Aristotle's *Meteorology* made by William of Moerbeke (c. 1215–1286) remained standard throughout the fifteenth and sixteenth centuries, despite the proliferation of a number of new Renaissance translations.

Continuity between medieval and Renaissance meteorological writings in universities is extremely evident, as are links between medieval and Renaissance writings in vernacular languages. Mahieu Le Vilain translated Aristotle's *Meteorology* into French in the 1270s, an early example of the vernacularization of natural philosophical knowledge (Ducos 1998). In the fourteenth century, an anonymous translation of passages from Albertus Magnus and Thomas Aquinas appeared in the Florentine dialect (Librandi 1995). Similarly, in the sixteenth century, there were numerous vernacular meteorological writings, especially in Italian, based on Aristotle's writings (Martin 2011, 60–79; Verardi 2012; Dal Prete 2014; Ray 2015, 77–88, 104–6; Dal Prete 2016; Gilson 2016). The widespread translation and composition of meteorological writings in vernacular languages reflect the belief in the utility of the subject for agriculture and for traveling merchants (Refini 2013) in addition to the broad attractiveness of explanations of many

marvelous natural phenomena and its relevance to natural disasters.

Innovative and Original Aspects

Like so many areas of Renaissance culture, discussions of meteorology distinguished themselves from the medieval tradition by their attempts to recover and replicate the ancient world. For meteorology, as for many fields influenced by humanism, this attempt entailed the recognition of a greater number of ancient writings as well as a deeper engagement with them. The recovery and translation of ancient commentaries on Aristotle by Alexander of Aphrodisias (c. 2nd and third century AD), Olympiodorus (c. 500–570), and Philoponus affected the content of university lectures and commentaries during the sixteenth century. Some Renaissance commentators, such as Agostino Nifo (c. 1470–1538), prized the ancient commentators because their temporal proximity to Aristotle conferred authority and their discussions in ancient Greek clarified Aristotle’s actual words. As a result, Nifo’s commentary on the *Meteorology* cites Alexander of Aphrodisias and the meaning of Greek words after nearly every passage. Indeed, a number of the most important Renaissance commentators on the *Meteorology*, including Francesco Vimercato (1512–1571) and Giacomo Zabarella (1533–1589), were more than capable philologists, who used their reading, or in the case of Vimercato his own translation, of Aristotle in the original language to inform their views. Alternatively, the famed and controversial professor at Padua and Bologna, Pietro Pomponazzi (1462–1525), seemingly remained content with his interpretations that did not incorporate these newly gained linguistic skills.

Beyond Aristotle’s writings, a range of ancient texts became more prominent sources of authority during the sixteenth century. In the 1530s and 1540s, Jakob Ziegler (c. 1470–1549) and Jakob Millich (1501–1559) wrote commentaries on the second book of Pliny’s *Natural History* in an attempt to find a replacement for Aristotle. Seneca’s *Natural Questions* offered Pomponazzi

material for thinking about final causes and the moral significance of natural disasters (Martin 2011, 45–47). For some, Stoicism bolstered the view that weather is providential in nature. Vimercato quoted long passages Lucretius’s *De rerum natura* about earthquakes and thunder in his commentary on the *Meteorology*. Even if he did not accept Epicurean atomism, Lucretius’s literary and cultural importance was relevant to expounding Aristotle (Vimercato 1556, 248–249, 273–281). Later, in baroque humanist fashion, Giambattista della Porta (c. 1535–1615) peppered his *De aeris transmutationibus* (*On the transmutations of the air*) with citations and discussions of vast number of ancient authors, finding the writings of Homer, Cicero, Aratus, Virgil, Theophrastus, Plutarch, Pliny, Hesiod, among others necessary for his exposition on the nature of air and its transformations (Della Porta 1617).

Beyond the innovations in textual investigations of meteorology, an important practice for Renaissance natural philosophy, a number of scholars presented new conceptual understandings of meteorology, which at times deviated from Aristotle’s texts or the medieval interpretative tradition. Since Aristotle scarcely mentioned teleology in the *Meteorology*, few medieval works engaged deeply with the topic. Taking up the subject, Pietro Pomponazzi expressed doubt that final causes could be discovered by the human intellect if they indeed exist (Martin 2010). After the Lutheran Reformation, however, scholars, particularly Lutherans based in German lands, such as Caspar Peucer (1525–1602), Markus Frytsche, Johannes Garcaeus (1530–1574), Wolfgang Meurer (1513–1585), and Michel Stanhuf (d. 1608), exhaustively catalogued the presumed final causes of meteorology, understanding the field as a “science of signs,” by which God’s will could be interpreted (Vermij 2010). The introduction of final causes in this manner reflected the reforms that Philip Melancthon (1497–1560) wished to introduce to natural philosophy. In particular, he held that such studies should focus on the providential character of nature. Accordingly, these Lutheran natural philosophers held that through meteorology, students could discover the world’s harmony. This

harmony entailed God's indicating future events through rare meteorological events that were considered prodigies that connect the human with the divine. According to this view, God sends earthquakes and lightning to punish and frighten sinners, while the rainbow announces God's pleasure and goodwill toward his creation. Moreover, cataloguing the historical record, as Frytsche and Garcaeus did, for example, was thought to demonstrate the relation between the appearance of comets and subsequent plagues, droughts, and political revolutions (Martin 2011, 51–59).

While Lutheran philosophers emphasized providence and teleology, other inquiries sought to revise understandings of the material and efficient causes. Many Aristotelian natural philosophers held that understandings of meteorology were not complete. The episodic, imperfect, and often distant character of many meteorological phenomena rendered human accounts of them provisional and probable (in the rhetorical sense). Agostino Nifo, for example, argued that meteorological theories should “save the appearances” a term that also astronomers used to describe their limited theories. Precise, certain, and complete knowledge, therefore, was considered elusive. Accordingly, Aristotle's views should not be taken as the final word on the subject. Pomponazzi argued that in many passages, he put forth only rhetorical arguments that lack the certainty of syllogistic demonstration (Martin 2009).

The indeterminate epistemological status of Aristotelian meteorology meant that many of the theories were open to revision, prompting a number of sixteenth-century natural philosophers to use experience and experiments as means to modify existing theories. Experiential considerations of meteorology were widespread during the early modern period. Renaissance natural philosophers considered experience to be a broad term that encompassed others' experiences taken from books, firsthand experiences, contrived testing and assaying, and regular observation. All such categories of experience applied to meteorology. The French intellectual Jean Bodin (1529–1496) is a superb example of a practitioner of bookish methods of experience. His *Universae naturae*

theatrum performed the functions of a commonplace book, collecting the theories and experiences of both ancient authorities, whether sacred or profane, and accounts found in more recent works of history (Blair 1992).

The Holy Roman Empire witnessed the growth, if not the beginning, of systematic record-keeping of meteorological observations that were used for ephemerides (Pfister et al. 1999). In Italy, Giovanni Pico della Mirandola (1463–1494) reported tracking the weather for 130 days, learning that its changes did not seem to correspond to what astrologers supposedly taught they should be (Pico della Mirandola 1557, 446–447). Consequently, he advocated using the natural, non-celestial forms of divination of the weather possessed by farmers, sailors, and physicians in order to develop empirical knowledge that could lead to accurate forecasting (Mandosio 2013).

In keeping with Aristotelian theories of knowledge that promoted the role of experience in the formation of knowledge, Renaissance natural philosophers used personal experiences to revise Aristotelian accounts of meteorology, even principles that were fundamental to the field. Giacomo Zabarella, a professor at Padova, recounted his experience on a mountain outside of the city on a day when it rained on the plains below but not on the mountain top. This experience led him to conclude that the clouds were lower than the peak and to doubt whether the Aristotelian conception of the middle, nebulous region of air was in fact true (Schmitt 1969). Simone Porzio (1487–1554), who taught at Pisa, used his knowledge of the soil of the Neapolitan region and borrowed from the emerging field of mineralogy to theorize that the bituminous character of the earth was at times ignited by the hot and dry subterranean exhalation. Such a conflagration in turn was responsible for a massive eruption in the *Campi Flegrei* in 1538 (Cocco 2012, 50–51; Martin 2011, 93–95). Similarly, after Ferrara was jolted by earthquakes from 1570 to 1571, Lucio Maggio, a gentleman courtier, observed that the terrain of Ferrara, which he concluded was exceptionally porous, and recent hot and dry weather combined to make the Po Valley susceptible to tremors created by dry winds coursing through

veins underneath the earth. Thus, he concluded that the recent cataclysm conformed to the dictates of natural philosophy, even if at first appearance it did not fit with Aristotle's descriptions of earthquakes occurring close to rough seas and simultaneously with eclipses and the appearance of thin clouds (Martin 2011, 60–79).

The observations and experiences of European travelers to the Americans and beyond prompted revisions to Aristotelian and other classical theories about meteorology and climate. Aristotle had hypothesized that a band of land around the equator, called the torrid zone, was too hot for human habitation, just as the areas near the poles were too cold. Applying this theory, Augustine maintained that there were no people who lived in the southern hemisphere, because the descendants of Adam and Eve would not have been able to travel there by passing through the scalding heat of this equatorial torrid zone. As European voyages of exploration frequently encountered highly populous regions in what had been considered uninhabitable, natural philosophers quickly rejected the concept, replacing it with more nuanced understandings of climate based on a multitude of factors, including winds and terrain, rather than simply latitude (Martin 2006; White 2015). Encounters with oceanic trade winds, not described by ancient sources, offered another avenue for innovation. Josè de Acosta (1539–1600), a Jesuit who traveled to the Americans, devised a new theory for the prevailing winds of the Atlantic, by which they were created by the pulling motions of the celestial bodies coupled with the expansion of vapors in the tropics caused by the excessive heat found there (White 2015, 552–553).

While the dual exhalations enjoyed an extremely long life, natural philosophers debated what they were composed of, importing Paracelsian ideas and alchemical theories to explain the explosiveness of both aerial and subterranean phenomena. Investigations into balneology, by Michele Savonarola (c. 1384–1462), and into mineralogy more generally by Georg Agricola (1494–1555) and Vannoccio Biringuccio (c. 1480–1539) help spread the idea that sulfur, salniter, and bitumen were the material causes of

fiery meteorological phenomena. Moreover, the effects of gun powder, harquebuses, canons, pyrotechnics, and siege mines became artificial analogies for lightning and earthquakes. Giambattista della Porta argued that there was a bituminous region of the air close to the moon, and thunder is created by volatile fuel closed up in clouds igniting, in an identical manner to artificially created explosions in cannons. Thus, new experiences and trials with the artificial altered perceptions of the natural (Martin 2011, 88–98). Della Porta also described experiments that he conducted with an inverted glass that contained water and when he heated allowed the expansion of the water to be visualized. These experiments followed upon the explanation of the Venetian mathematician Giovanni Battista Benedetti (1530–1590) that wind derived from the periodic rarefaction and condensation of air, caused by the sun's heat. Considerations such as these, although not offering a complete alternative to the Aristotelian framework, nonetheless influenced seventeenth-century figures, such as Cornelis Drebbel, a Dutch projector and courtier, who built a weatherglass that he thought replicated the transformations and interactions of air, water, and fire, demonstrating the links between microcosm and macrocosm (Borrelli 2008; Keller 2010)

Legacy and Influence

Seventeenth-century meteorology reveals strong continuities with its Renaissance predecessors in addition to stark differences. Perhaps most obvious is the emergence of chemical understandings of air that sought to investigate its composition and in particular the role of aerial niter particles in the formation of meteorological phenomena. Paracelsian alchemy grew in prominence during the first decades of the seventeenth century, and even scholars at universities, such as Daniel Sennert (1572–1637), a professor of medicine at Wittenberg, combined Aristotelian and alchemical corpuscularism in his explanations of meteorology. The Jesuit scholar Niccolò Cabeo (1586–1650) used an original reading of Aristotle's *Meteorology* as a basis for a chemical

and experimental philosophy that eschewed metaphysics. In the following generation, as alchemical ideas spread and transformed, John Mayow (1641–1679), a member of the Royal Society, was one of the greatest proponents of the presence of aerial niter. His views were sympathetically considered by other members of the Royal Society, who conducted experiments that attempted to identify the characteristics of these nitrous particles (Debus 1977, 492–499).

Renaissance approaches to meteorology resonated in other ways in the seventeenth century. *Les Météores* of René Descartes (1596–1650) mirrored the topics treated in the Coimbra commentary on Aristotle (Gilson 1951). Like his Aristotelian predecessors, Descartes employed the exhalations, and some of his accounts are directly parallel to Aristotle, such as his account of cycles of evaporation and rain (Wilson 2013, 162–163). Descartes hoped that his accounts would reduce the amount of stupefying wonder rare meteorological provoked. While Descartes naturalized the atmospheric prodigies that formed the subject of discussion in many sixteenth-century writings, these extraordinary events remained central to many scholars during the seventeenth century who reported, described, and explained exceptional and rare meteorological phenomena (Jankovic 2000).

The persistence of the employment of exhalations as the main cause of meteorological phenomena and of inquiries into the unusual and wondrous continued during the seventeenth century, despite the eventual rejection of the cosmology that underpinned Aristotelian meteorology. As heliocentric models displaced Ptolemaic cosmology, comets were no longer considered part of the subject. Moreover, the rejection of traditional cosmology and the idea of the immutability of the heavens allowed some, such as Johannes Kepler (1571–1630), to apply meteorological sciences to celestial matters (Boner 2006). Additionally, while exhalations and vapors remained part of meteorological theory, conceptions of the air deviated from traditional accounts, as the atmosphere was increasingly seen as composed of a mix of particles moving about in a void, and air pressure was increasingly used to explain variations in winds and weather.

Microcosm and Macrocosm in the Renaissance

Abstract

The idea of a microcosm-macrocosm correspondence is fundamental in the Renaissance interpretation of the world. To reach a better

understanding of Renaissance natural philosophy, but also astrology, medicine, and in general the strong relation between many different sciences, is important to know how microcosm, plants, minerals, and animals; and macrocosm, planets, and stars, are related. In medicine, in particular, the human body is considered a microcosm in its own right, and knowing the correspondence between its parts and macrocosm was a fundamental requirement for the healing process.

Introduction

The idea of a correspondence between the celestial world and the elements on Earth is really important in Renaissance philosophy. This kind of relation is traced between two ordered and complex systems, two *cosmoi*, one very big and one very small, a *Macrocosm* and a *Microcosm*, and between the similarities that can be found in them. Usually, Earth is considered a microcosm related to the rest of the universe, the macrocosm; but in many cases also man can be depicted as a microcosm in its own right, connected with the rest of the universe, including the Earth.

Heritage and Continuity with the Tradition

The Chaldean-Babylonians were probably the first to formulate this idea: the skies, the stars, and planets, their position and their movements are strictly connected to the movements and the life of everything on Earth. However, the most important connection for the Chaldeans was that between the movements of the stars and the planets and the human life; that's why they are conventionally known as the fathers of astrology.

Indeed, the idea behind astrology is a correspondence between macrocosm and microcosm: the life of the universe is mirrored in the life of the human being, an independent microcosm to all effects that gathers in itself the influences from stars and planets. Starting from this way of conceiving the universe, the study of celestial bodies' movements is the most relevant tool to reach a better understanding of the life and the destinies of

men. From the Chaldeans' age to the Middle age, during the whole Renaissance and much of the Modern age, astrology was acknowledged as one of the most important sciences and that's because of the idea of a precise correspondence between the life of the universe and the life of the microcosm human being (Titley 1937).

Another important science is rooted in the macrocosm/microcosm correspondence: alchemy. In the Emerald Tablet, attributed to the mythical founder of alchemy, Hermes Trismegistus, is written: "What is below resembles that which is above." "Below" is the sublunary world, saying it with Aristotelian words, and "above" is the celestial world. This is one of the fundamental teachings for the alchemist apprentice, because he had to understand the connections that go across the whole universe before being able to dominate its elements. Alchemy's origins are more various and composed than those of astrology: the technical and scientific notions enshrined by Egyptian priests for centuries have been enriched with elements from Greek and Hebrew culture. It is through the biblical book of *Genesis* that the idea of macrocosm-microcosm correspondence became acceptable and then important in the Christian Western culture: the universe is mirrored in terrestrial nature just like the image of God is mirrored in the human being and it is because of the development of God's project in the process of creation (Partington 1961).

Impact and Legacy

During the Renaissance, the idea of macrocosm-microcosm correspondence became even more important. Philosophy of Nature in the Renaissance is different from that inherited from Aristotle because a clear and unbridgeable distinction cannot always be found between the celestial and sublunar worlds. For a Renaissance philosopher, the key to the secrets of Nature and the dominion over it lies in the connections that bond together earth and sky, in the laws that regulate both. The ability to see the analogy between what is big and what is small is fundamental for the astrologer, for the alchemist, but also for the physician, and that is one of the reasons why, in the Renaissance, it was necessary to be a good philosopher to be an effective scientist, in every field of

science. To properly understand and profit from, say, the healing powers of a plant, the physician had to know which was the relationship of the plant to a certain planet or star, and also the relationship between the same planet or star and a part of the human body. The physician could only then connect properly the plant to the human body's part.

The invention of the telescope at the beginning of 1600 has been one of the most important scientific inventions of the Modern Age. It changed radically the relationship between the macrocosm and its observer and was fundamental to reaching a better and more detailed understanding of it. The same can be said for the later invention of the microscope. For the scholars of the Renaissance and the Modern Age, a more detailed knowledge of both the macrocosm and the microcosm was necessary to understand the entire world. The invention of the telescope and the microscope was a great help for this type of Nature researchers but also a consequence of their way of thinking (Turner 1985).

The medical philosophy of Theophrastus Paracelsus (1493–1541) is an important step in the development of modern medicine. One of the main ideas behind it is the correspondence between macrocosm and microcosm. Paracelsus conceived an idea of medicine, as opposed to iatrochemist Galenic medicine, considered a new type of alchemy with the aim of preparing medicines, and above all, a different way of thinking of man. Man is a copy of the macrocosm: in his body, each part of the entire universe is represented somehow. Speaking in these terms, the human being turns out to be the culmination of all creation and the most important and complete subject of study. Thus, it should be known how minerals grow in order to understand how illnesses spread into the human body and how to face them; and also the correspondence between stars and planets, minerals; plants and human body's parts to combine ingredients in a medicine effectively. According to Paracelsus, medicine is one of the most important sciences, because its aim is the health of the human race but also because it collects and unites in itself the knowledge of the other sciences, studying the human being, mirror of the whole universe (Pagel 1982).

The idea of macrocosm-microcosm correspondence in the interpretation and analysis of the

world pervades Renaissance philosophy and is behind the interdisciplinarity that characterizes the Renaissance philosophers: to fully understand an interconnected world, a philosopher is required who may analyze every field of science, and who can interpret the interconnections that run through every item of the universe.

Abstract

Poet, critic, and theorist, Minturno had a prominent role in his own times (and one that was certainly greater than that attributed

to him in the last few centuries) in the birth and consolidation of poetic thought in the second half of the sixteenth century. His work is characterized by a particular interest in the vernacular tradition, posited in the direct line of descent from the Latin tradition; a highlight of the doctrinal dimension of poetic writing, constantly brought back to the philosophical and speculative field; a distancing from the chivalric genre (the romance), aimed at basing the structure of epic poetry on Aristotelian principles; and a constant recourse to historical perspective in literary inquiry, in particular to the entire trajectory of vernacular poetry from its origins, from the Provençal writers and the Sicilian school up to Dante. Such passages in M.'s reflections constitute a prefiguring of the poetic thought of Torquato Tasso, who most likely read and reflected on his most important treatise, the *Arte poetica* (Venice, 1564), during his formative period in Padua.

Biography

Antonio Sebastiani (named Minturno) was probably born in Traetto (now Minturno) in 1500. He studied with Agostino Nifo and then he created a literary academy in Naples. In 1559, he published his *De poeta*, and in the same year, he was appointed bishop of Ugento. Between 1562 and 1563, while he was ending his *Arte poetica*, he attended Tridentine Council works. He probably died in 1570–1574 in Crotone.

Heritage and Rupture with the Tradition

Minturno claims the converging of the Classical and Christian tradition on the moral terrain: he attributes to the *Rerum vulgarium fragmenta* a speculative depth that starts from Agostino, Cicerone, and Boezio.

He supports Petrarch's position to the point of assigning him the key player role (*auctoritas*) of the heroic style, alongside Homer and Virgil. By starting from *Tr. Cup.* III, 79–80, he criticizes Ariosto's approach: the epic poems should be centered on a story with a single subject, with episodes aimed to confer magnificence to the narration. Much more: he elevates the sonnet to the greatness of the heroic poem's sublime style. In his opinion, Petrarch could even teach how to achieve Aristotelian dictates of mimesis in epic narration, as he is the poet who writes the story "non qual avvenne, ma come possibil fu" (*Arte poetica*, p. 34).

Innovative and Original Aspects

Thanks to Petrarch's literary prominence, Minturno releases the vernacular language from the subordination to Latin. He regrets the decay and ruin in which vernacular tradition has fallen and aspires to discover in the new vernacular language all the rhetorical expedients useful to touch and to delight.

We can say that Minturno wrote the first systematic treatise about vernacular lyric as he attributed to poetry agnoseological unequivocal power by defining the poetry itself as "arte d'Iddio, con la qual'egli non pur tutto creò [...]. Ma insegnò ancora, come le cose divine in voce spiegar si dovessero" (*Arte poetica*, p. 2).

Impact and Legacy

Beginning with his first work, (the *Dialogo dell'Accademia*), lost during the plague of Naples, but able to be reconstructed in part through his friend Giovanni Andrea Gesualdo's contemporaneous commentary on the *Canzoniere* and the *Trionfi*, Minturno centered his reflection on the pivotal Petrarchan work, read as a shining example of the vernacular as a vehicle of the "prima sapienza [...] che fu la poesia." Here the need to highlight his intellectual weight (*dottrina e ingegno, dottrina e scienza, filosofia*) and the rhetorical wisdom of poetic writing, in the didactic as

well as literary sense, emerges forcefully. Reconstructing (with the aid of Gesualdo's commentary) certain sections of the *Accademia* means retracing the outline of the later *Arte poetica* and illuminating the precocity and grasp of many of the insights developed within it, dating back to the years very close to the publication of the *Prose della volgar lingua*. Thus, the old Minturnian dialogue comes to represent the evidence of a particular interest in vernacular poetry, present in his work at least at the same time as (if not before) the interest in Latin literature, and to map out the framework within which several poetic solutions that were destined to become crucial in the course of the sixteenth century developed, not least of these the converging of the Classical tradition and Christianity on the moral terrain.

From the dedicatory epistle of the *Arte poetica*, written by Minturno, then bishop of Ugento, while he was taking part in the Council of Trent in September 1563, the author's intention to allow scriptural references and Aristotelian principles (the marvels narrated in verse belong to the realm of the possible), and the Classical and Judeo-Christian traditions to interact, is apparent. This approach transpires from the first book, dedicated to epic poetry, which systematically consolidates Petrarch's position to the point of assigning him the role of *auctoritas* of the heroic style, alongside Homer and Virgil. This explains why, from the first argument, Minturno draws on the lively reference of *Triumphus cupidinis* III 79–80 to criticize the vice of the "romances," of chivalric poetry in the Ariostian manner, lost in numerous plots by the lack of aim at a single ending: "Laonde quelle favole sono pessime riputate; nelle quali né verisimilmente, né per necessità veruna intraposte molte cose veggiamo. Quali communemente sono queste, che *di sogni empion le carte*".

According to Minturno's vision – which can be said to be shared by Tassian theoretical reflections – the epic poem should be centered on a story with a single subject, but should nevertheless lack none of the richness and spirit of the episodes (as long as they are in the service of the plot), which are aimed at conferring magnificence and wonder on the narration without disturbing

the proportion, dignity, and appropriate size of the work. To this is tied the need to specify – again following in the wake of Aristotle’s *Poetics* III, 2 – the difference between the “Poet,” who writes the story “non qual avvenne, ma come possibil fu” and the “Historian,” who “narra le cose come sono avvenute,” according to a distinction aimed at pointing out the philosophical nature of poetry and destined to lay the foundations of Tasso’s great theoretical framework.

Abstract

Mīr Dāmād was a leading theologian and jurist in early seventeenth century Persia, a context characterized by the staunch Shī‘ite cultural policy of the Ṣafavid state. As one of the most prominent Iranian philosophers in the early modern era, he drew on the heritage of Avicenna and Shihāb al-Dīn al-Suhrawardī but was not satisfied with merely appending to it by way of commentary. Mīr Dāmād is especially known for his original analysis of the concepts of time and eternity, as well as for having held the controversial doctrine of the metaphysical primacy of essence as opposed to existence. He was a mentor and close friend of Mullā Ṣadrā, whose fame would later outshine that of the older colleague.

Alternate Names

al-Dīn Muḥammad Ḥusaynī Astarābādī, Sayyid Muḥammad Bāqir ibn Mīr Shams; the epithet “Dāmād” (“son-in-law”) derives from his father who was married to a daughter of the prominent cleric ‘Alī Karakī.

Biography

Born in Astarābād in 1561 as the son of a notable jurist who had married a daughter of ‘Alī Karakī, one of the most powerful clerics of the early Ṣafavid era, Mīr Dāmād received his early education in Mashhad from his maternal uncle ‘Abd al-‘Ālī ibn ‘Alī ibn Ḥusayn and Sayyid Nūr al-Dīn ‘Alī ibn Abī al-Ḥasan ‘Āmilī, the son of Zayn al-Dīn ‘Āmilī, another highly venerated scholar and a martyr of the Shī‘ite cause. Thus, Mīr Dāmād was most intimately related by both birth and educational lineage to the highest elite of the Shī‘ite scholars of his time. Around the turn of the 1570s, he moved to Isfahan where he studied with Fakhr al-Dīn Astarābādī, a student of the Shīrāzī philosopher Ghiyāth al-Dīn al-Dashtakī. In the Ṣafavid capital, Mīr Dāmād rose to prominence as one of the city’s leading scholars in theology, jurisprudence, and philosophy. In spite of criticism from more traditionalistically inclined jurisprudents, he remained intimately affiliated to the Ṣafavid court throughout his life, serving in the very prominent position of *shaykh al-Islām* from 1621 until his death in 1631 in Najaf where he was also buried. In addition to his scholarly activities, Mīr Dāmād was well known for his passion and gift for mystically inclined poetry.

About 50 works survive of Mīr Dāmād’s *oeuvre*. Philosophically the most important of these is the *Qabasāt ḥaqq al-yaqīn fī ḥudūth al-‘ālam*, completed during the last decade of his life. The book builds heavily on the Avicennian tradition (for instance, the novel notion of *ḥudūth dahrī* is introduced as a natural outcome of the close analysis of Avicennian texts) but with a strong *ishrāqī* bent. Notoriously obscure, the work has been the subject of several commentaries. Two earlier and incomplete works that develop the theme of time and eternity are *al-Ṣirāt al-mustaqīm* and *al-Ufuq al-mubīn*, while the respective positions of Aristotle and Plato on the question are assessed in a Fārābīan fashion in *Risāla fī madhhab Arisṭātālīs*. Questions related to God and His creation are also dealt with in shorter treatises, such as *Taqwīm al-īmān fī mabḥath wājib al-wujūd wa taqdīsīhi wa tamjīdīhi*, *al-‘Imādāt wa al-tashrīfāt fī mas’ala ḥudūth al-‘ālam wa qidamihi*, and

al-Īqāḍāt fī khalq al-a‘māl wa af‘āl al-‘ibād. Mīr Dāmād’s critical evaluation of Avicennian philosophy, especially the theory of emanation, from a Suhrawardīan point of view is shown in *Jadhavāt va mavāqīt*, a treatise composed in Persian at the behest of the Ṣafavid Shāh ‘Abbās I. Apart from these and other original treatises, he also composed commentaries on selected philosophical and theological texts, including works by Avicenna, Naṣīr al-Dīn al-Ṭūsī, and Sa‘d ibn Manṣūr ibn Kammūna. Apart from philosophy, Mīr Dāmād wrote profusely in jurisprudence, a field in which he represented the strongly rationalistic school championed by his grandfather ‘Alī Karakī, as clearly evidenced in his jurisprudential *magnum opus al-Sab‘al-shadād* as well as in minor treatises. He also wrote commentaries on Shī‘ite *ahādīth* and biographies. Under the pseudonym “Ishrāq,” Mīr Dāmād composed a volume of mystical poetry that is collected in a *mathnawī* entitled *Mashriq al-anwār*.

Heritage and Rupture with the Tradition

In philosophy, Mīr Dāmād’s ambition was to develop a “Yemenite” philosophy that would replace the old Greek paradigm which was notoriously difficult to reconcile with such basic Qur’ānic doctrines as the creation *ex nihilo*. This new approach was to be developed by combining aspects from existing intellectual paradigms – most notably the mainstream of Avicennian Peripateticism, the Sufi doctrine of the school of Ibn ‘Arabī, and the *ishrāqī* doctrine initiated by Suhrawardī – and critically evaluating them in the light of reason and mystically revealed intuition. This is a procedure that shows considerable similarities with Suhrawardī’s description of his chosen method in the preface to the *Hikma al-ishrāq*, and it is nowhere manifested as clearly as in Mīr Dāmād’s famous attempt at solving the problem of how to reconcile God’s immutable eternity with His allegedly temporal act of creating the world.

One of the more obvious sore points in interpreting the monotheistic concept of creation in terms derived from Greek philosophy is due to

the philosophical doctrine of the eternity of the world. Of course, since the philosophers conceded that God alone exists necessarily, they too held that He was ontologically necessary for the world's existence, and this allowed them to interpret the revealed account of creation as a metaphorical version of the same truth. However, there is little room for any kind of free or voluntary act of creation in a conception of the Creator as a mere necessary condition of an eternal world. Thus, the philosophical doctrine could easily be seen to compromise the monotheistically central idea of God's freedom and omnipotence, that is, the idea that had He so preferred, God could just as well have left the world uncreated, or have created it different in kind or at a different instant. An extended theological critique of the philosophers' doctrine along these lines had of course been voiced already by Abū Ḥāmid al-Ghazālī in his *Tahāfut al-falāsifa*, but prior to Mīr Dāmād this particular tension between philosophy and religion seems not to have provided enough of an impact for philosophers to revise their concept of creation into one more readily reconciled with revelation.

Mīr Dāmād's solution takes its cue from a close analysis of the Avicennian distinction between the different senses of coming to be (*ḥudūth*). By means of an array of texts, he characterizes these senses as, first, coming to be in the sense that an essence owes its existence to another (*ḥudūth dhātī*); second, coming to be in the sense that an entity has privation or nonexistence as its metaphysical counterpart that needs to be overcome in order that the entity can exist (*ḥudūth dahrī*); and, third, coming to be in a given moment of time that is preceded by other moments of time (*ḥudūth zamānī*). He then explicates these three types of coming to be as entailing three hierarchically related realms of existence that are distinct in their relation to motion and the measure of motion, that is, time. The highest of these realms is that of eternity (*sarmad*), and it is a type of atemporality that is unique to the absolute immovability of God. Below eternity and ontologically dependent on it, Mīr Dāmād posits another atemporal realm which he calls "perpetuity" (*dahr*) and which consists of the separate intellects and the

essences of worldly things considered as static atemporal entities. Finally, the essences existing in the level of perpetuity are found to unfold in time (*zamān*), the realm of physical entities that are subject to motion and thereby exist in time. Conceived in this way, the realm of perpetuity can be said to bring temporal entities to be and to govern their development in time according to the Neoplatonic principles of origination (*mabda'*) and return (*ma'ād*), albeit not absolutely, for the perpetual entities themselves owe their existence to the sole eternal existent, God.

Under a schematic description, Mīr Dāmād's threefold analysis may appear as strikingly derivative, spiced perhaps with a slightly renewed terminology. Indeed, it can duly be claimed that his description of existence within and without time is a rephrasing of the Neoplatonic theory of the three hypostases, with *sarmad* corresponding to the One, *dahr* to the Intellect, and *zamān* to the level of Soul. Mīr Dāmād's novelty, if there is one, is in his sustained attempt to conceive of the relation between the two superior levels in terms of genuine *ḥudūth*, instead of mere logical dependence. Despite the fact that in themselves and in their relation to God, the perpetual intellects and essences are atemporal and unchanging, Mīr Dāmād insists that they *have been* created and *have come* to be from Him, only this coming to be is *dahrī* and not situated in time.

The question then is, of course, how the central notion *ḥudūth dahrī* is to be understood. The notion may not be entirely devoid of conceptual mysticism, for Mīr Dāmād himself openly admits that this pivot of his attempted solution is particularly prone to escape the grasp of our reason. It is clear, however, that he is trying to substantiate a distinction between two senses of eternal existence, one proper to God, the other to the world, as well as to elucidate the relation between the two ways in which we can consider the world, namely, as a collection of entities that are *in* time (in the sense of existing in the past, present, and future tenses) and as an atemporal whole that contains, but is itself not in, time. Indeed, it has been suggested that Mīr Dāmād's *dahr* should be understood as something akin to McTaggart's famous concept of the B-series of time, that is,

as a whole containing all the created entities in their various relations to each other, or the line of the entire “world history” considered from an atemporal perspective (Rahman 1980). Understood in this way, the realm of *dahr* can mediate between the absolute atemporality of God and the temporality of worldly entities precisely by combining the two aspects – atemporality in its own mode of existence and temporality in its internal structure which then gets unfolded in time. On such a basis, Mīr Dāmād can say that the initial problem of the eternity of the world vanishes once we disequivocate the two senses of “eternal”: the world is “eternal” in the sense that the flow of time has neither beginning nor end, but this does not mitigate the fact that the world as an atemporal whole in the realm of *dahr*, as the very principle of all temporal existence, can only exist because God has undone its nonexistence by creating it.

It has been noted that Mīr Dāmād’s solution to the problem of the world’s eternity is intimately connected with other traditional questions, such as those of God’s knowledge of particular things and of the relation between His omniscience and future contingency. Frustratingly, though, Mīr Dāmād leaves many of these implications undeveloped, a fact which may in part explain why the theory was not received with as high acclaim as Mullā Ṣadrā’s alternative theory of the God-world relationship founded on an analysis of existence.

Apart from his analysis of time and eternity, Mīr Dāmād is famous (or notorious) for having held the metaphysical theory of “primacy of essence” (*aṣāla al-wujūd*). This theory, heavily criticized by Mullā Ṣadrā, is motivated by the Avicennian distinction between the essence and existence of contingent entities. Mīr Dāmād argues that although we can make a distinction in analysis between these two constituents of the contingent thing, they cannot be really separated from each other. But since the contingent thing is evidently a unitary whole, and since it is inconceivable that both concepts – that is, “essence” and “existence” – are mere fictions introduced in the analysis, one of the two constituents must be primary and independent of the analysis. According to Mīr Dāmād, who here seems to be following Suhrawardī’s critical discussion of the

concept of existence in the *Ḥikma al-ishrāq*, the primary constituent is essence. It is interesting, however, that he differs from Suhrawardī in the closely related debate over Platonic forms, holding that the forms are not eternal self-subsistent entities but rather structural principles of creation subsisting in God’s mind.

Impact and Legacy

Venerated as the “Third Teacher” (after Aristotle and al-Fārābī), Mīr Dāmād wielded considerable influence in subsequent Persian philosophy through his students, the most important of whom was without doubt Mullā Ṣadrā. Although Ṣadrā departs from his mentor in a number of key questions and would later overshadow him in renown, this was not always the case, and for some time Mīr Dāmād’s philosophy was considered superior to that of his younger colleague. Especially the *Qabasāt* was favored by commentators, such as Mīr Dāmād’s students Sayyid Aḥmad ‘Alawī ‘Āmilī and Mullā Shamsā Gīlānī, not least because of the notorious difficulty of the text. His works, especially *al-Ufuq al-mubīn*, were also widely studied in India.

Abstract

In early modern Hebrew usage, the verb *leha-atik* means to translate, to copy, or to transfer. Leon Modena used the verb regularly to describe his activities, which represented the Renaissance ideal of *translatio studiorum*, i.e., the transfer of culture across both time, and space and also among various groups. Through out his life and work, Modena used his position at the center of the Venetian Empire to transfer Jewish culture between Jewish centers in Italy, elsewhere in eastern and western Europe, and the Ottoman Empire; from Greek, Latin, Catholic, Protestant, and Muslim culture to Jews; and from Jewish tradition to Christians, including major scholars in Venice and abroad, who in turn incorporated his work into their Latin works. Modena also transformed Jewish culture as he engaged in critiques of tradition and current practice, created new vehicles of Jewish cultural creativity, reclaimed the past and made it accessible, and developed methods of conveying Jewish culture to Christians and to Jews of all levels of education. Modena was neither typical of Renaissance rabbis nor was he unique, but he was talented and prolific.

Biography

Modena’s life is highly documented. He wrote an autobiography, the first Hebrew autobiography

(*Hayyei yehudah*), unpublished in its entirety until the twentieth century and recently translated into English and Italian with introductions and notes (Modena 1984b, 1988; Min-Halleviyyim 1985). In it, he presents a synoptic survey and assessment of his life and work, which provides valuable insights into the development of his self-consciousness in the context of his family, the Jewish community, and the Christian circles of early modern Venice. Further documentation is to be found in his letters, rabbinic responsa, and introductions to poems, as well as in the writings of his contemporaries and in the Venetian archives (Modena 1907, 1984a). Born in Venice, Modena spent his youth in smaller towns in the region, where he was a precocious student of traditional rabbinic learning and of secular subjects, such as poetry, letter writing, music, dancing, Latin, and Italian. Because of increasing restrictions placed on ordination, Modena had to wait until he was almost forty before he could function as a rabbi, cantor, and community official in Venice. Until then, he created his own opportunities for income and creative expression by serving as a teacher, preacher, correspondent, translator, publisher, editor, commentator, polemicist, and poet. His life was also marred by many family tragedies, including the loss of most of his children, physical illness, depression, poverty, and gambling, for which, unfortunately, he is often the best known.

Heritage

Modena's work involved the preservation of the Jewish heritage by creating a rupture within it. Such was his legacy of innovation, although modern scholars, not fully aware of his own context but only of theirs, mistook his originality for subversion. Modena was fully fluent in all of traditional biblical and rabbinic literature and able to produce vigorous, sometimes witty, Hebrew prose and poetry that integrated all stages in the development of Hebrew. He edited commentaries (*Mikra gedolah*), anthologies (*Bet yehudah*), and indices (*Bet lehem yehudah*) of classic rabbinic materials.

He also published prayers (*Tzori lanefesh* and *Tefilat yesharim*). His sermons, which he modeled on classical forms of rhetoric and recent developments in Christian preaching, attracted hundreds each week, including Jews and Christians (*Midbar yehudah*). Modena became a respected rabbinic authority in Venice and beyond whose decisions were frequently solicited on major issues as well as on minor points of law (*Ziknei yehudah*) (Modena 1956). However, only small traces of his work appear in Jewish canonical texts, such as his commentary, *Haboneh*, in the rabbinic compendium *Ein Yaakov* and his liturgical prayer *Yom zeh yehi mishkal* in the prayer book. He taught advanced Jewish students and, to his chagrin, children, as well as Christians. His educational innovations included using memory techniques (*Lev ha-aryeh*), a dialogue on gambling (*Sur mera*), and riddles and magic formulas (*Sod yesharim*).

Several works stand out as a contribution to *translatio studiorum*. In his Hebrew translation of the popular collection of classical ethical wisdom, *Fior di virtù*, he removed the blatant Christian passages, or at least dropped the Christian attributions, and added biblical and rabbinic sayings (*Tzemah tzadik*). He translated classical works, sections of the Italian romance classic *Orlando furioso* by Ludovico Ariosto into Hebrew and the Passover Haggadah into Italian. Because the Church did not allow the vernacular translation of the Bible, Modena produced grammars and parallel vocabulary lists of Hebrew and Italian that followed the order of the biblical text (*Galut yehudah*), which he later expanded with rabbinic vocabulary lists (*Pi aryeh*). Indeed, Modena's turn to the earliest levels of Hebrew texts and Hebrew grammar represented a return to the bedrock of Hebrew intertextuality. His program for renewal of the classics is what his contemporaries would designate *renovatio*.

Innovative and Original Aspects

Modena further developed Jewish culture in a way that attracted Jews and Christians but aroused the ire of some traditional Jews, whom he called

mithasedim, i.e., those who present themselves as pious. His innovations, actually imitations of the surrounding culture, included Hebrew art music and a method for publishing the words and the notes, which run in opposite directions, an accommodation of Jewish innovation with secular culture (*Shir hashirim asher lishlomo*). He established a Jewish musical academy in Venice, which was invited to join a Christian musical academy (Roth 1928). Modena's involvement with contemporaneous theater included writing and producing plays on biblical themes (*L'Ester*). His rabbinic writings included traditional approaches to controversial practices within the Jewish community, such as going about bareheaded, playing tennis on the Sabbath, using an hourglass to time sermons, and gambling. His Hebrew poetry drew on the religious traditions of synagogue poetry, on secular themes in medieval Hebrew literature, and on contemporaneous Italian verse styles and themes, such as wine, food, and panegyric. He also wrote Italian poetry and made a major contribution to the *traditio studiorum* with his *Kinah shemorah* or *Chi nasce muor*, a macaronic poem that translates itself because it reads equally in Hebrew or Italian (Modena 1932).

Impact and Legacy

Although most of the books he published during his lifetime have been republished, they remained ephemeral, despite their significance for understanding his contribution to the transfer of culture in the Renaissance. Modena's major works remained in manuscript, so while they were known among antiquarians and bibliophiles, it was not until the nineteenth century that these works began to appear in print. Modena's major unpublished works deal with defining and defending Jewish tradition from three challenges to it. He saw the arrival of a new wave of Jewish mysticism, Kabbalah, especially Lurianic Kabbalah from Safed in Palestine to Italy, and the use to which Christians put it to convert Jews, as a threat to Jewish tradition.

Kabbalah literally means tradition, so Modena's writings against Kabbalah and transmigration of souls dealt with the question of what constituted the true tradition of Judaism. To defend rabbinic tradition and authority, he invoked the seminal Jewish philosophers of the middle ages, such as Saadia and Maimonides, and he used historical criticism to challenge the legitimacy of kabbalistic tradition (*Ari nohem*, *Magen veherev*, and *Ben david*) (Modena 1929, 1960). Nevertheless, as much as he opposed Lurianic Kabbalah, he himself engaged with kabbalists, Jewish and Christian, and wrote, taught, and preached kabbalistic-inspired materials.

Another challenge to rabbinic legitimacy came from crypto-Jews from the Iberian Peninsula, especially those in the growing Sephardic diaspora in the European port cities. Their challenges reflect the breakdown of traditional Judaism influenced by the anti-Jewish Catholic environment and by the disruption of rabbinic authority under the Inquisition. Modena copied two Hebrew manuscripts challenging rabbinic authority, each of which also contains a counter-polemic in a defense of rabbinic Judaism (*Magen vetzinah* and *Kol sakhal – Sha-agat Aryeh*) (Modena 1852, 1856). A major aspect of understanding Modena's attitude to rabbinic Judaism involves the controversial question of whether he was the author of the tracts or of the defenses, or of both, or of neither, highlighting his role in transmitting defense of rabbinic authority as well as a critique of it.

Christianity continued to pose a challenge to the legitimacy of Judaism and the presence of Jews. In his responses, Modena engaged in the usual apologetics and polemics to vindicate Judaism, but his innovations included conveying a nuanced understanding of Judaism to Christians and of Christianity to Jews (Ancona 1963–1964; Roth 1929, 1951–1952; Sonne 1948). On the one hand, he wrote *Historia de riti Hebraici*, the first systematic vernacular presentation of Judaism for the reading public by a Jew. The *Riti* was republished many times and translated from Italian into many European languages as well as Yiddish and Hebrew for Jews.

On the other hand, he referred to Jesus as a good man (*uomo da bene*). Modena's relationships with Christians, which included teaching, speaking, exchanging books, writing poems, corresponding, and debating, brought him into contact with members of the major intellectual circles of Europe, especially those involved with the *accademie*, i.e., intellectual societies that emerged as part of the international Republic of Letters. These interactions introduced him to the growing skeptical movement in Europe, and his writings and his commonplace books include references to Galileo and Cesare Cremonini, among others. The thinking of these circles is reflected in his writings about Aristotle, the immortality of the soul, the eternality of the world, heliocentrism, and *ragion di stato* as he engaged in the transfer of culture between early modern Jews and Christians, between ancients and his contemporaries, and between the ghetto and Europe. While interacting with Christians and Jewish dissenters beyond the ghetto, as well as inside, he was able to contribute to a meaningful exchange of culture while at the same time remain a staunch defender of Judaism, a paradoxical relationship of imitation and competition.

Abstract

Giuseppe Moletti was a nobleman, born in Messina, Sicily, in 1531. He was a renowned mathematician, cosmographer, and geographer during his lifetime and is best known for his

Dialogo intorno alla Meccanica (Dialogue on Mechanics) (1576). He lived in Venice (1560–1570) practicing medicine, was the tutor of the Duke of Mantua Guglielmo Gonzaga's son for 7 years (1570–1577), and, finally, until his death, he held the Chair of Mathematics at the University of Padua (1577–1588), following Pietro Catena and preceding Galileo Galilei. During his time in Padua, Moletti was connected with many of the major scholars of his time and was a pivotal figure in the transformation of Aristotelian mechanics into a mathematical science in the generation before Galileo Galilei. He also compiled *Ephemerides* (astronomic tables) and was appointed, by the Senate of Venice and Pope Gregory XIII, to be one of the reformers of the new ecclesiastical calendar. He died in Padua in 1588 and was buried in the Church of Saint Francis, close to the University.

Biography

Giuseppe Moletti was born in Messina, in 1531, into a fallen noble family. He studied at the Collegio of the Society of Jesus in Messina, where he was a student of Francesco Maurolico. Before 1560, he left Sicily for Padua, where he probably received his first academic degree studying with Pietro Catena and Francesco Barozzi. After a brief stay in Verona, where he taught as a private geometry and astronomy tutor, he moved to Venice, where he practiced as a doctor and devoted his time to teaching and researching. During this time in Venice, he published his first works on geography, astronomy and geometry. In 1561, he published for the first time, as an appendix to Girolmo Ruscelli's Italian translation of Ptolemy's *Geography*, his *Discorso universale . . . nel qual son raccolti e dichiarati tutti i termini*

e tutte le regole appartenenti alla Geografia. In 1562, he published a new edition of W. Pirkheimer's Latin translation of Ptolemy's *Geography*, dedicated to the Cardinal Alvise Cornaro (Corner). In 1563 he began the publication of the *Ephemerides* (astronomic tables), written in Italian vernacular and compiled until 1580. All three works were published in Venice by Vincenzo Valgrisi. A Latin edition of his *Ephemerides*, instead, covering the years from 1564 to 1584, was published in Venice by Francesco Francischio. The Italian version of the *Ephemerides* was introduced by a long dedication to Giovanni Battista Fagnano and Nicolò Primo (two of Moletti's friends) in which Moletti presented his understanding of Astronomy as divided into proper Astronomy (the physical phenomena) and Astrology (the effects on the Earth and its inhabitants) (see Dollo 1988; Favino 2011; Ferrari 1943; Nappo and Noto 2002).

After recovering from a serious disease, in 1570, Moletti moved to Mantua, where he served as a tutor of the Duke Guglielmo Gonzaga's son for 7 years. Here, in 1576, he started composing *Dialogo intorno alla Meccanica* (Dialogue on Mechanics), the work he is best known for. It was a praise of the science of mechanics written in vernacular and addressed to a non-academic audience with the purpose of legitimizing it as a proper Science. The *Dialogue* is divided into 2 days. On the first day, Moletti discusses the fundamentals of Mechanics. Grounding his discourse on Archytas' (Pseudo-Aristotle's) *Quaestiones mechanicae*, Moletti tries to determine the geometrical principles of Aristotelian mechanics. On the second day, he tries to extend Mechanics to the realm of Natural Philosophy. Elaborating on Aristotle's *De motu animalium*, Moletti tries to explain all motions through the analysis of their forces and resistances, and discusses the speed and acceleration of falling bodies anticipating some of Galileo Galilei's future experiments on the same topic. The *Dialogue* was left unfinished when, in 1577, Moletti left the Gonzaga court to move to Padua, where the Republic of Venice offered him the Chair of Mathematics at the University of Padua, left vacant by

the death of Pietro Catena. Moletti held the position until his death in 1588 (see Favaro 1894; Favino 2011; Laird 1986, 1987, 2000; Lohr 1978).

During his time in Padua, Moletti was connected with many of the major scholars of his time. He was a close friend of the humanist Gian Vincenzo Pinelli, host of a circle of humanists from all over Europe, including the young Galileo Galilei. He was a pivotal figure in the formation of the new science of Mechanics in Italy and his unfinished *Mechanics* offers a perfect look at the transformation of Aristotelian mechanics into a mathematical science in the generation before Galileo. Appointed by the Senate of Venice and by Pope Gregory XIII, Moletti also worked towards the reform of the ecclesiastical calendar publishing the treatise *De corrigendo ecclesiastico calendario* as an appendix to his astronomical tables (*Tabulae Gregorianae*). He calculated his *Tabulae* using the Copernican system and argued in favor of using the real movements of the stars to calculate the calendar, but the commission, in the end, preferred to use the traditional way (see Laird 1986; Carugo 1984; Coyne 1983; Favaro 1894; Favino 2011; Rose 1976; Tomasini 1630, 1654; Venturi 1818).

His manuscripts and the documents from the University of Padua, today preserved at the Biblioteca Ambrosiana in Milan, demonstrate the extent of his interests. He taught courses on Euclid's *Elements* and on Aristotle's *Mechanics*, on the sphere, optics, perspective, cosmography, geography, anemography, and hydrography. He was also a prolific writer, though many of his works remain unpublished. His unpublished notes contain commentaries on Euclid's *Elements*, Archimedes' *Sphere* and *Cylinder*, Alhazen's *Optics*, Sacrobosco's *Tractatus de Sphaera*, Archytas' (Pseudo-Aristotles') *Mechanika* and Copernicus' *De revolutionibus* (see Padadopoli 1726; Rivolta 1933; Tomasini 1630, 1654).

Moletti died in Padua, in 1588, while he was still teaching at the University of Padua and was buried in the Church of Saint Francis, close to the University. His position, teaching Mathematics at the University of Padua, was filled by Galileo Galilei.

Abstract

Luis de Molina, S.J., was a Spanish Jesuit philosopher-theologian who was a prominent figure in the second scholasticism that flourished in the Iberian Peninsula in the sixteenth and seventeenth centuries. Born in Cuenca in 1535, Molina eventually studied at some of the most prominent universities in Spain: Salamanca and Alcalá. He is perhaps most famous for his *Liberi arbitrii cum gratiae donis, divina praescientia, providentia, praedestinatione et reprobatione Concordia*, a work that sought to reconcile human freedom with divine grace and foreknowledge. The work was fiercely contested by a number of theologians, mostly Dominicans, who accused its Jesuit author of Pelagianism. The dispute played into the *de Auxiliis* controversy that was only settled through papal intervention. In addition to his work on grace and freedom, Molina also authored a commentary on the prima pars of Thomas Aquinas's *Summa theologiae* as well as a vast work devoted to law and moral theology, the *De iustitia et iure*. Molina died in Madrid in 1600 before the latter work could be completed.

Biography

Luis de Molina, S.J. (September 1535, Cuenca–12 October 1600, Madrid), was a Jesuit

philosopher-theologian who is most famous for his role in the fierce *de Auxiliis* controversy that raged over issues concerning the relationship between grace, human freedom, and divine foreknowledge. He was born in Cuenca, located in central Spain, in September 1535 to Diego de Orejón y Muela Hidalgo and Doña Ana García de Molina (Solana 1940, 401). As a youth, Molina began his studies in Cuenca, where he studied Latin for 4 years, but in 1551 he continued his education at the University of Salamanca, where he studied law (Kaufmann and Aichele 2014, xiv). Molina remained in Salamanca for only about 1 year before moving to Alcalá where he studied logic (*ibid.*).

While studying the logical *Summulae* that were an element of the curriculum at Alcalá, Molina answered a call to religious life (Solana 1940, 401). Aged only 13 years, on 10 August 1553 the future Spanish theologian joined the fledgling Society of Jesus, which had just been founded in 1540 (Kaufmann and Aichele 2014, xiv). Molina left Spain for Coimbra by foot and begged along the way as would be expected of a young man for whom religious poverty would be a way of life (Solana 1940, 401). Molina continued his studies as a novice at the University of Coimbra, where he studied philosophy between 1554 and 1558 (Kaufmann and Aichele 2014, xv). There is some disagreement about whom Molina may have studied under at Coimbra; some hold that he had as his teacher none other than Pedro da Fonseca, the “Portuguese Aristotle” (Solana 1940, 401), while others deny this and insist that Molina had Sebastian Morales as his mentor (Kaufmann and Aichele 2014, xv). Whether it was Fonseca, Morales, or even Ignatius Martins (*ibid.*), what cannot be doubted is the outlook of Molina's philosophical education which would have been thoroughly Aristotelian. He was at Coimbra, after all, whose association with the Conimbricenses, commentaries devoted to almost the entire *corpus Aristotelicum* – ranging from logic to the philosophy of nature, metaphysics, and ethics – is legendary. Molina completed his philosophical formation in 1558 and immediately began his theological studies. At last, he was ordained to the priesthood in 1561 (*ibid.*, xv).

While still in the midst of his theological studies, Molina would, from time to time, teach philosophy at Coimbra, a responsibility that was formalized as a professorship there between 1563 and 1567 (ibid.).

Meanwhile, Cardinal Infante Don Enrique, who would later become the king of Portugal, was busy establishing a university in Évora located in south-central Portugal. As part of Cardinal Enrique's plans were to promote Portuguese interests within the Catholic Church and draw the Jesuits deeper into Portugal, in 1559, he transferred control of the University of Évora to the Society of Jesus (ibid.). Later, Enrique petitioned the Society of Jesus to send Molina as a professor, which summons Molina who answered and accepted a position teaching theology at the University of Évora from 1568 until his retirement in 1583 (ibid.). So successful was Molina's tenure at the university that he eventually attained the title "Doctor of Évora" (Solana 1940, 402). Though most of his philosophical and theological texts had been written during his career at Évora, it was not until his retirement from teaching that Molina was able to seek their formal publication (Kaufmann and Aichele 2014, xvi), a task that was beset with difficulties and controversy. He published his *Concordia liberi arbitrii cum gratiae donis* first in Lisbon in 1588 followed by a second edition which responded to several critiques in Antwerp in 1595. In 1592 Molina published his commentary on the first part of Thomas's *Summa theologiae* in Cuenca. Finally, between 1593 and (posthumously) 1613, he published his *De iustitia et iure* (ibid.). A disagreement with the chancellor of the University of Évora sometime between 1584 and 1586 prompted Molina's departure and return to Lisbon, where he continued to work on his publications (ibid.). In 1591 Molina returned to Spain and once again took up residence in his native Cuenca; here, he was able to bring to publication, as noted above, several volumes of his *De iustitia et iure*, a second edition of the *Concordia*, and his *Commentaria in primam divi Thomae partem* (ibid.). Finally, in 1600 he was to teach moral theology at the Colegio Imperial de Madrid, but shortly after

taking up his appointment, the Jesuit died on 12 October 1600 (Solana 1940, 402).

Concordia liberi arbitrii cum gratiae donis

Perhaps one of the most fiercely contested and studied works of all time (Freddoso 1988, viii; Solana 1940, 402), Molina's work on human freedom and divine grace, known often simply as the *Concordia*, unfolds in seven parts mainly as a commentary on several key articles from the *prima pars* of Thomas Aquinas's *Summa theologiae* – more specifically q. 14, aa. 8, 13; q. 19, q. 6; q. 22, aa. 1–4; q. 23, aa. 1–5 – as well as a series of disputed questions that follow. The first part of the *Concordia* raises questions on the power of free choice; the second part discusses God's concurrence; the third part addresses the assistance of divine grace; the fourth part takes up the vexing question of divine foreknowledge and is the locus of Molina's discussions on middle knowledge; the fifth part takes up the divine will; the sixth part wrestles with providence; and the final part deals with predestination and reprobation (Freddoso 1988, x). Though commentaries on the *Summa* were a standard academic practice of Iberian scholasticism, Molina's work was no mere commentary and it was opposed from the very beginning by those who took Thomas Aquinas as their philosophical and theological standard: the Dominicans. Be that as it may, if Molina's work set off a massive conflagration that consumed some of the brightest intellects in the Catholic Church – principally among the members of the Order of Preachers (Dominicans) and of the Society of Jesus (Jesuits) – it is because conditions for such a firestorm had already been set in place not only with Lutheran and Calvinist interventions on the subjects of grace, freedom, and predestination but also with controversies surrounding Jesuit teachings on grace in Louvain between Michael Baius and the Jesuit Leonard Lessius. The Council of Trent had already addressed doctrines concerning justification in reacting to Pelagianism, Semi-Pelagianism, Lutheranism, and Calvinism. But, as Pope Paul V noted in an address to the legate of King Philip III, the Council of Trent, though it affirmed that human freedom can assent or dissent

from the assistance of divine grace, does not explain exactly “how grace works” (Denzinger 2012).

Molina intended to provide this explanation of just “how grace works” with the *Concordia*. But despite its irenic title and purpose, it succeeded only in pitting Dominicans – following the banner of Domingo Báñez who pushed the “Thomist” account in the fray – against Jesuits, who sought to exonerate their confrere from the charges of heresy laid at his feet. At the time of the publication of the first edition of the *Concordia* – 1588 – the Society of Jesus, having been established less than 50 years earlier, was relatively young and it was no surprise that accusations of theological novelty should be hurled at Molina’s teaching. Difficulties began as soon as Molina attempted to seek approval for the publication of his manuscript. Having received the approval of his Jesuit superiors for its publication, Molina next had to seek permission from the Portuguese Inquisition, which handed the manuscript over to their censor, the Dominican Bartolomé Ferreira (Solana 1940, 402). From Ferreira the Dominicans learned of some of the claims made in the *Concordia* and judged them to contain significant errors and tried to have their Dominican confrere in the Inquisition prohibit the volume’s publication. Ferreira, however, was of a different mind and permitted the publication of the *Concordia*, which went to press in Lisbon in 1588 and was even dedicated to the Archduke Cardinal Albert of Austria who was the governor of Lusitania and chief inquisitor (ibid., 403). The Dominicans, however, appealed to Cardinal Albert himself to halt the publication of the work until an investigation could be made into whether the *Concordia* maintained opinions that the Spanish Inquisition had prohibited from being taught in the schools. Molina’s own communications to Cardinal Albert and assurances of orthodoxy disarmed the situation, and publication of the volume proceeded without obstacle (ibid.).

Even with the *Concordia*’s publication, the matter was far from settled and questions about Molina’s orthodoxy were raised by the Dominicans. The Spanish Inquisition was forced to enter the controversy, but the situation got so out of hand that it required an intervention by the pope himself, Clement VIII, to restore a relative peace

(ibid., 403). In November 1597, the pope convened the *Congregatio de Auxiliis* – a commission established in Rome to examine the theological doctrines in question so that clarity could be attained and, along with it, finally some resolution to the ongoing dispute – which convened on 2 January 1598 (Vansteenberghe 1929, col. 2154). Fundamentally at issue was the question of how human freedom could be preserved while recognizing that divine grace is the cause of any meritorious action whereby one’s salvation could be attained. Complicating the matter further was the issue of how divine foreknowledge, which surely encompasses one’s future free contingent choices, is compatible with freedom, which the latter, as far as disputants in the matter were concerned, is firmly established scripturally. As history recounts, Molina’s effort to give each aspect of dilemma its own due generated his notion of divine “middle knowledge” (*scientia media*), that is to say, the knowledge that God has of future contingents (*futuribilia*).

For the Dominicans as well as the Jesuits, grace was absolutely necessary for man’s justification. But the Dominicans were adamant in prioritizing God’s grace above all such that it functions as a kind of cause of human freedom, that is to say, grace operates with a kind of “physical predetermination” (*praedeterminatio physica*) in bringing about a certain free action (Denzinger 2012). To the Jesuits, however, the Dominican position appeared Calvinistic insofar as it seemed to undermine and even negate human freedom. Molina sought to reconcile the two (grace and freedom), which he did on the basis of his larger metaphysical vision of the causal relationship between God and creation. God is an absolutely necessary being who is the source of all being. What is more, God creates, not out of any necessity but freely, giving being to creatures that are themselves entirely contingent. Creation’s contingency does not eviscerate its own efficacy and ability to act, for, in producing a creature, God thereby gives creatures their own proper natures through which not only do they have being but also through which they exercise their own proper agency or causal efficacy (*Concordia*, II, d. 25–28). One might say, then, that in exercising its own causal efficacy, the

creature imitates in a particular way the absolute and universal causality that God exercises.

For Molina, then, both God and creatures are real – the former necessary and the latter contingent – and both communicate their being causally, God as a universal cause and creatures as particular causes. Though their causation can be distinguished, they cannot be separated entirely for the reason that no creature can exercise its own causality without the simultaneous sustaining causality of God. Molina describes God's causal role in creation as a kind of *concursum generalis* (ibid., I, q. 14, a. 13). Yet, creaturely secondary causality has its own nature and logic such that the effects stemming from secondary causes receive their own nature and the powers to act attendant upon that nature, not immediately from God, but from their immediate particular, secondary causes (ibid., IV, d. 47, 11–12). So, for example, two human parents act with their own causal efficacy that stems from the various orders of causality proper to their natures in begetting offspring and communicate their own human nature to their offspring. God's general *concursum* is of course operative throughout the parents' begetting their child insofar as the parents would have no reality whereby to exercise their causal efficacy if God did not sustain them in being. Nevertheless, the nature the child (effect) has stems immediately from the parents' nature itself. What is more, any defect within a secondary cause can also have an impact on its effects. Parents with congenital defects, for example, can pass hereditary diseases on to their children. In this case, just as God was not the immediate cause of the effect brought about through secondary causality, He likewise is not the immediate cause of any defect which might result from secondary causation. In this latter case, Molina explains that God's causal efficacy is always "sufficient" even if not always "efficacious" (Freddoso 1988, 38–42).

What distinguishes Molina from his Báñezian Thomist opponents, however, is what constitutes the nature of the difference between "sufficient" and "efficacious" grace in the area of moral action. When it comes to free secondary causes, their actions, when considered from the perspective of divine providence, are either intended by God or

merely permitted by God. God concurs with the moral (or immoral) actions that free secondary causes produce in the sense described above, and any immoral action perpetrated by free creatures, like any creaturely defect, is traceable immediately not to God but to the moral agent itself. Now, when it comes to humans, given the Christian doctrine of original sin and the fall of human nature, there is an inclination toward evil actions, yet one can overcome that inclination with, and only with, the assistance of divine grace, especially as mediated through the merits of Christ's death and resurrection. Nevertheless, because humans are free creatures, they can either choose to cooperate (assent) with that grace or resist it. In the first case, both Molina and Báñez would agree that the grace free creatures are offered and have accented to is "efficacious," which is to say, the grace produces the intended result that God's providence ordained. When one resists God's grace, however, though that grace was present and freely offered, it was only "sufficient," which is to say, the grace was sufficient for the person to perform some good act but it was inefficacious since the moral agent rejected the grace in acting for some inauthentic or immoral end. In both circumstances, secondary agents' moral or immoral actions, God functions as a concurrent cause, for without that causality, the moral agent would have no being with which to exercise any kind of moral action whether good or evil (ibid.). But, any defect in the actions caused by a secondary agent – here a free or moral secondary agent – is still not attributable to God but instead to a defect within the secondary agent itself (ibid., 17). God's grace – at least with respect to free secondary causes – is the constant, but the question is what renders that grace "sufficient" or "efficacious"? Is there a real metaphysical distinction between the two, which would stem from God's own creative initiative, or is the distinction a consequence of the moral agent who received the grace?

For the Dominicans, the difference between efficacious and sufficient grace was a real distinction between two different kinds of grace. For Molina, however, the distinction is relative to the free will of the moral agent. That is to say, grace in

itself is neither intrinsically efficacious nor sufficient but is “neutral” (ibid., 18); if the moral agent cooperates with grace, then it becomes efficacious; if, however, the agent resists it, then that grace is only sufficient. The deciding factor here is the free will of the moral agent. To the Dominicans’ eyes, Molina’s positions must have reeked of Pelagianism because it seemed to elevate human freedom above divine grace. Of course, to the Molinists and those within the Society of Jesus who supported Molina, the Dominican position must have seemed tantamount to a sort of Calvinist predeterminism. But a theoretical problem existed for Molina as well. If God’s grace was not in itself efficacious and relied on the contingency of the human will, how could God be said to have foreknowledge about what contingent actions would result from God’s offer of grace to free moral agents? Molina’s solution to this problem was his theory of “middle knowledge.”

To speak of “middle knowledge” here is to locate such knowledge between God’s natural knowledge and free or volitional knowledge. Both Thomists and Molina agree that God’s knowledge is not dependent upon exterior beings or states of affairs as is the case with humans whose knowledge stands in potency with respect to the actual existence of some knowable object. Molina’s *Concordia* opens precisely with this issue in mind when he expands upon Thomas’s *Summa theologiae* I, q. 14, a. 8 wherein it is asked whether God’s knowledge is the cause of things. Thomas’s answer of course is “yes,” which accommodates rather nicely the Báñezian theory of *praedeterminatio physica* in which God’s grace functions as the cause of human liberty. But for Molina, God’s (fore)knowledge vis-à-vis His creative causality must be nuanced. On one hand, there is God’s natural knowledge or, as some have called it, His pre-volitional knowledge (ibid., 3). This is the knowledge that God has of Himself and of all metaphysically necessary truths including what is entailed in logical possibilities (i.e., possible worlds). Included in this knowledge is God’s awareness of all (logically) possible states of affairs that He could freely choose to create. On the other hand, God has “volitional knowledge” or “knowledge of vision,” which

results from His choosing to bring about one of the states of affairs of which He has pre-volitional knowledge, that is, of things as they actually do in fact exist (ibid.). Between these two forms of knowledge is the *scientia media* which regards *futuribilia*, that is, metaphysically contingent truths or counterfactuals. With such middle knowledge, God knows what choice(s) a moral agent would elect if given a certain set of circumstances or antecedent state of affairs. In other words, as Molina sees it, God, in addition to knowing metaphysically necessary truths (pre-volitional knowledge) and what is actually the case or what has been created (volitional knowledge), also knows contingency itself or conditional truths.

These three moments of divine cognition can be understood along the lines of *modus ponens*. In the conditional proposition “if *p*, then *q*,” God’s pre-volitional knowledge would correspond to the antecedent (*p*), and His middle knowledge would correspond to the consequent (*q*). The proposition is itself entirely contingent for it is merely conditional and God need not realize or create “*p*.” Instead, given His absolute freedom, God could choose any number of antecedent conditions, and since He is omniscient, God knows every possible antecedent. What is more, since God is provident and acts with foresight, He knows all the consequences that would follow upon all possible antecedents. Then, through God’s volitional knowledge, He knows “*p*” (because He has chosen “*p*” from among a number of possible antecedents) from which “*q*” conditionally or contingently results. Freddoso gives a helpful example to describe the situation explained above: “By His natural knowledge God knows that it is metaphysically possible but not metaphysically necessary that Adam will sin if placed in the garden; by His free knowledge He knows that Adam will in fact be placed in the garden and will in fact sin. What He knows by His middle knowledge, on the other hand is something stronger than the former but weaker than the latter, namely, that Adam will sin on the occasion that he be placed in the garden” (Freddoso 1988, 47). Thus, with respect to the difference between “efficacious” and “sufficient” grace, on Molina’s

account, one sees that God knows what set of circumstances would result in a moral agent's freely choosing to act in one way or another (ibid., 66). Thus, God foreknows what circumstances would result in a moral agent's acting for the good or those circumstances in which he would act contrary to what is good; that is to say, God knows in what circumstances His grace would be efficacious and in what circumstances it would remain merely sufficient.

Eventually, the *Congregatio de Auxiliis* condemned Molina's work, but Clement VIII was not pleased with the hasty manner in which the commission's conclusions were reached. When the congregation considered the matter again but with haste, in 1599 Clement ordered that theologians from both religious orders present their arguments in his presence in a series of conferences (Solana 1940, 403–404). The first debate occurred in the pope's presence on 20 March 1602 (Vansteenberghe 1929, col. 2159). A series of debates, some 67 in total, occurred between 1602 and 1605 (ibid., col. 2126) in which the Dominicans, especially Diego Alvarez y Tomás de Lemos, attacked Molina's position and the Jesuits, namely, Gregory of Valencia, Pedro de Arrúbal, and Fernando de la Bastida, defended their confrere (Solana 1940, 404). By this time, Molina had been dead for a number of years and Clement VIII went to join him, passing into eternity on 5 March 1605. After the brief monthlong reign of Leo XI, Paul V ascended to the papal throne and it fell to him to put an end to the controversy. Finally, on 28 August 1607, nearly 20 years after Molina's first publication of the *Concordia*, Paul V concluded the commission set up to resolve the thorny question (Solana 1940, 405). No resolution was reached in terms of who held the authentic Catholic position on grace and free will and who held a heretical view for, according to Paul, both Dominicans and Jesuits were in perfect accord with Catholic teaching. In essence, there could be no resolution because there was no conflict with orthodoxy. Each religious order could maintain its own proper teaching, and Paul insisted that neither should accuse the other of heresy (Denzinger 2012).

Commentaria in primam divi Thomae partem

In 1592 Molina published a commentary on the first part of Thomas's *Summa theologiae*. Like other commentaries on the *Summa* from this time, Molina's commentary offers an analysis of each article but also takes the occasion to include his *Concordia* in the salient sections of the commentary, namely, in the midst of his commentary on question 14. Yet, what constitutes a unique element of Molina's own thought is, as some have pointed out, his understanding of the relationship between "personhood" and "nature" (Solana 1940, 419).

Insofar as a significant element is Thomas's account of the Trinity in the *prima pars* which is the notion of personhood or, as Thomas puts it, three subsistent relations within the single nature and being of the Godhead, it is not surprising that Molina would have the occasion to develop his own ideas in this context. The question he asks, one raised by a number of other scholastics, especially within the Dominican tradition, is whether or not "person" adds anything to, or over and above, nature. Both Capreolus (*Defensiones*, d. 5, q. 3, a. 3, ad 1) and Cajetan (cf. *In ST III*, q. 4, a. 2, II) had insisted that personhood did in fact add an incommunicable element over nature and that this was simply Thomas's own teaching on the matter too. These Thomists stood in opposition to others, such as Bonaventure and Durandus, who maintained that nature and personhood were actually identical but only rationally distinct (Solana 1940, 419). For Molina, "person" formally and concretely signifies a rational nature precisely as incommunicable. The Jesuit argues that this is simply what Boethius and Richard of St. Victor – whom he regards as authoritative in this matter – had maintained in their own definitions of person. Boethius, Molina notes, holds that a person "is an individual substance of a rational nature," and Richard explains that a person "is a rational nature of incommunicable existence." These two definitions amount to the same thing for Molina, since, as he says, Boethius understands by "substance" simply that which is incommunicable (*In prim.*, q. 29, d. 1; fols. 447–48). But since incommunicability, on Molina's reckoning, is a negation insofar as it

pertains to something's indivision from itself but division from others, one may say that it is not so much that "person" "adds" something, as the Thomists were wont to say, but that it is a negation or denial of dividedness or communicability (Solana 1940, 420), for, according to the Jesuit, hypostasis or subsistence is a "certain kind of negation" (ibid.). Molina further adds that "person," as it is said of human, angelic, and divine beings, properly signifies something subsisting incommunicably and also that by which it is distinct from other persons that may share an identical nature (*In prim.*, q. 29, d. 2; fol. 448). With respect to the Godhead, Molina seems to follow Thomas's claim that "person" formally signifies a relation in virtue of which each subsists incommunicably and also obliquely signifies the divine essence itself (ibid.; fol. 449).

De iustitia et iure

Molina's political thought is found most explicitly in his *De iustitia et iure*, a vast work of several volumes, many of which were published posthumously. In all, the work runs through six volumes – at least six were originally projected; Molina died before the final volume could be completed (Solana 1940, 423). The first volume (published in 1593) deals with justice in general as well as its parts; the second volume (published in 1597) explores commutative justice in relation to extrinsic goods, whereas the third volume (published in 1600) deals with commutative justice in relation to bodily goods and persons who are related to one another. The remaining posthumous treat spiritual goods, including honor and fame (fourth volume), and justice and its exercise by the public authority (fifth volume) (Solana 1940, 422–23).

In many ways, owing to its scope, contents, and meticulous attention to the details of various arguments and their implications, Molina's *De iustitia et iure* seems to be parallel to Suárez's *De legibus ac deo legislatore*. Some have argued that the moral reasoning contained in the *De iustitia et iure* develops in a manner somewhat different from that of Thomas Aquinas as well as contemporary theories, such that the work "is neither medieval, nor modern" (Alonso-Lasheras 2011, 53). In discussing the nature of justice in general in the opening volume of his *De iustitia et*

iure, Molina explains that justice has a twofold – but interrelated – meaning as we know from Aristotle (*Nicomachean Ethics*, book 5) and Thomas Aquinas (*Summa theologiae* II–II, q. 58, aa. 5, 6). The first sense of justice, says Molina, pertains to any act of virtue not insofar as it is this or that virtue, but simply insofar as it is ordained to the common good of many to which that virtuous action pertains as a part (*De iust.*, I, disp. 1; fol. 2). Or justice can also pertain to that which emanates from man, not insofar as he is a certain single person, but insofar as he is a part of a republic toward the total good of which one's actions are optimally directed (ibid.). Additionally, Molina holds that justice is likened to and also must ultimately be referred to charity, for although it is a particular virtue, through charity, the just man refers all of his actions to God, on account of which charity has a universal character. Likewise, though justice is a particular virtue, it refers to all of one's actions for the common good of the republic (ibid.). When it comes to law (*ius*), Molina, like Suárez (*De leg.*, 1.2), defines it relative to justice as its object since "when a *habitus*, act, and power are defined it is through their [proper] object" (*De iust.*, I, disp. 2; fol. 4). Thus, because law (*ius*) has as its object justice, Molina disagrees with Ulpianus and Soto who suggest that justice is so-called (*iustitia-ius*) on account of its being derived from law, and maintains, instead, that law stems from justice (ibid.).

Having mentioned "law," Molina goes into further detail and notes divisions of various kinds of law: natural, positive, canon, and civil (ibid., I, disp. 3; fol. 5). Interestingly, Molina holds that the natural and positive laws divide divine law as the latter's subsets. God is the author of nature which He has "optimally and maximally" instituted. That recognition of the natural order (i.e., the "natural law") is "impressed upon our minds," says the Jesuit, whereby one can discern good from evil in evaluating one's own experience (ibid.). In sum, as Molina sees it, law (*ius*) is divided as follows: first, it is divided into divine and human. The divine law is then subdivided into natural and positive laws. Human law, which the Jesuit holds is entirely positive, is itself divided into the *ius gentium*, civil law, and canon law (ibid.; fol. 6).

A matter of sore political contention at the time and reaching well back into the late fifteenth century were moral and political issues surrounding the colonization of the New World, especially on the part of Spain and Portugal. The Dominican Francisco de Vitoria had already weighed into the controversy with his *De indis* and *De iure belli*, in which works he came to the basic conclusion that the conquest of the New World and the despoiling of native peoples of their “dominion” by the Europeans were largely immoral. Molina himself had a similar outlook. The Jesuit thought that a loss of dominion could only be had as a punishment deriving from a “just war” (*De iust.*, II, tr. 2, disp. 98). Needless to say, this raises the question, for Molina: what counts as just war, what are its conditions? The Jesuit considers the claim that it is always unlawful for the Christian to wage war (*ibid.*, II, tr. 2, disp. 99; col. 404), but finds that such a position is contrary to what is found in the Christian tradition itself – especially that articulated by Augustine – and that, moreover, there may be occasions in which not to wage war would be a “mortal sin” (*ibid.*; col. 405). Here, Molina has in mind more than simply repelling force with force, that is to say, a defensive war; he also thinks that there is justification for an offensive war (*ibid.*; col. 406).

According to Molina, the first condition for a just war is that it should be waged by one who has the “proper authority” (*ibid.*, II, tr. 2, disp. 100; cols. 409–10). The authority to declare a war justly falls only to a republic, more specifically, the prince who has no superior over himself because of the “self-sufficiency” he possesses (*ibid.*; col. 410). Thus, in the Jesuit’s eyes, those who have jurisdiction over only a part of the republic lack the authority to wage war justly because they can appeal to their superiors to redress any injuries they may have suffered (*ibid.*; col. 411). No such possibility of appeal exists with sovereigns, however, precisely because of their supremacy. According to Molina, those who wage war without proper authority are obliged to make restitution for any injuries suffered (*ibid.*, disp. 101; cols. 413–14). The second condition of a just war is that there be “sufficient cause” for it (*ibid.*, II, tr. 2, disp. 102). Here, Molina has in mind having some sort of injury

inflicted upon a republic or to recover some good that has been wrongfully taken from the republic (*ibid.*; col. 416–17). Furthermore, no war is to be entered rashly or without due consideration. It is necessary that the case for war be carefully weighed by the prince, in consultation with men of prudence, to determine whether the conditions of a just war exist (*ibid.*, disp. 103). Molina then identifies seven particular conditions that may be grounds for a just war as indicated within the scripture itself: (1) when what is owed a prince cannot be attained other than through war, (2) to put down an unlawful rebellion, (3) to redress a notable insult or injury against the prince, (4) to render aid to a republic who has had a war unjustly waged against it, (5) to bring justice to convicted criminals who are being sheltered by another republic, (6) the violation of a significant treaty, and (7) the denial of certain rights accorded by the *ius gentium*, for example, unimpeded travel (*ibid.*, disp. 104; cols. 426–27).

Abstract

Jean Molinet was a remarkably versatile and prolific author, who distinguished himself not only as a court poet and chronicler, but also for his plays, his treatise on poetry, and his clever parodies. Witness to the agony of the once glorious Burgundian dynasty, Molinet came into contact with the great personages and events of what Huizinga called the Autumn of the Middle Ages, which was also the dawn of the Northern European Renaissance.

Biography

The details of Molinet's life can be pieced together from poetic testimony and archival documents, but little is known of his early days. Molinet did his studies in Paris where he earned the diploma of master of arts before serving as secretary of the College of Cardinal Lemoine.

Sometime after 1461 he left Paris and began an itinerant course that eventually led him into the service of the Duke of Burgundy, Philip the Good. Molinet's earliest poetry, from 1463 and following, celebrates the House of Burgundy and thus anticipates, if it does not already confirm, some kind of official position at court. From around 1465 the poet established residence in Valenciennes where he began a literary apprenticeship with Georges Chastellain, the official chronicler of the Burgundian dynasty. Among his early occasional poetry, Molinet composed an elaborate verse epitaph known as the *Throne of Honor* on the occasion of the death of Duke Philip in 1467. When Chastellain died in 1475, Molinet succeeded him as *indiciaire* or official court historian for the reigning duke, Charles the Bold (Devaux 1996; Frieden 2013). Molinet inherited his new post just in time to witness the fall of the House of Burgundy and the triumph of their arch enemy, Louis XI King of France. Upon the death of Charles in the Battle of Nancy in 1477, Molinet passed into the service of Charles' daughter Mary of Burgundy, who then married Maximilian of Austria. Molinet continued his duties as chronicler in their service and eventually in Maximilian's service after Mary fell off her horse and died in 1482. By 1485 Molinet had been named Canon of the church of Notre Dame de la Salle in Valenciennes, and his loyalty earned him a generous pension as well as other emoluments. Succeeding his father Frederick III as Holy Roman Emperor in 1494, Maximilian named his own son Philip the Fair Duke of Burgundy, and Molinet continued his chronicle in the service of the new duke, whose death in 1506 is the last event recorded by Molinet, who only survived his patron by 1 year (Molinet 1935–1937).

Heritage and Tradition

Molinet belongs to the school of French poets known as the *Grands Rhétoriciens* active in Northern France and Burgundy in the late fifteenth and early sixteenth century. His literary accomplishments include his treatise on poetry entitled *l'Art de rhétorique* and his prose adaptation of the medieval *Romance of the Rose*. He is even credited

with having invented the genre of the *pro-
nostication joyeuse*, which parodies the cryptic
anxiety of more serious prophecies (Molinet
1998; Thiry 1997, 119). The *rhétoriciens* con-
ceived of poetry as the second rhetoric, after
prose rhetoric, but they also inherited a conception
of poetry as a form of music, natural music in
contrast to the artificial music of instruments.
Molinet voices both of these ideas in the opening
phrase of his treatise which defines vernacular rhe-
toric, presumably poetry and prose, as a kind of
rhythmic music or music ruled by number and
consonance (Molinet 2015, 219). This definition
evokes the venerable tradition, associated with
Pythagoras, that poetry captures the music of the
spheres and that the poem functions as a micro-
cosm of timeless celestial harmony. Molinet enacts
this theory in his Royal Ballad on Terpander, inven-
tor of the seven-stringed cithara, a poem which
features prominently in his *Art*.

Impact and Legacy

Celebrated by his immediate successors, Jean
Lemaire de Belges and Clément Marot, Molinet
exercised a possible influence on the work of
François Rabelais, author of prognostications and
rhétoriqueur-style poems, before sinking into last-
ing oblivion, from which he was finally rescued by
the editorial efforts of Noël Dupire in the 1930s
(Molinet 1936–1939). Judging Molinet’s verse by
turns banal, illegible, curious, and obscene (Dupire
1932, 142), Dupire left a large scope for the reha-
bilitation of his subject by French literary criticism
of the 1970s working under the spell of structural
linguistics (Zumthor 1978). Perhaps Molinet’s
most creative legacy can be felt in the verbal exper-
imentations, some seemingly lifted directly from
the pages of the *Art de rhétorique*, of OULIPO, a
French acronym for the laboratory of potential
literature cofounded by Raymond Queneau.

Molinism in Renaissance Philosophy

Abstract

Molinism is a theological and philosophical
theory developed during the late sixteenth cen-
tury by Luis de Molina. In particular, Molinism
tries to explain the relation between God’s
foreknowledge and human free will, thanks to
the elaboration of the so-called middle knowl-
edge, by means of which God foreknows what
each man would do in any possible condition,
but conserves the logical possibility of doing
the opposite of what God has foreknown.
Therefore, Molinism promotes a conception
of synchronic contingency according to
which something could logically be or not be
in the same moment in God’s mind before his
voluntary act of creation. This approach should
therefore guarantee the importance of human

free will in the economy of salvation together with God's sovereign decision. However, it was harshly criticized by both the Thomist and the Augustinian-minded Catholic traditions. This entry will first provide a historical introduction, in which attention will be paid to the so-called *De auxiliis* Controversy between the Dominicans and Jesuits concerning the relationship between divine grace and free will. Secondly, it will consider the theoretical premise of Molinism: John Duns Scotus' synchronic contingency and its difference from diachronic contingency. Finally, it will address Molina's development of a threefold conception of divine knowledge, paying particular attention to "middle knowledge," the central notion of Molinism.

Introduction

Molinism is a theological and philosophical theory, developed during the sixteenth century, which takes its name from the Spanish Jesuit Luis de Molina (Cuenca, 1535 – Madrid 1600). In particular, Molinism finds its elaboration in Molina's *De liberi arbitrii cum gratiae donis, divina praescientia, providential, praedestinatione et reprobatione Concordia* [The Compatibility of Free Choice with the Gifts of Grace, Divine Foreknowledge, Providence, Predestination and Reprobation] first published in Lisbon in 1588. As the title of this work already reveals, Molina was proposing a theory capable of including God's foreknowledge, predestination, and human free will together in the economy of salvation. The terms of the question are clear and ancient: if God knows everything, how could men be free in their actions? If He created this world, are human works useful for salvation, or does He simply determine the destiny of each person, whether salvation or damnation? These questions were not original; they had been the concern of Christian theologians beginning at least with the controversy between Augustine and Pelagius in the fourth and fifth centuries. Very briefly, the former stressed God's election, while the latter stressed free will, considering human good

works to be the sole condition for obtaining eternal life. A similar debate was elaborated during the Reformation era between Protestant and Catholic theologians and also between various factions within these groups. On the one hand, Luther affirmed that grace and faith alone save people, while Calvin maintained a doctrine of double predestination, according to which God predestines some men to salvation and others to eternal death (Calvin 1962: III.21.5). In other words, Protestant theologians were disowning the importance of human choice in the economy of salvation. On the other hand, the Tridentine fathers affirmed the necessity of both causes in order to be saved: God's grace, which has ontological priority, and human free will. However, in the decree on justification, issued during the sixth session (Jan. 13, 1547), the Council did not explain the relationship between God's predestination and human actions, leaving Catholic theologians with the difficult task of solving this problem. This led to the constitution of three schools of thought: the Thomist-Bañezian school in Spain; the radical anti-Pelagian Augustinian school in the Spanish Netherlands; and the school of Luis de Molina. The first two schools stressed God's grace, while the third focused more upon human free will. Molinism has its roots in the publication of the *Concordia* in 1588. This text was the beginning of a harsh debate between the Spanish Dominican friars Domingo Bañez (Mondragón, 1527 – Medina del Campo, 1604) and Diego Álvarez (... – Trani, 1635), who maintained a Thomist position concerning grace, and the Jesuits Molina and Francisco Suárez (Granada, 1548 – Lisbon 1617), who elaborated the so-called theory of "middle knowledge." To counter the criticism of Bañez, Molina later attached an appendix to the second edition of his *Concordia*. This debate was not restricted to Spain. A concomitant dispute also occurred in the Spanish Netherlands, with the fiery controversy between Michael de Bay (Meslin-l'Évêque, 1513 – Leuven 1589) and the Flemish Jesuit Leonard Lessius (Brecht, 1554 – Leuven, 1623). To illustrate the harshness of this debate, the former accused the latter of being "semi-Pelagian" (Van Eijl 1994). In 1597, Clement VIII constituted

the *Congregatio de auxiliis* (“Congregation on [Grace’s] aids”) with the intention of resolving this debate and thereby preventing it from producing another fracture within the Church. This was seen as a real danger, since the Dominicans were calling the Jesuits “Pelagians,” and the Jesuits were calling the Dominicans “Calvinists” (Craig 1988: 170). Finally, in 1607, Paul V interrupted this discussion, accepting both views as legitimate and forbidding the opponents to define each other as heretics. Thereafter, Molinism was considered to be a sound Catholic doctrine. However, the differences between both Thomist and Augustinian-minded positions still remained, and the question was left unresolved. The Pope eventually declared that the question would be taken up again “at an opportune time,” but this “opportune” time has yet to arrive (Molina 1988: VIII). Later, Cornelius Jansenius bishop of Ypres (Acquoy, 1585 – Ypres, 1638) tried to solve the question in his *Augustinus*, essentially reasserting the ideas of Michel de Bay, stressing too much God’s grace. His work was posthumously published in 1640, and it was condemned as heretical by the Catholic Church in 1643.

Molina and Scotus

To comprehend Molina’s theory of middle knowledge, it is useful to begin with the distinction between “diachronic contingency” and “synchronic contingency” as drawn by John Duns Scotus (1265/6–1308), since this provides the key theoretical premise of Molina’s theory (Duns Scotus 1994: 24–28). Aristotle considers time as an infinite dimension: it has no beginning or end. Moreover, he maintains the principles of identity and noncontradiction. Two consequences follow from these positions: (1) Something could not “be” and at the same time “not be.” For instance, at the moment $t1$ it could be a or $-a$, but not a and $-a$ together. (2) Thanks to change and to the infinity of the time, every potency will be actualized. This is referred to as “diachronic contingency,” since any potency is actualized through time, by means of change. However, John Duns Scotus conceived of another model, defined as

“synchronic contingency,” which distinguishes between logical possibility and factual reality. In short, when something exists, the logical possibility of the existence of its opposite in the same moment is conserved. This is taken to be “an irreducible ontological quality of the things themselves” (Duns Scotus 1994: 30). Recalling the previous example, if a thing is a at moment $t1$, it could also have been $-a$. Applying this principle to theology, we could say that by means of his creation, God actualizes a particular potency, but what is created still maintains the logical possibility of being opposite to itself. Therefore, the factual world that was created is just one of many possible worlds, and this factual world might even have never been created. Therefore, according to Scotus, though God’s knowledge is determinate, immutable, and infallible, it does not limit the logical possibility of something either being or not being. Molina “show[s] some familiarity with Scotus’ innovative theory of synchronic contingency,” but he seems not to have “managed to incorporate the metaphysical framework belonging to the theory” (Dekker 1995: 453). In any case, the Spanish Jesuit maintains a view similar to that of Scotus; for instance, he affirms that two opposite propositions are not contradictory when thought in eternity, although in time they could be true only at different times (Molina 1595: q. 48, 204–205). Moreover, Molina maintained that eternity does not include the future, since the future has yet to come (Craig 1988: 172). Therefore, God’s foreknowledge of the future is contingent, precisely because the future does not exist, and on Molina’s account “when things are produced in time, they are simultaneously produced in eternity; therefore, things cannot exist in eternity before they exist in time” (Craig 1988: 171).

Molina and “Middle Knowledge”

The problem is, therefore, declared: if God knows human acts from eternity, how could man be free in his choice and responsible for his actions, considering that God first knows and only then creates the world? To stress the importance of

human acts, Molina had to find a way to conserve human free will, despite God's foreknowledge. Therefore, he focused on foreknowledge for elaborating a short "oasis" in God's knowledge that could allow men to be free in their voluntary acts. This oasis is the so-called middle knowledge. As the Spanish Jesuit explains in his *Concordia*, God has a threefold knowledge (*scientia*): natural, middle, and free. These three different orders of knowledge are acts of the intellect anterior to creation, and therefore they are from all eternity. In other words, they are not to be thought as chronologically ordered. Rather, they are logically ordered, beginning with knowledge of wide focus – "natural knowledge" – to a more restricted knowledge – "free knowledge." Between these two, Molina inserts the "middle knowledge," aimed precisely at conserving human free will (Gerace 2016). More specifically:

1. "Natural knowledge" (*scientia naturalis*) is that through which God knows all potencies, both those that will be actualized and those that will remain in potency. So natural knowledge is addressed to all logical possibilities, independently of their future necessity (as with the laws of nature) or future contingency (as with human actions). This knowledge is natural since it is anterior to any act of God's will, prior to any intervention of his will into acts of choosing what should be created or not. Technically, it is said to be "pre-volitional," and it is somehow constitutive of God's own being (Molina 1988: 47).
2. "Middle knowledge" (*scientia media*) is foreknowledge of future contingents. It logically follows natural knowledge, having a more restricted object of focus. In fact, by means of it, God does not know all potencies. He has certain foreknowledge only of those events that would actually occur in the future, even though their existence is not necessary. It is directed not toward potencies *simpliciter*, but only toward those potencies that would be actualized. Also, this knowledge is pre-volitional, since it intervenes prior to any act of God's will. Through it, He knows a particular event, even though He has not (yet) decided

whether He will create it or not or, more accurately, whether He will actualize it or not (Molina 1988: 168). Thanks to middle knowledge, God knows "what each created free agent would do in any situation in which that agent might be placed" (Gaskin 1993: 412–413). However, the agent maintains the logical possibility of acting differently from what God has foreknown because God has not yet created that particular order of things. For instance, God foreknows that *A* would freely do act *x*, but *A* still conserves the freedom to do $\neg x$.

3. "Free knowledge" (*scientia libera*) is knowledge of "all *actual* or *absolute* future contingents" (Molina 1988: 47). This knowledge has a more restricted focus than the middle knowledge, being centered only on those potencies that *will* (not *would*) be actualized. This knowledge is free precisely because it depends only on God's voluntary act of choice, without external conditioning. Thus, "free knowledge" logically follows the voluntary act of actualizing (or not actualizing) a particular potency. In contrast with "natural knowledge" and "middle knowledge," "free knowledge" is post-volitional. In any case, the prefixes *pre* and *post* are not to be understood chronologically, but logically.

In sum, in a logical – not in a temporal – order, God (a) knows all possible potencies through his "natural knowledge"; (b) foreknows those potencies that *would* be actualized, even though they would also be differently actualized, through his "middle knowledge"; and (c) knows the potencies that *will* be actualized with his "free knowledge," after having decided which potency has to be created.

Abstract

The English word “monster” encapsulates a variety of distinct prodigious, medical, and natural phenomena. Prodigious, portentous, or miraculous monsters could provide the people of Europe with evidence of God’s will, warning, or wrath, when read emblematically by a contemporary expert. Monstrous births (physically abnormal humans and animals born to anatomically normal parents) might be interpreted as evidence of God’s ineffable variety or Nature’s mistakes or alternately in a political vein. If an entire human society were composed of such unusual individuals, all of whom shared the same physical or behavioral abnormality, they would constitute one of the monstrous peoples who lived far beyond the margins of civilized society. Similarly, fabulous beasts such as unicorns, griffins, dragons, and sea monsters were believed to populate the far ends of the earth and were interpreted as both warnings of the dangers of the unknown and representations of actual living animals. Monsters were reproduced in a variety of media, from lavishly illustrated maps and manuscript bestiaries, to Latin medical and wonder treatises, to cheaply printed pamphlets and broadsides in the vernacular. Despite their differences, such works repeated the same examples, often accompanied by the same woodcut illustrations; indeed, once printed in either Latin or the vernacular, a book about monsters

was likely to be both translated and reprinted in multiple editions.

Heritage and Rupture with the Tradition

The English word “monster” developed out of the French “mostre” or Latin “monstrum” (a portent, prodigy, or monstrous creature) and the Latin “monere” (to warn) and encapsulated a variety of distinct prodigious, medical, and natural phenomena, with considerable overlap between the categories.

Prodigious, portentous, or miraculous monsters could provide the people of Europe with evidence of God’s will, warning, or wrath, when read emblematically by a contemporary expert. The quintessential examples of this type are the Papal Ass (a strange creature that washed up on the banks of the Tiber in Rome in 1496) and the Monk Calf (a deformed cow born in Freiberg in 1522). Polemically analyzed in a pamphlet by Philipp Melanchthon and Martin Luther, this pair of monsters was read as signs of God’s judgment against the Catholic Church (Melanchthon and Luther 1523); for example, the calf’s apparent cowl (a large flap of skin behind its neck) was interpreted as signifying the stubbornness of monks (Spinks 2009, 59–79).

In a broader context, monsters such as the deformed Monk Calf fit into the medical category of monstrous births: physically abnormal humans and animals born to anatomically normal parents. From conjoined twins to headless infants to apparent human-animal hybrids, these unusual creatures were interpreted as evidence of God’s ineffable variety or Nature’s mistakes or alternately in a prodigious vein. Such monsters could also be read politically, as when, during the English Civil War, a woman criticized the Parliamentary Roundheads and subsequently gave birth to a headless infant (noticeably lacking a round head); this occurrence was interpreted in a

Parliamentarian pamphlet as testimony of God’s displeasure against the woman’s political views (Crawford 2005, 134–144).

If an entire human society were composed of such unusual individuals, all of whom shared the same physical or behavioral abnormality, they would constitute one of the monstrous peoples. Believed to live beyond the margins of civilized society (generally in the Far East or Africa but after 1492 in the New World, as well), these peoples owed their medieval and Renaissance survival to the Greco-Roman tradition and specifically to Pliny the Elder’s *Natural History* (first century CE). Some of the most recognizable monstrous peoples include the cynocephalic or dog-headed people who bark instead of talking and by some accounts practice cannibalism, the applesmellers who have no mouths and survive on pleasant smells (though strong odors will kill them), and abnormally short pygmies who wage perpetual war on the cranes that threaten to overrun their land (Friedman 2000, 9–21).

Similarly, fabulous beasts such as unicorns, griffins, dragons, and sea monsters were believed to populate the far ends of the earth and only occasionally come into contact with humans. Depicted on lavish maps such as Olaus Magnus’s 1539 *Carta Marina*, these creatures were interpreted as both warnings of the dangers of the unknown and representations of actual living animals (Nigg 2013, 8). Periodic cases of whales or giant squid washing up on Europe’s beaches, occasional disappearances of trading and exploratory vessels, and even taxidermy creations such as Fiji mermaids (fish tails sewn onto monkey torsos, an eighteenth-century example of which survives in the British Museum’s Enlightenment Gallery) provided concrete evidence of such marine monsters.

Impact and Legacy

Europe’s populace learned about monsters through a variety of media, from lavish (and expensive) illustrated maps and manuscript bestiaries, to Latin medical and wonder treatises such as those of Conrad Lycosthenes (1557) and Pierre Boaistuau (1560), to cheaply printed pamphlets

and broadsides in the vernacular. Despite their differences, such works repeated the same examples, often accompanied by the same woodcut illustrations (Daston and Park 2001, 191), and so socioeconomic status did not drastically affect knowledge about the monstrous. Nor was printing about monsters regionally limited, as such works were published throughout both Catholic and Protestant regions; indeed, once printed in either Latin or the vernacular, a book about monsters was likely to be both translated and reprinted in multiple editions.

Abstract

At the end of the Renaissance, during the multifaceted and tragic sixteenth century, a delicate historical moment for France and Europe, Michel de Montaigne and his major work, the *Essays*, had enormous importance, both for their contemporaries and for their legacy in European culture. Montaigne's thought was rooted in a specific context, but the mirror of the *Essays* was able to elaborate and transform its background in an original way: the result is a true *livre de chevet*, an essential masterpiece for understanding the development of our culture in various fields of knowledge. The French philosopher spent his life mainly in France, with the important exception of a long journey in different countries, among which Italy was especially relevant. Between political activity, the claim of his nobility, and the careful portrait as an erudite person, Montaigne's life shows the complexity of a century during which the European identity developed. Herein lies the

difficulty in portraying a single picture of this personality. The images of Montaigne changed throughout the following centuries and even today we can easily observe a plurality of interpretations; this diversity is related to the different elements chosen by scholars as key aspects in reading his work. Of course, the variety of interpretations is due to the wealth of the *Essays*, a classic of our literature and our philosophy, but it is produced also by the tangle of autobiographical purposes and accurate creations of the idea of the *homme accompli*. The human being that emerges from the pages of Montaigne is an innovative interpretation of Renaissance heritage, a transformation of the lesson of the *Cortegiano* by Baldassarre Castiglione (1528) fraught with the anxiety caused by the end of the previous humanistic faith in a new age grounded in the rebirth of an ancient legacy. In the treasure chest of Montaigne's work, we see the presence of relevant topics of the Renaissance proposed in French, in search of a new manner of expression between *sprezzatura*, refined culture, and political grasp.

Biography

Michel Eyquem de Montaigne was born in Saint-Michel-de-Montaigne in the Montaigne Family Chateau (Bordeaux) on February 28, 1533, and died in Saint-Michel-de-Montaigne in the Montaigne Family Chateau (Bordeaux) on September 13, 1592. Following the common usage among the French aristocracy, his family stored his heart in the church of Saint-Michel de Montaigne and buried his body in Bordeaux.

During the sixteenth century, France was a country through which humanistic culture, fully matured in Italy, spread building new ways of thinking and new institutions. Among the latter, it is important to remember the Collège royal

(1530), the first name of the Collège de France, founded by Francis I (François d'Orléans, Comte d'Angoulême, Cognac 1494–Rambouillet 1547), and with the important contribution of Guillaume Budé (1468–1540), a scholar who brought about a revival of classical studies, thanks to a strong collaboration with his King attested also by the Preface of *Commentarii linguae graecae* (1529). This new institution is a perfect example of a culture which wants to differentiate itself from the previous ones: Scholasticism and one of its most important institutions, the Sorbonne University. The Collège royal was created for cultivating branches of knowledge which were secondary in the university framework; among these disciplines, a special position was acquired by Greek, Hebrew, and other oriental languages. This choice was rooted in the new attention given to philology as a critical tool for reading texts and Scripture. The growing importance of philology was clear evidence of the influence of Italian culture and, particularly, of authors such as Lorenzo Valla (1407–1457) and Agnolo Poliziano (1454–1494). Before the birth of Michel de Montaigne, Italy was the center of a new approach to life and culture, the true crossroads of different traditions, and, with its numerous cities (Burke 1998), the hub from which many voices of Humanism spread Renaissance' thought through Europe.

The importance of Florence, Padua, Venice – with Aldo Manuzio – and Rome, among other places, for the history of Europe is closely linked to a tragic moment for the Italian peninsula, the period of the Italian Wars (1494–1559). During these decades, under the kingdoms of Charles VIII, Louis XII, and Francis I, France fought important battles for the conquest of different cities: the Battle of Marignano (1516) and the following peace, the Treaty of Cambrai (1529), and the Peace of Cateau-Cambrésis (1559) were significant events in this troubled period, when, after the beginning of the sixteenth century, France and Europe were undergoing the crisis of Western Christianity. The Lutheran Reformation (1517) and the response by the Catholic Church with a Counter-Reformation, initiated by the Council of Trent in 1545, formed a traumatic

rupture in the history of Europe, which had important consequences for Michel de Montaigne's biography (Desan 2014).

The relevance of this philosopher to our tradition is clearly shown by the rich bibliography devoted to him and to his thought: over the centuries, Montaigne's image has changed, following the various interpretations offered by his readers. Among the most famous ones, we may recall that he has been portrayed as one of the most refined authors of French literature, near to the Pléiade (Joachim du Bellay, 1522–1560; Jacques Peletier du Mans, 1517–1582; Remy Belleau, 1528–1577, and Pierre de Ronsard, 1524–1588); the heir to the great Humanists, such as Desiderius Erasmus of Rotterdam (1467–1536); the father of the rebirth of skepticism in Early Modernity; a successor of François Rabelais (1493/4–1553) as the desecrating writer against the dogmatism of the Sorbonne University; an elegant political thinker, like Etienne de La Boétie (1530–1563) and Jean Bodin (1529–1596); or one of the initiators of the Libertine approach to life and tradition. This complexity is not derived from the plurality of interpretations only but is rooted in the very architecture of his book, the *Essays*. We will highlight only some of these evocative images, but it is really important to be aware of the changing profile of Michel de Montaigne, especially because, in the presentation of his biography and in a brief illustration of his thought, we will use different interpretations, often in conflict one with another.

Michel's biography is really important for an understanding of his book for two significant reasons: (1) the presence of frequent references to well-known events of his time in the pages of the *Essays*; (2) right from the introductory letter *Au lecteur*, Montaigne highlights that "Thus gentle Reader my selfe am the ground worke of my booke" (Montaigne 1603), a sentence rich in meaning which does not refer only to mere actions in public life but also involves the author's own thoughts. The history of Michel de Montaigne's family is a good representation of the tensions and ambitions harbored by the "new" French aristocracy: his great-grandfather, Ramon Eyquem (1402–1478), was a bourgeois in the salted fish and wine trades; during his life, he had increased

the family's wealth, accumulating land and properties, among which the noble houses of Montaigne and Belbeys in the barony of Montravel, acquired at the end of his life, in 1477. These purchases made it possible for him to change the family name from Eyquem to Montaigne. Michel's grandfather was Grimon, born around 1450, the eldest son of the marriage between Ramon and Isabeau de Ferraigues, and heir, with his brother, to great wealth; between business and responsibilities in Bordeaux's civic life as *jurat*, juror (1490), and provost of Bordeaux (1503), Grimon married Jeanne Dufour in 1490: they had three daughters and five sons, the eldest of whom was Pierre Eyquem de Montaigne, Michel's father, born on September 20, 1495. The transition from the bourgeoisie to nobility was made by Grimon over the next 20 years, but the change was completely accomplished by Pierre Eyquem, who embraced the military profession and took part in the Italian Wars as an archer in the company of Odet de Foix (1515). After Grimon's death, his estate was split up, and the noble house of Montaigne was given to Pierre. His marriage (January 15, 1529) to Antoinette de Louppes is a complex balance between the aspirations of the two families involved. Antoinette was the daughter of Pierre de Louppes of Toulouse and probably the niece of Antoine de Louppes de Villeneuve, a Spanish merchant. Her father belonged to the Bordeaux bourgeoisie, but it is possible that the origins of the family were rooted among the Jews converted to Christianity, the *Marranos*, or new Christians. The marriage to Pierre Eyquem was an opportunity to link the newfound wealth of Antoninette's family to the new nobility of a man who had recently achieved military glory. Like his father, Pierre Eyquem was a *jurat* and provost of Bordeaux (1530) but was now in possession of a noble title. He lived in the Montaignes' castle, without forgetting his obligations to civic life and offering hospitality to scholars and strangers during their journeys in the region; in 1536, he was elected deputy mayor, *sous-maire* of Bordeaux. His first surviving child – two previous children died in infancy – was Michel Eyquem de Montaigne: from this moment, we have different documents and, as is

well known, some information given by Michel himself, who wrote many fragments of his life in the *Essays*. After Michel, Thomas (1534–1602), Pierre (1535–1595), Jeanne (1536–1597), Arnaud (1541–1569), and Marie (1555–1580) were born to Pierre and Antoinette.

Michel's life started in the most traditional way, but his father chose to educate him according to the rules of humanism to model him as a noble and ensure the transformation of the family. It is suggestive that the year of Michel's birth is also that of the foundation of the Guyenne Collège, until 1534 under the direction of Jean de Tartas, when André Gouvea took on that role. After a first period of about 2 years with a wet nurse in Papessus, a village near Bordeaux, Michel returned to the family's noble house, where his father established an important rule: the native tongue of Michel was to be Latin. His first tutor, Horstanus, was German without any competence in French; in his work, the boy was helped by other tutors, among whom were Guillaume Guérente and George Buchanan. At 7 years of age, Michel went to Guyenne Collège, where some of his tutors were teachers; he remained in this new institution for 6 years and, during this important experience, he had the opportunity of acting in a version of *Medea* translated into Latin by Buchanan. Between 1542 and 1546, Pierre Bunel was at Montaigne and he gave the boy a copy of *Liber creaturarum sive Theologia naturalis* written by Raymond Sebond. Between 1548 and 1550, Michel was probably in Toulouse studying law, and from 1551 to 1554 in Paris, where he attended the courses given by Adrien Turnèbe and Sylvius (Jacques Dubois). During this period, his father was elected mayor of Bordeaux (1554) and Etienne de La Boétie, after his studies in Orléans, became *conseiller* in the parliament of Bordeaux (1553). In 1534, after the promulgation of the Edict of Fontainebleau, La Boétie probably wrote the second version of *Discours de la servitude volontaire*, addressed to Guillaume de Lur. In the same year, Michel became councilor in the Cour des Aides of Périgueux, and, in 1557, he was enrolled in the Parliament of Bordeaux, where, in 1558, he met La Boétie.

The growing importance of political commitment in Michel's life is a characteristic of these years: in 1559, he went to Paris, to the Court, where he also returned the following year until 1563; in October of the same year, he followed the royal army to Rouen, where he met the three natives from Brazil, an experience narrated in the famous chapter *Des cannibales* (I, xxxi). In the next few years, Michel did different activities in the Parliament in Paris, also against the venality of public offices. The same period saw the end of certain unrest in Bordeaux: the mayor and the *jurats* of this city regained their full political powers. These civil affairs did not interrupt his intellectual activities: in 1565, after some important reading, including the *De rerum natura* by Lucretius (1564), he started the translation of *Theologia naturalis*, a work requested by his father, who was to die on June 18, 1568. Michel thus became *Seigneur de Montaigne*. In 1553, La Boétie died, and, bearing witness to their strong friendship, Michel took on the responsibility for part of his works and library; he published some of these works in 1570 for the publisher Frédéric Morel, in Paris. A year previously, again in Paris, Michel had completed the most classical part of his training as a humanist with a translation from Latin into French of the book *Theologie naturelle de Raymond Sebond docteur excellent entre les modernes*, published by Gilles Gourbin, Guillaume Chaudière, and Michel Sonnius. This is the framework of Montaigne's famous *retraite*, the retreat which started on June 21, 1571, a day marked by an inscription testifying to his wish to remain "dans le sein des doctes vierges," "retired to the bosom of the learned Virgins" (Legros 2000): from this moment, an important part of his life would be devoted to his book, the *Essays*. The original inscription in the *cabinet* is in Latin; an adaptation in French is present in chapter VIII of book I, a chapter often identified as a previous introduction of the *Essais*. In the same year, his first daughter, Léonor, was born from his marriage to Françoise de la Chassaigne (1565). On October 18, less than 2 years after ending his career as a magistrate, Montaigne received a letter from Charles IX granting him the extraordinary honor of being named a Knight of the Order of Saint

Michael. 1572 was the year of the St. Bartholomew's Day massacre, an event that marked the history of the French Renaissance and of Michel's thought, but it was also the year of the publication of the *Parallel Lives* by Plutarch in the French translation by Jacques Amyot. Michel's retreat was interrupted several times by his duty as a politician, especially when the religious conflict against the Huguenots involved Bordeaux, and also in 1577 for the negotiations between the Duke of Montpensier and the Parliament of Bordeaux. In November of the same year, probably thanks to the intervention of the Foix family, Montaigne was appointed a gentleman of the chamber of King Henry of Navarre.

Two years later, in 1579, Montaigne obtained the *privilege de Roy* for his *Essays*: in 1580, in Bordeaux for Simon Millanges, the book was published in two volumes and many chapters, and with the letter *Au lecteur* dated March 1; after three months, on June 22, the author left Bordeaux for Paris and in July his book was given to Henry III. From this moment, Montaigne's biography is interwoven with the editorial adventures of his book: during the next 13 years the author was to work on it constantly and many experiences were to appear in the pages of the *Essays*. In September, with his brother Bertrand, his brother-in-law Bertrand de Cazalis, Charles de Madaillan d'Estissac, and Georges du Hautoy, Montaigne started the journey chronicled in his diary, the *Journal* (XXXXX), through Baden and Hall, near Innsbruck, to arrive in Bolzano on October 28, 1580, from where the journey into Italy began. At the end of November, he was in Rome, having spent some days in Ferrara welcomed by the Duke Alfonso II d'Este. During this leg of the journey, Montaigne met le Tasse, already interned in the Sant'Anna hospital. Montaigne stayed in Rome for several months, and on April 3, 1582, he received the papal edict which granted him citizenship as a Gentleman of Rome. In order to understand certain changes in the *Essays*, it is important to remember that as required by the Rome Customs, Montaigne left his book for an analysis by the Catholic Church authority, and only on March 20, 1581, did the Maestro del Sacro Palazzo, Sisto Fabbri, give him

back the *Essays* and some detailed notes for emending it. Due to a kidney stone problem, he visited towns well known for their thermal waters such as Lucca; during this journey, Montaigne received a letter from Tausin with news of his election as mayor of Bordeaux. After a second stay in Rome, on December 30, 1581, Montaigne, therefore, returned to his hometown to take up his new political role.

In 1582, there was the second edition of the *Essays*; there are few changes, but the journey in Italy had had some consequences: the addition of citations from *La Gerusalemme liberata* and a critical reception of the remarks made by the Roman Censors. Two years passed, during which his name became well known among the members of the *Respublica litteraria*, and he was re-elected as mayor of Bordeaux. During this period, Montaigne welcomed the King of Navarre as a guest in his castle. Regarding the increasing fame of the *Essays*, we have some important hints: letters from other philosophers, among whom Justus Lipsius (1583), the first projects for their translation, for example in Holland (1585), and the hospitality in his castle offered to many philosophers, such as Pierre Charron (1586). 1588 was a really important year: we know that his intellectual friendship with Marie Le Jars de Gournay, his "fille d'alliance," started that winter, and in June came the publication of a new edition of the *Essays*, in Paris for Abel L'Angelier. This new edition presents relevant novelties: first of all, a new third volume was added; but also the first and second volumes underwent complex rewriting with about six hundred additions. During the summer, Montaigne was the guest of Marie de Gournay, who, after his visit, wrote *Proumenoir de M. de Montaigne* (1588), recalling their walks together. In 1589, after the assassination of Henry III, Henry of Navarre was acclaimed as his legitimate successor. On November 30, the new King called Montaigne to his service. Michel, however, was sick and, while proclaiming his loyalty, remained at his castle. At the end of 1591, the first Italian translation of the *Essays* by Girolamo Naselli was published in Ferrara for Mamarello; this translation was of the 1567 edition, before the addition of the third book. On September

12, 1592, after a long illness, Montaigne passed away. It is important to remember that Abel l'Angelier, the publisher of the 1588 edition of the *Essays* possessed the rights (*privilège*) on the book for 9 years. After Montaigne's death, two counterfeited editions were published, but, meanwhile, Marie de Gournay received a 1588 copy with a wealth of notes by the author from Montaigne's family. In 1595, again for Abel l'Angelier, de Gournay realized a new edition with numerous additions: the length of the book increased by one third. In the next few years, it was this edition that spread through Europe, thanks to relations between Marie de Gournay and Justus Lipsius, to whom she gave a copy. Five different editions had been published by Abel l'Angelier by 1604: the first three were realized with the collaboration of de Gournay who wrote two different prefaces (1595 and 1598). In 1603, the first English translation by John Florio appeared in London for E. Blount. In 1635, a new edition was published in Paris by Jean Camusat, under the patronage of Cardinal de Richelieu, and was dedicated to Marie de Gournay.

Heritage and Rupture with the Tradition and Innovative and Original Aspects

The *Essays* is a fascinating labyrinth: the reader is left to find his own way on a personal journey through Montaigne's legacy, tasting the flavor of the novelties he offers. In Stefan Zweig's beautiful and tragic biography (Zweig 1960), Montaigne is described as a writer who discloses his complexity only to a mature reader, a reader aware of life's uncertainties yet not disillusioned. This recommendation is a good entry point to navigate the "work in progress" realized by Montaigne, an architecture that is also a conceptual choice for shaping his cultural proposal. The sources of the *Essays* were rooted in the classical Greek and Latin heritage and in the more recent humanistic tradition. A first important reference to get an idea of the wealth of references deployed in the pages of the book is the work by Pierre Villey (1908). This relevant contribution to the studies on Montaigne has been the constant reference for over a

century; nowadays, some assumptions and results are questioned by scholars, but the two parts of Villey's works, the first focused on the *Essays*' sources and chronology and the second on the evolution of the book, remain a benchmark in the historiography of the field. The *Essays* are structured in three books with chapters of different lengths: the first book has 57 chapters; the second, 38; and the third, 13. Generally speaking, the third book is notable for its lengthier chapters, but the longest chapter of all is the 12th of the first book: the *Apology for Raymond Sebond*. This is a true "book within the book," where Montaigne does battle with the dogmatic approach to knowledge and to the human being. Sebond's book, which he translated in 1569, is more than a pretext for a treatise on the skepticism which embraces every aspect of reality: presenting a history of this philosophical approach, Montaigne defines his position and his criticism. In appearance, the *Essays* are in the framework of the Renaissance treatises: almost every page is enriched with classical or coeval citations or references. In this sense, it is easy to think of them as a charming florilegium with erudite comments by Montaigne. Of course, this image is insufficient to grasp the originality of Montaigne's masterpiece. If the general approach is in line with that elaborated by the Renaissance moralists, an approach also justified by the subjects discussed, the singularity of the author sets his unprecedented stamp on the entire book. The relation with tradition is a key theme for the whole of Early Modernity, therefore it is hardly surprising that it is a central topic in the *Essays* too, a book that never ceases to question itself and its author.

Because of his erudition and the structure of his book, Montaigne was aware that he ran the risk of seeming a "writer of books," but he stressed that: "Je suis moins faiseur de livres que de nulle autre besogne" (I, xxxvii): the supremacy of life over a pedantic culture and the identity of *gentilhomme* are aspects embedded in different chapters of the *Essays* and are useful for understanding the novel features of the book. Montaigne disseminated his thoughts about tradition in two different groups of chapters: the first one directly regards his relations with books; the second one, more fragmentary, is

devoted to the approach to heritage and writing, involving the creation of the *Essais* themselves. In the first group, we find chapter x of Book II, *Des livres, On books*, and chapter III of Book III, *Des trois commerces, On Three Kinds of Social Inter-course*: books are ammunition for facing the uncertainty of life and company in loneliness during necessary *otium* and in old age, when the vigor of the body is weaker. In the second group, we find chapters not directly linked to the issue by their titles or by their main topics: *Du pédantisme* (I, xxv), *De l'institution des enfants* (I, xxvi), and *De la ressemblance des enfants aux pères* (I, xxxvii): in these chapters, Montaigne describes his approach to writing and some characteristics of his book. Here, the fracture with previous traditions is noticeable, and there is an original elaboration of some aspects contained in Italian and European humanism: the book is compared to a son, a testimony of the singularity of its author who exists thanks to the book itself. The *authoritas* of the classical tradition and philological tools are now used to create a personal approach to reality, to express the changing positions of the author. This framework rejects any dogmatic method and proposes a critical examination of the sources utilized for "saying" his own position: Montaigne creates many cross-references between himself, the book, and his educational proposals, in order to establish a true mirror where we can easily see the exercise of judgment. The role of doubt is crucial: the choice between the different positions analyzed is not forced: his reader, the pupils, the author can suspend their judgment, because: "Il n'y a que le fols certains et résolus non men che saper dubbiar m'aggrada" (I, xxvi). It is important to stress that this attitude towards doubt is a major key of the *Essais*, because the title itself means precisely the exercise of judgment on the living material of life through the subjectivity of the author. The French word *essai*, in fact, is related to the concept of *test*, to explain the manner in which any idea is challenged. Nevertheless, in the book, the classical epoché (ποχή) of skepticism does not have the last say in every context: in the trouble of civic life, to take a stance is a social and ethical responsibility, as stressed many times by Montaigne.

From the interweaving of the critical approach to previous traditions and the role of doubt, it is possible to explain two other relevant aspects of the *Essais*: the centrality of the "distingo" and the transformation of the book over the years. If in the mirror of Montaigne's writing the world and opinions are investigated and the judgments on them follow the different assumptions chosen each time, what is the main approach elected by the author? "*Distingo* est le plus universel membre de ma Logique" (II, i): this statement derives from the urge to find a mode of writing capable of pursuing the changing reality of the world, without preconceptions, to embrace ongoing research and continuous discovery. This approach permeates many chapters and combines skepticism and a profound fascination with the human condition. As is well known, in Montaigne this openness to becoming is often accompanied by ironic detachment, but this *recul*, this critical distancing is a relativization of different points of view and never becomes ostentatious indifference. The idea that the difference between two single elements is far more important than the common traits is a key concept in the *Essais*, not only often detailed but also put into practice thanks to a changing style in writing. And this is the framework to understand the previously mentioned stratification of the book: in the various editions of the *Essais*, the work realized by Montaigne was devoted to a true representation of the changing mobility of his thought. Of course, we can find some "adjustments," but the main direction followed by the author was to maintain the differences between his convictions, differences derived from deductions rooted in dissimilar assumptions, or differences gained over the years thanks to new considerations and new experiences.

Between 1580 and 1588, in the edition that added the third book, and from then on until his death, Montaigne continued to be committed in a conversation with his book, because "Les autres forment l'homme, Je le récite, et en représente un particulier, bien mal formé [. . .] Or les traits de ma peinture ne fourvoient point, quoiqu'ils se changent et diversifient. [. . .] Je ne peins pas l'être. Je peins le passage: Non un passage d'âge en autre, ou comme dit le peuple de sept en sept

ans: mais de jour en jour, de minute en minute. Il faut accommoder mon histoire à l'heure" "Others form man; I only report him: and represent a particular one, ill fashioned enough [...] Now, though the features of my picture alter and change, 'tis not, however, unlike [...] I do not paint the being. I paint its passage; not a passing from one age to another, or, as the people say, from seven to seven years, but from day to day, from minute to minute, I must accommodate my history to the hour" (III, II). These passages are taken from the opening of the chapter *Du repentir*, and they are famous because in them the author consciously clarifies his project; his opinions, like the entire world, are at the mercy of mutation, therefore any nondogmatic writing must follow the movement of its subjects, groping through structural uncertainty to find temporary truths and to adjust the author's behavior. This is one of the reasons why reading and interpreting the *Essais* is so complex and fascinating: in their pages, we observe different portraits of Montaigne: his features change but coexist, giving an idea of *perpetuum mobile*, without losing an overriding consistency within a wider project. Thanks to the writing of this work, the author is involved in the reality that he analyzes, subject and object at once, establishing a pact with the reader, who is required to witness an open process of transformation and refinement. This approach is the answer Montaigne elaborated to face the uncertainty of his time. The overpowering irruption of complexity in every aspect of life and the resulting inadequacy of the strict respect of lessons received from the past, are characteristics already present in the Italian context of the first part of the sixteenth century. If the insufficiency of the moral tradition for an effective grasp of political thought is one of the aspects of Machiavelli's works, in Guicciardini it is easy to see an awareness of the need to test every assumption with the litmus test of experience in a changing world. In the celebrated chapter VI of his *Ricordi*, Guicciardini uses juridical terminology, vocabulary derived from his studies in law – another aspect that links him to Montaigne – to shape the concept of *discrezione*. This idea indicates the potential of judgment rooted in culture's previous teaching

yet capable of analyzing reality: only the experience in the book of the world can refine a judgment so that it can perceive the differences and the exceptions as the only constant in the human condition. This is an attitude that encompasses both knowledge and behavior, finding a precise application in political life; its echoes are present in Italy, in authors such as Giovanni Botero, *Della ragion di stato* (1598), and Traiano Boccalini, *De' ragguagli di Parnaso* (1612), and in France, in Jean Bodin among others. In the *Essais*, the impact of this approach is a powerful one: every aspect of reality is canvassed, from the habits of society to the manners of life in the French colonies, from political alliances to religious precepts, stressing that the author's outlook on this fluctuating world is always that of a humanist. By means of the description of a mobile writing as a tool for his judgment, Montaigne also proposes himself as a knowledgeable gentleman, presenting himself on the French political scene. The intention to captivate the reader's attention by his ability to manage many aspects of the *varietas mundi* is a relevant feature of the rhetoric deployed in the *Essais*. Nevertheless, this inclination for promoting himself as a noble politician is only one aspect, undoubtedly considerable, in the wider mosaic of the book. To propose a judgment with such characteristics is also a statement towards the changing reality of the world, a judgment in which knowledge and political skills are interwoven with an ethical attitude: if dissimilarity is always more significant than similarity, the bet on *discrezione* is the best way to render full dignity to each difference in reality, avoiding any limitation or unification applied as a violent imposition. The fight against dogmatism reveals itself as the more human choice for understanding ourselves and the others and for finding a gyroscope in the ever-changing map of the world.

As we have seen, all these elements are frequently found in the pages of the *Essais* and their importance increases or decreases according to the topic addressed by the author. Among these topics, one plays a significant role in giving a deeper insight into the heritage present throughout the book and the novelties proposed by it: education. When Montaigne started writing the *Essais*,

Renaissance educational thought was already fully developed and the necessary coexistence of a specific culture and a specific educational proposal was assumed as the cornerstone of humanism. The Italian tradition, from Petrarch to Leon Battista Alberti and Enea Silvio Piccolomini, from Poliziano to Baldassare Castiglione, from Giovanni della Casa to Alessandro Piccolomini and Stefano Guazzo, was a necessary reference for the French philosophers. Of course, in the *Essais* we immediately identify the rich contribution from Erasmus, the Prince of humanists and a constant benchmark for Montaigne himself, and François Rabelais. Like other topics in the *Essais*, the educational proposal elaborated by Montaigne is also structured in two different ways: two chapters focus on education, *Du pédantisme* (I, xxv), and *De l'institution des enfants* (I, xxvi), both already mentioned; and many other passages are found in different chapters, where this topic is not the most relevant, but where the author develops some related issues such as journeys, experiences, history, language, and conversation. For his educational proposal, therefore, Montaigne carries out an argumentative strategy in order to avoid strict observance of the classical discourse codified by the tradition of the Renaissance treatise, but this strategy is not a radical betrayal of the previous works. The dialogue with tradition is always constant and remarkable; at the same time, the *Essais* find lines of flight to depict a new type of education, combining classical aspects elaborated by humanism with the uncertainties coming to light towards the end of the Renaissance.

Therefore, in the argumentative framework utilized by Montaigne to illustrate his educational proposal, we admire the elegant consistency of complex writing often chosen by the author to ponder upon the many topics addressed in his book. The link between I, xxv and I, xxvi is grounded not only in their proximity but also in Montaigne's own explicit clarification to introduce his dedication of *De l'institution des enfants* to Diane de Foix and her son: the *pars contruens* after the *pars destruens* of a true essay on education, a movement between the manner to teach, learn and the substance of culture. In *Du*

pédantisme, the focus is on the accurate, ironic criticism of *magister*; Montaigne plays on two different levels: he analyzes the separation between culture and life, stressing that, in his time, knowledge was often useless erudition, tinsel exhibited to be considered cultivated without having any practical consequence; therefore the cultural transmission by teachers was unable to transform pupils. These considerations had long been traditional, but in the *Essais* they are addressed to teaching and to the author himself because the refusal of a bookish culture is first and foremost applied in writing: in this sense, the book shows the very idea of culture proposed by its author. This aspect clarifies the importance given to the manner in which knowledge is learned and lived, and it is the topic of the first pages of the following chapter; Montaigne chooses to open I, xxvi with many considerations on his relations with tradition, creating continuity between writing, education, the book considered as a child, and the criticism of pedantry. This is the framework wherein the dedication to Diane de Foix is placed: the gesture of addressing an educational proposal to a specific person is another link with tradition, but, once again, Montaigne takes the opportunity to reinvent the classical structure of the treatise. The core of his discourse is the profile of the preceptor and, as in the previous chapter, his manner of teaching, an approach to culture that is exactly the same as that used by the author himself in writing his book. Many elements proposed as key features of the preceptor are already present in the Italian context and in Erasmus: kindness. And the ability to adjust his work according to the pupil's capability, the refusal of corporal punishment, and the attention to language and education of the body. In the *Essais*, however, all these aspects are transformed thanks to the global approach focused on shaping judgment; the method proposed involves the pupil actively and avoids any dogmatic transmission of knowledge, in order to open the widest horizon of possibilities. The *cursus studiorum* is devoted to learning the *varietas mundi* and to maintaining a free judgment, without, at the same time, refusing a complete adhesion to his own time. The troubles of the sixteenth century find an educational answer in an

atypical, risky proposal: the *homme accompli* born from Montaigne's pages lives within his own society, but with critical detachment. The recommendations addressed to the preceptor always point in this direction: the pupil must enjoy *varietas* thanks to journeys and history, finding differences in space and time, in order to apply and refine his knowledge through experience. "Ce grand monde, que les uns multiplient encore comme espèces sous un genre, c'est le miroir où il nous faut regarder, pour nous connaître de bon biais. Somme, je veux que ce soit le livre de mon écolier" (I, xxvi): as in Guicciardini, in order to teach *discrezione*, in Montaigne's judgment, the best book proves to be the world. To balance the vertigo of *varietas* without losing his orientation, the pupil's education starts with philosophy; the fine pages dedicated to this *magistra vitae* present a gentle image, a study aiming to govern himself at self-government in uncertainty, and the reference to Alcibiades is a powerful suggestion confirming a noble ideal of the human being. The game of mirrors involving the educational proposal, the author, and the book is stressed in the last pages of the chapter wherein Montaigne describes his own education, also mentioning his experience as an actor during his studies at Guyenne Collège.

The important role of education arises from the main purpose of the *Essais*: the creation of a captivating portrait of the *gentilhomme* is rooted in many aspects directly linked to this moment of life. Therefore, other relevant chapters could be interpreted as an extension of the briefer assumptions already presented in *De l'institution des enfants*. In this chapter, journeys to foreign countries are a tool in shaping the judgment thanks to a comparison with the culture of others "pour froter et limer notre cervelle contre celle d'autrui" (I, xxvi); in the chapter *De la vanité* (III, ix), we find a longer reflection on the habit of traveling but this time focused on the author. Montaigne describes how he travels, stressing his desire to experience the differences offered by other countries and other languages. This image of the journey has two relevant aspects: (1) the encounter with what is different is a classical instrument of skepticism, because it breaks the uniformity of the

habitual context. In this sense, traveling is a way to cultivate doubt. (2) Yet traveling offers the chance to escape from daily obligations and find critical detachment. In III, ix, Montaigne juxtaposes the duties of running his household and the temporary freedom of the journey. The openness towards the world and its differences, a warm sociality for learning lessons from others, is also an opportunity for the traveler to see himself in a different way, profiting from a situation when the grip of his social role is less powerful. There is also a critical detachment from his habitual identity, and this is close to another topic of the *Essais*: loneliness. This topic is thematized in the chapter *De la solitude* (I, xxxix): here we meet the famous passage dedicated to the *arrière-boutique*, a back room where we can establish "our true freedom." Between civic engagement and private retirement, the gentleman of the *Essais* searches for a proper distance from the tumult of his time, without forgetting his duties towards society and himself. Public life is mostly arranged thanks to the relationship created by language, consequently, conversation has an important role in Montaigne's book; in I, xxvi the author's discourse is a balance between the educational proposal and his own approach: "Non pédantesque, non fratesque, non plaideresque, mais plutôt soldatesque." The development of this theme is carried forward in III, viii, *De l'art de conférer*, *The art of conversation*: the topic is one of the most distinctive of the sixteenth century, thanks to Italian tradition and contributions by Castiglione, Guazzo, and Tasso. In France, the debate on conversation is also linked to considerations about the language, especially after the publication of Joachim du Bellay's work, *Défense et illustration de la langue française* (1549), a book inspired by Sperone Speroni, *Dialogo delle lingue* (1542).

Like the journey theory, the ideal conversation proposed by Montaigne in I, xxvi and III, viii combines some elements derived from the previous tradition with original nuances; kindness and politeness are already codified for describing the Italian *cortegiano* and, with specific attention to education, they are elaborated by Erasmus, especially in the *Institutio principis christiani* (1515) and in the *Colloquia familiaria* (1518). In

Montaigne's thought, the art of conversation takes its cue from these models and from Guazzo (Panichi 1995), but it mostly becomes an occasion for exercising the reader and the author in relation to others; this is why the literary elegance of the dialogue is less important than liveliness and courteous sincerity. The confrontation with others aims to search for the truth, a truth that could be temporary and a starting point for further conversation, but which implies honesty and order, avoiding dogmatism and conflicts. In an age of fanaticism, the public word is sustained by critical respect for diversities, and, once again, it is an art for shaping judgment. With the same rhetorical strategy utilized for the journey, the elements and the competencies required for an appropriate conversation are outlined as key characteristics of the educational proposal, of the author's writing, and of the ideal *homme accompli*. Living in the world means choosing conversation as a paradigm for exploring the *varietas*; Montaigne is driven by his *honnête curiosité*, an approach that leads him from history to his own time, from classical philosophers such as Seneca, Plutarch, and Lucretius to Bodin and Charron, constantly with the desire of self-discovery through the medium of otherness. But this urge towards the possibilities of reality, this insatiable curiosity is never without personal participation: knowledge and ethics are never apart; when Montaigne's pen describes the native populations of the Americas, in *Des cannibales* (I, xxxi) and *Des coches* (III, vi), this ethical propensity is evident (Montaleone 2011). The strangeness of others is a subject for judgment, but, at the same time, it is a means for criticizing our certainties: the lesson of skepticism is carefully applied for self-orientation without losing our interior freedom.

This coexistence of doubt and ethics, of participation in society and intimate detachment, is at the core and represents an original balance of the complex outcome of the *Essais*: a human being to be a model for the centuries to come in Europe, a gentleman wise in judgment and capable of living in his society without getting captured by the worst tendencies of his changing world. This is an ideal that finds its fulfillment in the notion of *experience*. This concept is widely present in

many chapters, but it is fully developed in the last one, *De l'expérience* (III, xiii), a beautiful rhapsody of Montaigne's approach to knowledge and to life, the final point to understand the relation between the *Essais* and the skepticism of Sextus Empiricus. If the world is the best book for exercising judgment, then our life is always in training; this attitude is perfectly described in the *Apology for Raymond Sebond*, where Montaigne proposed the distinction between philosophical schools already present in *Outlines of Pyrrhonism* by Sextus Empiricus: "Quiconque cherche quelque chose, il en vient à ce point, ou qu'il dit qu'il l'a trouvée, ou qu'elle ne se peut trouver, ou qu'il en est encore en quête." Of the three approaches of classical philosophies, the first attributed to dogmatism, the second to the New Academy, it is the last, derived from Pyrrhonism, that seems to be the one chosen by Montaigne because it encompasses human weakness, often seen in comparison with the senses of animals, and the natural aspiration to knowledge. This assumption is also an antidote against a twofold risk: being certain of the truth and leading a life totally different from the norm, or else collapsing into deadly inertia. The possibility offered by Sextus Empiricus is to have a constant attitude of research, a choice stressed by the motto engraved on Montaigne's medallion: "Que sais-je?". On many subjects, the analysis carried out in the *Essais* seems to result in an endless alternation of different positions, because reality is "infini en matière" and "infini en diversité," but this point of arrival, in a critical dialogue with Pyrrhonism, is in fact only a gnoseological step presented in the *Apology*, and it opens out onto relevant consequences if we look at the final chapter, *De l'expérience*. Here, in a fascinating journey among different fields of study, Montaigne describes a way of life where the role of doubt and the awareness of the tragedy of the human condition find a challenging balance for portraying adequate conduct, a complete acceptance of our being. Starting from the desire for knowledge and the weakness of human reason, Montaigne utilizes the key of experience to question medicine, the law, and every dogmatic assumption in ethics, to erode every general rule

with the power of the exceptions rooted in every personal experience. Through this prism, however, the duty of the gentleman is to live accepting his condition: “La grandeur de l’âme n’est pas tant tirer amont et tirer avant, comme savoir se ranger et circonscrire [. . .] Il n’est rien si beau et légitime que de faire bien l’homme et dûment” (III, XIII). A complete acceptance of our condition also signifies the possibility to choose between the different options faced in everyday life, as required by social obligations within the public context. Of course, this is not an easy task, as stressed on the last page of the *Essais*: by introducing a brief sentence, Montaigne qualified this aspiration verging on the extreme of human capacity: “C’est une absolue perfection, et comme divine, de savoir jouir loyalement de son être.” Absolute perfection, almost divine, these are unusual terms for Montaigne’s writing, in which the classical metaphysic has always been criticized, but this passage is impeccably inscribed in a proposal in which the balance between normality and the possible, knowledge and unknowledge, heroism and beastliness are all elements of the human condition, coexisting in a living tension.

There is a last important aspect for an understanding of the originality of the *Essais*: the pivotal role of friendship. Montaigne analyzes this theme in an important chapter, *De l’Amitié* (I, XXVIII), a chapter dedicated to his friend, Etienne de La Boétie, who is praised as a wise man and the perfect companion to share a part of his life. In the first edition of the *Essais* with only two books, the place reserved for this chapter was highly significant, because it was also used by the author to introduce some poetical works by La Boétie, which constituted the following chapter. The sonnets by this ideal friend were then placed in the mathematical center of the first book, which was composed of 57 chapters; this choice is justified with a significant analogy: like a painter who places his masterpiece in the center of a wall and fills the free spaces around it with *grotesche*, so Montaigne merely depicts similar capricious representations in order to leave his friend the place of honor. In the following edition, this tribute was removed as the result of certain editorial issues and, probably, because Montaigne reconsidered whether this publication was advisable. The

discourse about friendship proposed in these pages is an opportunity to celebrate La Boétie as well as suggest the role of friendship as a dimension of freedom for a gentleman. Montaigne distinguishes true friendship and other social relations in public and social life: family ties, marriage, and political ties. These types of relations are not completely free, because the parties involved are conditioned in their choice by some other reasons, such as family interests or social advantages. True friendship is placed under the mark of freedom: in dialectical tension with the idea of *varietas*, friendship finds its profile thanks to the similarity of the parties who establish a relation where social duties are suspended and common interests justify an intimate conversation. In this sense, friendship is the cornerstone of the *Respublica litteraria* and the reference to La Boétie assumes a wider importance for an understanding of the whole book. From the very beginning of the *Essais*, Montaigne defines his work as a “livre de bonne foi” (*Au lecteur*), a “well-meaning” book, but we must interpret this honesty in the framework of friendship. The book is addressed to a *suffisant* reader, because “C’est l’indiligent lecteur qui perd mon sujet, non pas moi” (III, IX). The author adopts a rhetoric that searches out its readers in order to create with them a relationship focused on complicity, exactly as in friendship. This approach involves the reader of the *Essais* in a conversation with the author deployed at different levels: the book is demanding, because it requires its reader to manage irony, elisions, and ellipses, but this rhetoric is the perfect representation of the exercise of judgment as an original form of sociality. In a famous passage describing his book, Montaigne writes: “Tant y a qu’en ces mémoires, si on y regarde, on trouvera que j’ai tout dit, ou tout désigné. Ce que je ne puis exprimer, je le montre au doigt” (III, IX): this strategy is rooted in a complicity which allows the author to analyze problematic topics, such as the immortality of the soul, torture or the role of religion in morality; at the same time, the search for a reader who is also a friend features a smaller society within society, a group of peers bound by *sodalitas* and unfettered by conflicts of fanaticism. The portrait of Montaigne, indistinguishable from the *homme accompli* proposed

by the *Essais*, “Je n’ai pas plus fait mon livre que mon livre m’a fait. Livre consubstantiel à son auteur” (II, XVIII), is a fragmented mosaic which portrays with ink on paper an original interpretation of the *Man with a Glove* by Titian (1523), an ideal of nonchalance and *sprezzatura*, conscious of the tragic human condition, but obstinately intrigued by the book of the world and its possibilities.

Impact and Legacy

The impact of the *Essais* on Western culture is a broad theme; here we can only offer brief notes and indicate some excellent recent works for further information. During the last 20 years, the studies on Montaigne and his book have increased; the results are diversification of analyzed topics and of the approach used. Among the important references for obtaining an idea of Montaigne’s impact and legacy, we would like to mention the *Dictionnaire Montaigne* and *The Oxford Handbook of Montaigne*, both edited by Philippe Desan (2016, 2018). Part II of the second book is addressed to the *Reception of Montaigne* and it consists of four chapters: *Montaigne in the World* by Paul J. Smith, *Montaigne in England and America* by Warren Boutcher, *Montaigne and Shakespeare* by William M. Hamlin, *Montaigne and Descartes* by Michel Moriarty; these works clearly demonstrate the diffusion and influence of the *Essais* in our philosophy and, more generally, in our culture. As we have seen in Montaigne’s biography, moreover, his importance was already recognized in his own time, since he was an important member of the *Respublica litteraria*, both as a philosopher and as a magistrate, and thanks to the rapid spread of the *Essais* in France and abroad. Montaigne’s thought was an original answer to the crisis of his society, but his lesson, however deeply rooted in its historical context, has been heard across the centuries. Echoes of the *Essais* are present in French skepticism, Pierre Charron and François de La Mothe Le Vayer, and Montaigne’s doubt is the driving force behind the *Discours de la Méthode* by René Descartes (1637); the bold idea of a gentleman was at the core of the early works by Baltasar Gracián and of

Les Maximes by François VI de La Rochefoucauld (1665) and it is still a reference for *Les Caractères ou les Mœurs de ce siècle* by Jean de La Bruyère (1688). Also, the ideas on education elaborated by Montaigne have been a reference point, especially for his focus on life and for the role assigned to experience, for example, in two authors as different as John Locke and Jean-Jacques Rousseau. It is important to stress, however, that over time the *Essais* have changed many times: the most widely read edition before the nineteenth century is different from the current reference edition. After Montaigne’s death, Marie de Gournay’s interventions for the 1595 edition had modified many passages of the *Essais*; the 1635 edition, based on that posthumous edition, was later the reference for the successive French editions and foreign-language translations. It was only in 1802, after the discovery of a copy of the 1588 edition annotated by Montaigne himself, the so-called *Bordeaux Copy*, that we had a first edition based on where these modifications are registered, published in Paris for the Imprimerie de P. et F. Didot. Since then, scholars have been querying which edition of the *Essais* provides the last work realized by Montaigne between 1588 and 1592; both sides have valid reasons and two important French editions (Montaigne, 1998; 2007) have made opposite choices. In brief, the 1595 edition has the advantage of tradition, being the version of the *Essais* read for two centuries that created the reputation of the book; the editions based on the *Bordeaux Copy* are more recent, but it is certainly Montaigne’s last work. Still today, the most characteristic feature of the *Essais* seems to be the movement (Starobinski 1982), and our responsibility remains to follow Montaigne’s words: “Plutôt difficile qu’ennuyeux. Eloigné d’affectation: Dérégulé, décousu, et hardi: Chaque lopin y fasse son corps” (I, xxvi).

Abstract

Geminiano Montanari was an Italian mathematician and astronomer. He is mostly remembered for the discovery of the star Algol in the constellation of Perseus and his cometary observation of 1667, also quoted by Newton. Trained as a lawyer in Florence, he then devoted himself to the study of physics and mathematics. He started his career as an astronomical observer at the observatory of Panzano. From 1664 on, he held the professorship of mathematics in Bologna and then of astronomy and meteorology in Padua. He wrote on diverse topics, ranging from ballistics, hydraulics, astronomy, and monetary theory. Recent scholarship has also emphasized his epistemological reflections on the experimental method as an example of theorization of the experimental practice in continental Europe.

Biography

Montanari was born on June 1, 1633, in Modena. He moved to Florence in 1653, where he studied law under the direction of the lawyer Iacopo Federici. In 1656, he moved to Salzburg where he obtained a binational doctorate in law. He then studied mathematics in Vienna under the supervision of the Florentine mathematician Paolo Del Buono, a disciple of Galileo. In 1657 and 1658, he visited the mines of the provinces (and especially of Hungary) under the mandate of the emperor. In the same year, he came back to Florence where he started his legal practice. In 1661 he was in Ferrara at the court of Alfonso IV d'Este (1634–1662), where he held the title of ducal philosopher and mathematician. At his behest, he assisted to astronomical observations and computed calculations of ephemerides and then published them with the marquess Cornelio Malvasia (1603–1664). After the death of Alfonso, he moved to Cornelio Malvasia's villa in Panzano, endowed with an observatory. With Malvasia, Montanari performed astronomical observations during the years 1662 and 1663 and contributes to the publication of *Ephemerides Novissimae* (1662). Through Malvasia, he met Domenico Cassini and Giovanni Battista Riccioli in Bologna. At the death of Malvasia in 1664, he obtained the chair in mathematics in Bologna, which he held for 14 years. He supported the institution of an observatory and collaborated with Cassini, now in Paris. With Carlo Antonio Sampieri, he established the Accademia della Treccia (affiliated with the Accademia del Cimento), leading research on fluid dynamics. Through the Accademia della Treccia, he also entered in contact with the Royal Society of London. In the 1670s, he was involved in a public polemic with the Livornese logician Donato Rossetti (1633–1686) on the nature of tempered glasses. In 1678, he was called by the Venetian senate to read at the University of Padua, where a chair of astronomy and meteorology was established specifically for him. After 6 years in Padua, he obtained the *ricondotta* from the Venetian senate. During

his stay in Venice, he also engaged in works of public utility – especially connected with mining, hydraulics, and coinage. Of overweight constitution and weighed down by the frequent trips that he had undertaken to supervise public hydraulic works, he was caught by a stroke in 1783, losing the sight of one eye and suffering impediments in speech and ambulation. Having to stop his services as an engineer, he drafted treatises on water and money, which will be published posthumously. Also *Le forze d'Eolo: dialogo fisico-matematico sopra gli effetti del vortice* will be published posthumously in 1694. He died on October 13, 1687, in Padua of a recrudescence of his disease.

Heritage and Rupture with the Tradition

Montanari was educated by Paolo Del Buono, a pupil of Galileo. In this regard, he followed this example of a scholar who was prone to direct observation (especially astronomical) and could apply his mathematical knowledge to different fields – from astronomy to hydraulic, from money theory to mechanics, as well as to the solution of practical engineering problems, and from the construction of mines to hydraulic public works. Proof of this is, for instance, his publication on ballistics (*Manualetto de bombisti*, 1682b), which was designed for practical use. At the same time, Montanari has been recognized as part of a broader intellectual community that theorized the methodology of the experimental practice and actively pursued the public good as the ultimate goal of the scientific inquiry (see Vanzo 2016). This is also testified by his activity as a founder of institutions: in addition to the Accademia della Treccia, Montanari also favored the establishment of a number of astronomical observatories in Bologna and Veneto. His public commitment is also testified by his lifelong engagement against astrology which culminated in the publication of *L'astrologia convinta di falso col mezzo di nuove esperienze* (1685).

Innovative and Original Aspects

Montanari is now mostly remembered for his observation of the second brightest star (called Algol) in the constellation of Perseus which varied in brightness (*Il Discorso astronomico sopra la sparizione d'alcune stelle*, 1671a). This publication had not only an observational goal, but also a theoretical one: it meant to disprove the Aristotelian thesis of the incorruptibility of heavens. His early publications dealt especially with the compilation of ephemerides (Malvasia et al. 1662) and astronomical observations (Montanari 1665b). *Pensieri fisico-matematici* (1667) collected a series of experiments and observations conducted at the Accademia della Treccia, especially addressed to the study of the phenomena of capillarity. Montanari's experiments are underpinned by a corpuscularian understanding of matter. *Pensieri fisico-matematici* (1667) ensued a harsh polemic with Donato Rossetti (1633–1686), a pupil of Borrelli's and then professor of logic in Pisa (and after in Turin). While Montanari explained the problem of capillarity through the concept of viscosity, Rossetti argued that atoms had the power to attract and repel each other in a vacuum. The polemic later involved other issues, as, for instance, the question of equilibrium (*Prostasi fisico-matematica*, 1669) of tempered glasses (*Speculazioni fisiche*, 1671b). Gomez Lopez (1997) has framed this controversy as an example of the fragmented positions sustained by the Galilean school in seventeenth-century Italy.

Impact and Legacy

Montanari had surely a great impact on the establishment of an experimental tradition in Italy during the post-Galilean period. His activity as an astronomical observer was known outside the Italian peninsula, to the extent that his observation of the great comet of 1680 (*Copia di lettera scritta all' Illmo. Signore Antonio Magliabecchi: bibliotecario del serenissimo Gran Duca di Toscana, sopra i moti, i le apparenze della comet ultimamente apparsa sul fine di Novembre*

1680) is quoted twice in Newton's *Principia mathematica* (1687). A crater on the moon is named after Montanari.

Moon, Renaissance Image of the

Matteo Cosci

Università Ca' Foscari Venezia, Venice, Italy

Abstract

The history of modern selenography, i.e., the study of the surface and astrophysical features of the Moon, can find its beginning with the neglected contribution of William Gilbert at the start of the seventeenth century and its conventional end with the work by Giambattista Riccioli and Francesco Maria Grimaldi 50 years later, with the inevitable mention to the revolutionary telescopic discoveries by Galileo and to the milestone published on the subject by Johannes Hevelius in between. The interest regarding Earth's unique satellite and its conformation, however, is certainly more ancient, and it was undoubtedly kept alive and brought forth also thanks to the contribution of many other unnamed observers besides the greatest astronomers of the Western tradition, e.g., for meteorological, astrological, and religious reasons that the scientific surveys of the Moon usually did not take account of. In Renaissance time, in particular, the Moon was not only at the center of the astronomical horizon but also became a sort of speculative battlefield between different scientific, technological, and political accounts that were raging across a troubled Europe that somehow was there mirroring his inner hopes and daydreaming expectations.

Innovative and Original Aspects

The history of modern selenography, i.e., the study of the surface and astrophysical features of the Moon, can find its beginning with the neglected contribution of William Gilbert at the start of the seventeenth century and its conventional end with the work by Giambattista Riccioli and Francesco Maria Grimaldi 50 years later, with

the inevitable mention to the revolutionary telescopic discoveries by Galileo and to the milestone published on the subject by Johannes Hevelius in between. The interest regarding Earth's unique satellite and its conformation, however, is certainly more ancient, and it was undoubtedly kept alive and brought forth also thanks to the contribution of many other unnamed observers besides the greatest astronomers of the Western tradition, e.g., for meteorological, astrological, and religious reasons that the scientific surveys of the Moon usually did not take account of.

William Gilbert studied the lunar orb and drew a naked-eye map of the Moon. It was not published until 1651 with the title of *De mundo nostro sublunari Philosophia nova*, although the original manuscript dates back to end of the sixteenth century. Gilbert's purpose there was threefold: (1) looking for a proof that the Moon has its own unbound orbit around the Earth and was not moved passively as embedded in a solid geocentric sphere; (2) detecting changes in the appearance of the lunar disc in order to shed light on its apparent oscillation (a phenomenon known as "libration," i.e., the small but notable apparent movement of the moon in its monthly orbit, that seems to happen in longitude and in latitude, which he noticed, without a telescope, 40 years before Galileo); and (3) accumulating observational evidence for solving through its reference the urgent problem of determining longitude during navigation (Pumfrey 2009, 2011). Moreover, he gave the first geographical nomenclature to some regions of the Moon (an onomastic schema that somehow reminded British imperialism of that age), since Gilbert thought that the satellite was not entirely constituted by water, but also of extensive lands, that were waiting to be colonized.

Before him just Leonardo da Vinci drew naked-eye sketches of the Moon, being convinced that "the part of the Moon that shines consists of water" and that its spots were shadows caused by the Moon's clouds on its oceans (and not, as it was thought, mirror-like reflections of the Earth on Moon's surface). Perhaps Girolamo Fracastoro had a more clear idea of the Moon's appearance before them, because, as he wrote in his

Homocentrica (1538), he had the chance to observe it through a magnifying glass (van Helden 1977, pp. 17, 28).

However, it was the British mathematician Thomas Harriot that made the first known *telescopic* sketch of the Moon in July 1609, albeit unpublished at that time. After his reading of Galileo's *Sidereus Nuncius*, Harriot pursued an even better prospect of the satellite with the help of his friend William Lower. In fact, among his notes, there is an annotated drawing of the full moon face, as a result of his 1611–1612 observations, although very poor in detail (probably because of the rudimentary 6x telescope he used).

On the 30th of November, 1609, Galileo turned his own built telescope – an instrument capable of 20-power magnification – toward the satellite, noticing with great excitement that, as he wrote, "the Moon is by no means endowed with a smooth and polished surface, but is rough and uneven and, just as the face of the Earth itself, crowded everywhere with vast prominences, deep chasms, and convolutions." What have been called for centuries "*maculae*" or "lunar spots" revealed themselves as actual horographic features for the first time, and the Moon no longer appeared at his eyes as a polished, translucent crystalline sphere. Thus Galileo drew his famous sepia ink-wash watercolors in order to show how progressed the pattern of illumination and the shadow line (or "terminator") as the angle of incidence of solar light was changing there. It has been recognized how much Galileo's drawings of the Moon bear signs of Renaissance pictorial techniques (shading, perspective, etc.) and awareness of coeval map-making conventions (marked coastlines, darkened lakes, etc.). Those illustrations remained the unsurpassed standard for nearly 20 years, both for scientists (Scheiner, Malapert, Biancani, Borri) and for artists (Cigoli, Elsheimer). Also in the original four copperplate engravings from the first edition of *Sidereus Nuncius*, it can be appreciated the esthetic quality and the detail, e.g., the typical light-and-shade pattern produced by obliquely illuminated craters, then lost in the subsequent prints. However Galileo altered many lunar details in order to reach a higher explanatory effect, stylizing or exaggerating the size of lunar

features, and that happened “because they were meant as illustrations of his verbal arguments about the Moon’s nature” (Winkler and Van Helden 1992, p. 107) and not as neutral, objective depictions (this in part explains some macroscopic omissions remarked by his successors and critics, such as *Mare serenitatis*, from the final renderings). In 1632, after reiterated observations, Galileo was aware of lunar libration too. Despite Galileo’s discoveries, scholastic theologians were at first neither ready nor available to accept any revision of the traditional aristotelian-avverroistic theory, since they maintained that those discoveries were not sufficient to invalidate secular strongholds, such as Moon’s essential incorruptibility and its facing the sublunar world as the cause of its one-side imperfection (Ariew 1984, 2001; Wilson 2001).

The Jesuit Christophorus Clavius rather tried to restore the traditional view recovering the thesis of different density in lunar material as the reason for the detectable spots, since in medieval times Averroes, as Avenatha (Ibn Ezra) before him, linked the nature of the Moon with that of the Earth and believed that the Moon was constituted by more or less dense parts of incorruptible substance, which consequently receive the light of the sun and release it with a sort of fluorescence with different intensity – and that is because they retained that spots could be seen on its surface (Duhem 1985, pp. 481–482).

Well before the beginning of telescopic astronomy, Kepler conjectured that the Moon was a celestial body similar to the Earth. In fact, noticing the evolving irregular patterns of light and shadow on the surface of the Moon, Kepler reached the same conclusion as Galileo’s, albeit speculatively, in his *Astronomia pars optica* (1604). Moreover, in his *Dissertatio cum Nuncio Sidereo* (1610), he underlined that many results among Galileo’s conclusions had been anticipated by previous astronomers and in part by himself too. For instance, he said the idea that the Moon’s superficial conformation is similar to the Earth’s surface could be traced back to the second century AD, when Plutarch wrote his treatise *On the Face which appears on the Orb of the Moon*.

Some perplexities were raised by Galileo’s discovery of the so-called secondary light of the Moon, which he noticed as detectable during lunar eclipses. On this issue, in 1626 Bartholomew Amicus maintained, again with Averroes, that the Moon receives its light from the Sun and “incorporates” it within its own smooth body, making that light its own light. The following year Raphael Aversa thought on the contrary that the Moon lacked an innate light since it cannot acquire solar light because its surface was considered perfectly transparent, albeit with more or less opaque zones. Aversa also disregarded Galileo’s theory of the “secondary light” of the Moon as solar light reflected on the satellite by the Earth. For him, as for many other seventeenth-century scholastic authors, “Moon’s secondary light... comes from the surrounding parts of the heavens, seemingly from sunlight reflected to the Moon from other celestial bodies,” Earth excluded (Grant 1994, p. 406).

Galilean observations gained a wide echo also in arts, as it is emblematic in the fresco *The Virgin of the Immaculate Conception* depicted with great license by Lodovico Cigoli on the Cappella Paolina in the Roman church of Santa Maria Maggiore (1610–1612), since it shows a cratered and maculate Moon, much as it appeared in Galileo’s drawings (Ostrow 1996). However, it was in the field of literature that the Moon as a new object of discovery and daydreaming phantasies gained the larger space. For, fictional accounts of imaginary travel to the Moon, whose archetypal model was Lucian’s *Alēthē diēgēmata* (*True Stories*) dating back to the second century AD, were so numerous in the Renaissance that can only be listed here, starting with the famous XXXIV canto of Ludovico Ariosto’s *Orlando Furioso* (1532), to subsequent other contributions as Ben Jonson’s *Newes from the New World Discover’d in the Moone* (1620); Kepler’s *Somnium* (posthumous publ. in 1634, but composed in 1609), Francis Godwin’s *The Man in the Moone, or a Discourse of a Voyage Thither by Domingo Gonsales, the Speedy Messenger* (1638), Cyrano de Bergerac’s *L’autre Monde: Les Etats et Empires de la Lune* (1649), Pantaleón de Ribera’s satirical *Vexamen de la Luna* (1626),

John Wilkins's *The Discovery of a World in the Moon* (1638, where, as in *Somnium*, it was imagined that the Moon was inhabited), etc. (cf. Nicolson 1948; Romm 1989; de Armas 1999; Bezzola Lambert 2002; Chen-Morris 2005; Houston 2010).

Between January 1637 and December 1638, working on Kepler's hypotheses on planetary motion, a 20-year-old Jeremiah Horrocks was the first to demonstrate that the Moon moved in an elliptical path around the Earth by analogy to the motions of a conical pendulum, and on this issue he also anticipated Isaac Newton in suggesting the gravitational influence of the Sun, as well as the one of the Earth, on the Moon's orbit (Wilson 1987a, b).

Between 1628 and 1637, Nicolas-Claude Fabri de Peiresc e Pierre Gassendi, with the help of the painter Claude Mellan, undertook a major project of accurate depiction of the lunar face as an aid for determining the precise longitude of the Earth in its reference. The project was partially completed with three engravings that were undoubtedly successful from the artistic point of view but in a way that was almost useless for the astronomical needs that it was planned for.

In order to solve the same problem, the cosmographer and map-maker Michael Florent van Langren produced what is generally regarded as "the first true map of the Moon" (Whitaker 1999, p. 128), whose first version was completed in 1645 with an entire new set of nomenclature for the depicted lunar topography, denominated after the names of eminent people – "the basic scheme of nomenclature that is used to this day" (ibid., p. 129). No matter how remarkable, this result was soon superseded by Hevelius' groundbreaking map.

In fact, the real game-changer in the field was the publication of Johannes Hevelius' *Selenographia: sive Lunae Descriptio* (1647), which really rose the bar in Moon observation and depiction thanks to his own built 40x telescope that did not suffer from spherical nor chromatic aberration. "*Selenographia* remained the standard work of reference on the subject for well over a century" (Whitaker 1989, p. 134), being "truly one of the greatest publications in

all seventeenth-century European astronomy" (Montgomery 1999, p. 173). There Hevelius showed the entire lunar face, also comprehensive of the libration zones, with no shadows, as if it were homogeneously enlightened from a unique source of light. From observation to the printing of the engravings, everything was under his control, as unprecedented guarantee of reliability of the visual evidence provided to the readers. The esthetic quality of his scientific illustrations was impressive, even though the baroque size of his plates struggled to preserve the precision of details for necessary longitude measurements. He proposed new names for lunar features inspired by classical characters and figures on the basis of presumed and idealized similarities with respective areas of the Earth. He even thought that certain areas were inhabited, while others were regions of volcanic activity.

In 1649 Eustachio Divini arranged a broadsheet of a full Moon, correcting and improving a bit Hevelius' work. The following year, Gerolamo Sersale offered another large image of the lunar face, adding new details to Hevelius' map and thus improving on his turn the topographical knowledge in that regard. But it was only when another Jesuit – Giambattista Riccioli – contributed to the research by providing what would have been a new, monumental classic on the subject, namely, the ambitious *Almagestum Novum* (1651), that a new reference text came on the market raising the selenographical standard to an unprecedented level. Riccioli's work was equipped with new and more precise maps of the satellite provided by his assistant Francesco Maria Grimaldi, correcting many errors of almost all their predecessors and restoring an expanded version of van Langren's naming schema. The positive reception of this achievement was so wide that it finally imposed its naming over Hevelius' one, after a long period in which the two works were used as a parallel reference.

Finally, while in his *Questions on De caelo* (1657) the German Jesuit Melchior Cornäus rejected the existence of lunar epicycles and assumed that the Moon moves through a fluid medium, the fact that the Moon always exhibits the same face to earthly observers was explained

by Otto von Guericke in his *Experimenta nova* (1672) rejecting the superseded epicycles theory with the idea of an attractive force emanating from the Earth which holds the Moon in its orbit so that the same face is always the one seen.

Abstract

Ambrosio de Morales (1513–91) was a Castilian humanist historian, antiquarian, and teacher of rhetoric at the University of Alcalá.

Best known for his *General Chronicle of Spain* (1574–86) and its companion volume, *The Antiquities of the Cities of Spain* (1575), Morales also wrote historical commentaries and literary and moral essays. Although he made no truly original contributions to philosophy, he is an important representative of a Catholic humanist tradition that sought to synthesize elements of Erasmian humanism with neo-Thomist moral theology and Tridentine doctrines of ecclesiastical authority. He transmitted these ideas mainly through his historical writings. As a historian he was both methodologically and culturally conservative. He asserted the ethnic essentialism of the Spanish nation, as well as the central role of Roman Catholic Christianity in Hispanic identity. While he advocated critical humanist methods for historical research, he was also a deeply committed counter-Reformation Catholic who strove to reinvigorate the cult of the saints by reviving hagiographical and martyrological traditions and defending pious historical legends against skeptical critics. Morales exerted a lasting influence on Spanish historical thought. Although his literary and moral essays were less widely read, his *Chronicle* was regarded for more than two centuries as one of the most thorough and reliable narratives of Spanish history, especially ecclesiastical history, and as a model of judicious critical historiography.

Biography

Morales was born in Cordoba in 1513 to Mencia de Oliva and Antonio (Antón García) de Morales, a medical doctor who held the first chair of metaphysics and philosophy at the newly founded University of Alcalá. Ambrosio was raised in aristocratic circles in Cordoba, learning Latin and elementary theology from private tutors. He began his formal studies at the University of Salamanca in 1526 under the tutelage of his maternal uncle, the humanist Hernán Pérez de Oliva. He left Salamanca and returned to Cordoba shortly after his uncle's premature death in 1531. The next year he entered the Jeronymite Order, taking

his vows in 1533 at San Jerónimo de Valparaíso, a fifteenth-century monastery overlooking the ruins of the caliphal city of Madinat al-Zahra outside Cordoba. His self-castration two years later led to his abrupt departure (perhaps expulsion) from the order, followed by a dark phase of almost a decade, of which no records survive. He resumed his university studies at the University of Alcalá de Henares around 1543, studying both theology and rhetoric. No longer in religious orders, he now lived as a secular cleric and maintained a keen interest in religious matters. By 1548 (possibly earlier), he held Alcalá's chair of "rhetoric and humanities." While this required him to lecture on Latin rhetoric, his main scholarly interests began to shift towards history and antiquities. He expanded his home into a luxurious student residence, mentoring and training a cadre of noble pupils in rhetoric, antiquities, and historical studies. His protégés, whom he remembered warmly in his writings, included Alfonso Chacón, Diego de Guevara y Haro, Juan Fernández Franco, the painter Pablo de Céspedes, and King Philip II's illegitimate half-brother, Don Juan de Austria (Redel 1909).

In 1563, Morales was named royal chronicler and charged with continuing Florián de Ocampo's unfinished *General Chronicle of Spain*. He continued the *General Chronicle* in three distinct parts (1574, 1577, 1586), which won critical acclaim. In 1575 he published a companion volume entitled *The Antiquities of the Cities of Spain*, a topographical survey of the geography, architecture, and history of about seventy Spanish cities mentioned in the *Chronicle*. Between 1563 and 1588 Morales advised the Spanish monarchy on numerous matters relating to Christian scholarship and history, including the provision of books and manuscripts for the library at the new royal palace in El Escorial, and the veneration of ancient and modern saints. In this period he also wrote more than a dozen lesser works, including a defense of the work of fellow chronicler Jerónimo de Zurita against criticisms by royal officials (1563; published in Zurita 1610); a life of Fray Diego de Alcalá (who in 1588 would become the first saint canonized since 1523) (1567; published in 1793b); a hagiographical account of the

Roman-era martyrs Justo and Pastor of Alcalá (1568); a Latin hexameter poem celebrating the Battle of Lepanto (1571; published in Morales 1987); an account of his own travels to northern Castile to examine relics, royal tombs, and manuscripts for Philip II (1573; published in Morales 1765); an edition of the works of the ninth-century Saint Eulogius of Cordoba (1574); and a life of the twelfth-century Countess Matilda of Canossa (1588; published in Morales 1793b).

In 1578, Morales moved to Toledo to serve as vicar and administrator of the Hospitals of Puente del Arzobispo. In 1582, he returned to his native Cordoba, where he completed the third volume of his *Chronicle*, advised the cathedral chapter on local hagiography, and died in 1591, aged 78.

Heritage and Rupture with the Tradition

As a young philosophy student in the late 1520s, Morales articulated a Christian humanist ethic that would inform much of his later thinking. His first known work, written before 1531, was a translation and brief commentary on the *Tablet of Cebes*, a Hellenistic Greek dialogue (attributed to a student of Socrates but probably from the second century A.D.). The dialogue describes an allegorical tablet in the temple of Kronos in Athens depicting "Life" and the moral journey toward the good, in which the traveler must find his way toward Happiness by exercising Virtue and avoiding Deceit, Riches, Lust, and other temptations along the way. Morales's commentary, probably written as a student exercise and inspired by his uncle Pérez de Oliva's teaching, asserted the consistency of this Neoplatonist teaching with Christian moral doctrine. Morales finally published the work much later, in 1586, together with a collection of Pérez de Oliva's works and fifteen "moral discourses" of his own, written around 1580. These didactic moral essays propounded an ecumenical Christian humanism that harmonized Stoic, Platonist, Aristotelian, and patristic moral teachings. It emphasized that every human being was capable of knowing and doing the good, insisted on the importance of moral instruction for the young, and asserted that

the differences between various ethical schools were less important than the similarities. These simple convictions, broadly characteristic of the Erasmian humanism that was popular in Spain in the 1520s, also appeared in many of Morales's other works. But apart from these very early and late writings, Morales rarely wrote about moral philosophy directly. The increasing mistrust of Erasmus by the Spanish Inquisition from the 1520s onward may explain why Erasmian ideas became more muted in Morales's work. After mid-century, Morales also became more firmly committed to post-Tridentine Catholic causes such as the cult of the saints that were somewhat at odds with Erasmian teaching.

Morales's interests turned toward languages and history in the 1540s, after he established himself at the University of Alcalá. Although he had mastered both Greek and Latin, his first published work, the *Discourse on the Castilian Language* (1546), was a spirited defense of the equality of Castilian with Latin as a literary language, taking its cue from Italian writers like Dante and Bembo who had made a similar case for the Tuscan vernacular. This work (which Morales reprinted in 1586) inspired similar apologies for the vernacular by Fray Luis de León and Fernando de Herrera.

The Castilian cultural pride expressed in the *Discourse* found fuller expression in Morales's historical writings. His interest in historical research and writing may be traced to his childhood in Cordoba, where his father, one of a growing number of amateur antiquarians, collected local antiquities and displayed them in the family home. Ambrosio's humanist-antiquarian colleagues in Alcalá's rhetoric faculty reawakened and deepened these childhood interests. Although history was not a formal academic subject, the required texts for Greek rhetoric included Herodotus and Thucydides, and the university's rhetoric lecturers, beginning with the great humanist Antonio de Nebrija (Alcalá's principal lecturer in rhetoric 1514–1522), regularly wrote histories and antiquarian works alongside rhetorical and grammatical ones. From the 1540s, Morales pursued his own part-time antiquarian research into Roman and pre-Roman monuments and

geography, in collaboration with both colleagues and students.

Morales turned to writing national history after the death of Florián de Ocampo in 1555. Ocampo, a onetime student of Nebrija, had labored for almost two decades on a *General Chronicle of Spain* that aspired to narrate the history of the Iberian Peninsula from its first settlement by a grandson of Noah down to the present day, in 80 books. It was loosely modeled on the *Estoria de Espanna* (*Primera crónica general*), the historical chronicle compiled in the 1280s by Alfonso X of Castile. Throughout the 1540s Morales hesitated to compete with Ocampo by writing his own history, despite his keen interest in the subject. But when Ocampo died in 1555, he had completed only five of his projected 80 books, ending with the Second Punic War (c. 206 B.C.), and Morales welcomed the invitation to take over the project. From the early 1560s until the mid-1580s he made this his main scholarly undertaking. He would add seven more books to Ocampo's five, taking the *Chronicle* from c. 200 B.C. down to c. 1030 A.D.

Morales shared many of Ocampo's approaches to Spanish antiquity, including a passion for classical authors, a belief in an essential continuity of Hispanic identity from ancient to modern times, and an ambivalence toward the ancient Romans: while he revered the Romans as cultural ancestors, he also treated them as unjust foreign invaders on Spanish soil. He adopted Ocampo's label "our Spaniards" (*nuestros españoles*) for the subjects of his history, and like Ocampo he paid tribute to the cultural diversity of pre-Roman Spain by highlighting regional differences in language, religion, and social organization. (Alvarez-Junco 2011; García Cárcel 2011) Even more overtly than Ocampo, Morales oriented his whole history toward the coming of Christianity, arguing that true Hispanic unity and identity were only achieved with the establishment of the Catholic Church. He wholeheartedly endorsed the medieval historiographical paradigm in which the Muslim conquest and ensuing "destruction of Spain" in the eighth century were the greatest misfortune in all of Spanish history and the ensuing "restoration" of Christian Spain (later to be called the

“reconquest”) the greatest blessing (Ríos Saloma 2011). In this paradigm, the Visigoths created the first unified Spanish Christian monarchy, and the Asturian-Leonese-Castilian kings who expanded their Christian territories from the ninth century onward were the Visigoths’ biological and spiritual heirs, passing the Visigothic inheritance on to medieval Castile and to the Habsburg monarchs of the sixteenth century.

Like the medieval chroniclers whose vision of medieval history he closely followed, Morales was pious and moralistic and firmly committed to an Augustinian notion of providence. He regularly pronounced moral judgment on his historical subjects, and he interpreted Spain’s misfortunes as divine punishment for rulers’ unethical conduct and successes as divine reward for sincere faith and virtuous living. He understood all historical events to be guided by providence and believed that the saints played a special role in carrying out God’s plans in history. He gave extensive treatment to the lives of saints, which he asserted should be one of the four principal themes of national history.

Innovative and Original Aspects

Morales combined his moralism with his patriotic essentialism by highlighting both the virtues of the early “Spaniards” as a people and the moral failings of certain rulers in their history. He contrasted the savagery of Spain’s Roman conquerors with the loyalty and decency of the early Iberians, which seemed to foreshadow Christian morals. The most vivid example of such contrast appears in his account of the Numantian War and the brutal Roman siege of Numantia (133 B.C.). This may have been intended as a warning to contemporary readers about the moral dangers of imperial conquest, in harmony with the teachings of Dominican theologians of the School of Salamanca, Bartolomé de las Casas and Melchor Cano. Cano had taught theology to Morales at Alcalá around 1543 (Lupher 2003). But the ideological thrust of the *Chronicle* as a whole was not to undermine Spanish imperialism; it was rather to justify imperial conquest undertaken by virtuous

monarchs for the purpose of Christian evangelization. Nor was Morales consistently anti-Roman. He praised the moral virtues of many Roman rulers and suggested that the Spanish character was deeply indebted to Roman teaching and to the secular virtues taught and practiced by pagan philosophers like the Spanish-born Seneca.

Melchor Cano’s influence may also be seen in Morales’s critical method, often regarded as the most distinctive characteristic of his historical writing. Morales presented himself as a judicious, critical-minded humanist who scrupulously evaluated his sources for “verisimilitude” (a concept Cano had emphasized in his *Loci theologicorum libri XII*). He punctuated both the *Chronicle* and the *Antiquities* with extensive reflections on source selection and evaluation, comparing the value of different kinds of evidence and offering guidelines for evaluating both textual and artifact sources (Binotti 2009). He denounced “fabulous” sources such as the medieval *Codex Calixtinus*, the *Golden Legend* of Jacobus of Voragine, and the forged “Berosus” commentaries of Anniius of Viterbo (1498) which Florián de Ocampo had used as a principal source for the pre-Roman period. Morales made more extensive use of numismatic and archeological evidence than any Spanish historian before him, much of it based on his own personal travels, transcriptions, and collecting (Sánchez Madrid 2002; Binotti 2012).

Morales’s critical spirit was firmly anchored, however, to his prior commitment to Catholic ecclesiastical authority and his desire to defend and augment the Counter-Reformation cult of the saints. He followed Cano in arguing that historical knowledge differed fundamentally from theological knowledge; while theology could offer certainty, history could only offer degrees of “probability” and must therefore remain subservient to theology and to Church teaching. Morales remained deeply respectful of medieval historiographical and devotional traditions and incorporated into his *Chronicle* many hagiographic traditions now considered legendary that he took from earlier chronicles and from liturgical sources, including the legends that the Apostles Paul and James had evangelized Spain in the first

century. Although he recognized the fallibility of oral tradition, he affirmed that popular memory alone could sometimes serve as an adequate source for a hagiographic tradition when written evidence failed. Here, too, Morales faithfully followed Melchor Cano, whose *Loci* honored both humanist critical principles and the strictly orthodox decrees of the Council of Trent; both men insisted that Catholic writers must affirm historical traditions that were supported by ecclesiastical authority, even in the face of critical doubts. For Morales, humanist criticism must serve the cause of defending the orthodox Catholic faith, which indeed he saw as one of the larger purposes of writing national history (Van Liere 2006, 2012).

Impact and Legacy

Morales's *Chronicle*, although somewhat too erudite to engage a wide audience, served as an invaluable historical source for generations of other scholars and literary writers. It informed much later history writing, as well as historical fiction such as Miguel de Cervantes's drama *Numantia* (c. 1585) (De Armas 1998). The *Chronicle* was particularly valuable to ecclesiastical historians, including forgers who enhanced Morales's account of Christian Spain with new legendary material of their own invention and critical humanists who sought to debunk such forgeries (Olds 2015). The Jesuit Juan de Mariana's *History of Spain*, the first national history of Spain written for a popular audience (Latin edition 1592, Spanish 1601), also used Morales as a principal source. The superior literary quality of Mariana's *History* made it much more popular than Morales's *Chronicle*, which soon went out of print, despite its greater erudition. Morales's work enjoyed a resurgence of popularity in the eighteenth century, when Enlightened scholars Augustinian Henrique Flórez and Benito Cano rediscovered and published his works, including many previously unpublished manuscripts, and hailed him (justly, albeit with some exaggeration) as the father of critical historiography in Spain.

Abstract

Henry More was an expounder of Cambridge Platonism, as he largely relied on a Platonic-inspired standpoint in pursuing his aims: the demonstration of the immortality of the soul, the critique of atheism, and religious enthusiasm. He maintains that the soul emanates from

God (being therefore not created and pre-existing body) and argues for the existence of a spirit of nature as means to explain natural phenomena, which cannot be accounted for only in mechanical terms. Moreover, he argues for the extended nature of God and spirits, as only in this way they can act on the world. Accordingly, More rejects Descartes's theory of immaterial substance, but relies on his ontological argument to provide a demonstration of the existence of God. His critique of enthusiasm (especially that one characterizing Neoplatonic mysticism) is medical, as he distinguishes between a rational, religious inspiration, and a melancholic one.

Biography

Henry More was born in 1614 in Grantham to a Calvinist family. He attended the local grammar school, before studying at Eton (1628) and from 1631 at the Christ's College of Cambridge. He took his BA in 1636 and his MA in 1639 and became a fellow of the College in the same year. He was acquainted with Platonism from 1635 by reading the *Theologia germanica* (Crocker 1997, 2003, 4–5), and in 1642 he composed his *Psychodia Platonica*. As he became interested in natural philosophy he started to study Descartes's philosophy and, prompted by Samuel Hartlib, he entered in correspondence with the Frenchman (Descartes 1903, 235–647, Descartes 1991, 360–382). In 1650–1651 he quarrelled with Thomas Vaughan (who had embraced Neoplatonism and mysticism), as More accused him of religious enthusiasm (Crocker 2003, 45–61). In 1650, More started a correspondence with the half-sister of his pupil John Finch, Anne (later Conway), which would last until 1677 (Nicolson 1992; Hutton 2004, 73–93). During the Interregnum (1653–1659), More published his main philosophical works: *An antidote against atheism* (1655), *Conjectura Cabbalistica* (1653),

Enthusiasmus triumphatus (1656), and *Immortality of the soul* (1659). After the Interregnum he mainly published apologetic treatises, such as the *Grand Mystery of Godliness* (1660), since, with the Declaration of Breda (1660), Charles II had promised more religious toleration (Gabbey 1982, 222–230). In 1663, he fell off with theologians Joseph Beaumont and Samuel Parker, who accused him of being a latitudinarian for his anti-Calvinist positions. More received support from Lord Conway, Anne's husband (Crocker 2003, 69–110). From 1670, More distanced himself from Lady Conway, as he rejected the mystical Kabbalah of Isaac Luria, to which Anne had been introduced by Francis van Helmont, and her Quakerism, which More considered a form of religious enthusiasm (Crocker 2003, 183–198; Coudert 1992; Fouke 1997, 152–156). In 1681–1682, he entered into another theological dispute, this time with Richard Baxter, who criticized his anti-voluntarism (Crocker 2003, 167–181). More died in 1687. (Crocker 1990a; Ward 2000; Henry 2012).

Innovative and Original Aspects

The main objectives of More were theological, as he aimed to (1) demonstrate the immortality of the soul, (2) refute atheism, and (3) explain and eradicate religious enthusiasm (More 1660, v–vi, 1662, Preface, 6; Gabbey 1982, 222–226; Hutton 2015, 144). In pursuing these objectives, he adopted Platonic-inspired arguments (being, therefore, a main expounder of the “Cambridge Platonism”) and confronted the philosophy of René Descartes.

The first concern of More was with the notion of the individual soul, which he characterizes as incorporeal and pre-existing to the bodies. According to his Neoplatonic (i.e., Plotinian and Ficinian) and Origenian conception (Jacob 1985, 1991), souls become individuated from a unique world soul (which is a hypostasis of God) and degrade from their original perfection as they are joined to three elements (ethereal, aerial, and terrestrial); therefore, souls cannot have been created by God, as this would imply that He is responsible for their degradation. Consequently, souls

pre-exist bodies and, as they ultimately emanate from God, are immortal (More 1642, 1987, 1998; Jacob 1987, i–lxxxviii; Crocker 2001; Reid 2012, 349–381). More's main target in his account of the soul is Hobbes's materialism, which he rejects since ratiocination, free will, and apparitions (Coudert 1990) cannot be explained by matter and mechanism alone. Also, More opposes Calvinist voluntarism, as God is bounded by absolute goodness (More 1668; Crocker 2001; Henry 2012). This position underlies his moral philosophy, in which he demonstrates that good and evil are absolute values, and pursued by a “boniform faculty” which includes both reason and sensation (More 1667; Henry 2012; Hutton 2015, 13–14).

In his critique of atheism (which he relates to materialism and mechanism), More uses Descartes's ontological argument for the existence of God (More 1655; Gabbey 1982, 199–204) and adopts Descartes's vortex theory to defend Mosaic cosmogony, in accordance with the tradition of the Christian Kabbalah (More 1653; Gabbey 1982, 204–205; Popkin 1990; Coudert 1992; Henry 2012). In dealing with the notion of soul, however, More comes to criticize Descartes's account of the motion of animals by matter alone (which is passive) and postulates that such motion is given by immaterial souls coextended with matter. Even God, in order to act on the world, has to be extended. As extension can be immaterial and void, More argues for the existence of an absolute, infinite space (More 1668, dialogue 1, 1995; Hall 1990b, 202–223; Henry 1986; Reid 2003, 2007, 2008, 2012, 185–236; Agostini 2011). The idea of an extended immaterial substance is elaborated into that of “spirit of nature” or “hylarchic principle” which is the inferior part of the world soul and serves to account for material causality and for gravitation. This principle explains also the experiments with the air pump performed by Robert Boyle (Boyle 1672; More 1987, book 3, Chap. 12; Hall 1990a, c; Gabbey 1982, 219–222, 1990; Reid 2012, 279–348), who however rejected More's theological use of them (Boyle 2000; Henry 1990).

Thirdly, More assumed enthusiasm among his objectives, as he distanced himself from the Platonism of Vaughan, who turned to mysticism (Crocker 1990b; Fouke 1997, 50–95), and from

Quakerism (centred on the notion of “inner light”). More mainly focused on the physiological causes of enthusiasm, such as melancholy, to which he opposed an illumination identifiable by its sobriety, rationality, and adherence to Scripture (More 1656; Burnham 1974; Heyd 1995, 92–108; Fouke 1997, 156–174).

Abstract

Sir Thomas More is one of the luminaries of Tudor England. His fame rests on several pillars: his saintly character, first attested in the

letters and biographies of his contemporaries; his best-known work, *Utopia*; and his imprisonment and eventual martyrdom for refusing to take an oath legitimizing the divorce of Henry VIII from Katharine of Aragon.

More was a lawyer, poet, and humanist. He was pivotal to the revival of Greek studies in England. He belonged to a circle of English humanists including William Grocyn, John Colet, William Lily, and Thomas Linacre and was also a close friend of Desiderius Erasmus. More was a busy and successful lawyer, and subsequently a statesman, serving as Lord Chancellor under Henry VIII. On a domestic level, More was also a significant educational reformer: his household was run as an academy, balancing piety with humane letters. He believed in women's capacity for academic education, and his daughter Margaret was celebrated for her intellectual accomplishments.

More stands at the threshold between the medieval and early modern age. His career embraces scholasticism and the new learning, inherited Christendom and the radical break of the Reformation. Intellectually, he belonged to a medieval world shaped by the *trivium* of grammar, rhetoric, and logic. These disciplines were absorbed at an early age and polished through study, conversation, writing, lectures, and legal argument. More's own rhetoric is directed to varying ends, from epigrammatic verse in English and Latin, to the sophisticated wit of *Utopia*, the intensity of his anti-Lutheran polemics and the devotional character of his prison writings in the Tower of London. Underlying this diverse body of work is the conviction that human order rests in the great impersonal structures sanctioned by tradition, chief among them the body of canonical and common law, and the teachings of the Church. It is this conviction that led to More's downfall. He could not approve Henry's declaration that his marriage to Katherine of Aragon had been void, since to do so would have admitted division into the Church and put man's word over God's law.

Biography

Childhood

Thomas More was born in Milk Street, Cripplegate, London on 7 February 1478 (though 7 Feb 1477, and 6 Feb 1478 are also possible), the son of John More (c.1451–1530), a barrister, and his wife Agnes. He attended London's leading grammar school, St. Anthony's in Threadneedle Street (c.1482–89), where he was trained in Latin grammar and the foundations of classical rhetoric. Through the offices of his father, More then entered the household of Archbishop John Morton at Lambeth Palace (c.1489–92), where he imbibed courtly manners in his service as a page. Morton was at that time Archbishop of Canterbury and Lord Chancellor, and he appears in *Utopia* as a model of sage authority. More's duties allowed time for further formal lessons and for participation in the dramatic entertainments. According to the first biography, by his son-in-law William Roper, the young More's improvisatory skill in drama struck visitors to the palace, while Morton predicted that More would "prove a marvelous man" (Roper and Harpsfield 1963).

University

Morton sent More to Oxford (c. 1492; college uncertain). There he would probably have become acquainted with the *trivium*, the curriculum of the liberal arts, comprising grammar, rhetoric, and logic. After 2 years at Oxford, he returned to London. According to a letter by Erasmus, More was dragged away from Oxford by his father to train as a lawyer. But there is no firm evidence for this story, which suits Erasmus's own preference for unworldly scholarship, and such short stays in Oxford were common. More studied law first at New Inn (c. 1494) and then Lincoln's Inn (1496) (Ackroyd 1998; House 2004).

Legal Studies, Humanism, and the Charterhouse

The years after Oxford were a time of intense intellectual activity. More came into contact with leading scholars of the new learning, John Colet, William Grocyn, and Thomas Linacre, and

through them with wider European intellectual life. All these men had travelled to Italy and come into contact with the revival of Greek studies. A common pursuit was renovation of theology through the recovery of original texts of the scriptures and patristic writings. The English humanists were equally committed to the application of study to practical affairs, demonstrated in John Colet's foundation of St. Paul's School (1508–12) and Linacre's work as a physician.

An important addition to this circle was Erasmus, who met More on his first visit to England in 1499. The two became lasting friends. It is a mark of More's connections at the highest level that he was able to take Erasmus to visit the royal children at Eltham Palace. Stimulated by such academic company, More learned Greek, wrote poetry, and lectured in 1501 on St. Augustine's *City of God* in Grocyn's church of St. Lawrence Jewry. His legal career was equally busy; in 1500, he lectured on English Law at Furnivall's Inn and in 1501 qualified as a barrister.

As well as intense study of classical letters, and a busy legal career, More was also drawn to the spiritual life. From about 1500, he lodged in or near the Charterhouse, home to the Carthusian order. According to Erasmus, More considered the monastic vocation himself, only to find fleshly urgings for married life too strong. Whatever the truth of this account, More clearly responded to the pieties of the Carthusians: even after his marriage, he wore a penitential hairshirt. In this period, he sought balance between the active and the contemplative life. One answer lay in the writings of the medieval spiritual writer Walter Hilton (c.1340–1396). In his *Mixed Life*, Hilton explains how an inner life of prayer, study, and devotion can support practical business in the world, where this is directed towards the better governance of the public realm. This model of lay piety helps explain More's direction of his own life and household (Kenny 1983).

1504–1515

More's own practical business included his first appearance as a Member of Parliament in 1504. The next year, he married Jane Colt and they

settled in the Old Barge, Bucklersbury. A daughter, Margaret (1505–44), was soon followed by two other daughters and a son (Guy 2008). In 1505–06, the household was visited by Erasmus. The two men worked on a translation into Latin of the satires of the second-century Greek satirist Lucian. Both More and Erasmus were attracted by Lucian's ironical mode, his puncturing of self-deception and superstition, and his use of dialogue. The resulting volume was published in Paris in 1506. The example of Lucian was an important influence on Erasmus's *Praise of Folly* and More's *Utopia*.

In 1509, Henry VII died, and Henry VIII acceded to the English throne. Erasmus and others greeted the cultivated young monarch as a friend of learning. More's own commemorative verses on the coronation were presented to the king. In the same year, More was admitted as a member of the Mercers' guild, whom he was able to advise as an expert in commercial law. In 1510, More published a translation into English of a Latin biography of the Florentine philosopher Pico della Mirandola, by Pico's nephew Gianfrancesco, *The Life of John Picus Earl of Mirandola* (Cousins and Grace 2009, ch. 5). As a pious layman who did not take monastic vows, Pico spoke to More's own spiritual history; as a scholar withdrawn from worldly concerns, he represented a path More did not take and has something in common with the fictional Raphael Hythloday, visitor to Utopia. In the same year of 1510, More was also the dedicatee of one of the most famous Renaissance works, Erasmus's *Praise of Folly*. Work on this was started in More's own house in 1509, and its original Latin title, *Encomium Moriae*, plays on his name. This work's ironic tone, vivid style, and vision for ecclesiastical reform echoes the conversation of the two men and their circle of humanist friends.

In 1511, More's wife Jane died. Within a month, compelled by the practical needs of a busy household, More married Alice Middleton, widow of John, a London merchant. His life over the succeeding years brought experiences which inform *Utopia*. As undersheriff of London he presided over the sheriff's court. This gave him a

direct insight into London's social problems (later to be anatomized in *Utopia* Part One). Meanwhile, the king disappointed early promises of a cultural dawn. Inspired by his forebear Henry V, he was now in ardent pursuit of martial glory and invaded France in 1513. This belligerent act prompted Erasmus's antiwar tract *Dulce bellum inexpertis* ("how sweet war is to the inexperienced") and antimilitaristic epigrams by More himself.

In c. 1513, More started his *History of Richard III*. This was composed in Latin and English (the versions are not identical). The author's purpose in writing it is not clear, though it is clearly moral in intent and ornately rhetorical in composition. While the subject is historical, the treatment is not. *Richard III* presents a deeply pessimistic portrait of power and corruption. It is written in the register of classical historians, with set-piece speeches in the manner of Thucydides, Tacitus, and Sallust, and has attained a particular significance as an influence on Shakespeare's play, depicting Richard as a physically and morally deformed child-killing monster. More continued to work on this until c.1519, when it was left unfinished. Perhaps in its picture of recent history, it was too incendiary for publication. More's *Richard III* was started at the same time that Machiavelli wrote *The Prince* (though the latter was not published until 1532). Both portray a modern political world in which the ancient Christian and classical virtues are under severe strain (Logan 2011, ch. 8; Wegemer 2011).

1515–1516: Utopia

In May 1515, More was sent to Bruges to negotiate trade with the Flemish. His companions in the delegation included Oxford contemporary, churchman, and administrator Cuthbert Tunstall. In July, a lull in the proceedings allowed More to travel. In Antwerp, he met the learned town clerk Peter Giles and started work on *Utopia* – or, in More's title, *Nusquama*.

From Erasmus's account, accepted by scholars, the second part of *Utopia* was written first. This is the description of the island of Utopia itself, as described by the traveler Raphael Hythloday. The journey to the island (which some early readers took to be real) supposedly took place following

Amerigo Vespucci's fourth voyage in 1504, and More's *Utopia* is inflected by contemporary ideas of how a society might evolve under natural law, without the elaborations of European society. Utopia, "No-where," is characterized by what it is not. It is a society which is untouched by the sins of pride, flattery, and deception – vices which provide the source of evil in *Richard III*. Here, without any acquisitive sense, the inhabitants inhabit identical houses and work for the common good for 6 hours a day, devoting the rest to the leisure pursuits of the ideal humanist – reading and attending lectures before breakfast. Work and leisure are pursued by men and women on equal terms. Craft and industry are honored, agricultural work is done by rotation of city dwellers spending time in the countryside, and, most strikingly of all, there is no private property. All goods are held in common. Money does not exist. Gold is held in contempt as a useless metal, and used for prisoner's chains and chamber pots. All utopians wear plain working clothes. Through a system of representative government, the just rule of a philosopher-king is assured. Indeed, it was under the enlightened dictatorship of the first ruler, Utopus, that a channel was dug separating the island from the mainland and assuring its rapid evolution untainted by contact with the wider world. In its crescent shape and size, Utopia resembles Britain. Its language, of which we are given an example in prefatory material, is similar to Greek.

Utopia raises one immediate question: does the author mean us to admire the land Hythloday describes? Is Utopia More's picture of the ideal state? The title page, *De optimo reipublicae statu deque nova insula Utopia* (On the best state of a republic and the island Utopia), announces the theme unambiguously. But More distances himself from direct endorsement of Utopia's arrangements by putting the description in the mouth of Hythloday and placing himself in the work as a skeptical listener. At the conclusion, "Morus" states "When Raphael had finished his account, I was left with the sense that not a few of the practices which arose from Utopian laws and customs were patently absurd" (*Utopia* 2012, 122). But he does not expand on this critique, leaving

readers to continue the dialogue among themselves.

Nonetheless, *Utopia* reflects important aspects of More's thinking. It represents a society in which private virtue is integrated with the political life. The Utopian state provides a vehicle for the enactment of philosophical ideals in the public sphere. The mixed life commended by Hilton is embodied in a people who pursue with equal zeal the cultivation of the mind and the good of the wider community. The Utopians are also remarkably keen on Greek, which Hythloday introduces them to, and as model humanists are less interested in the niceties of abstruse logic. Though they have not yet received the truth of Christian revelation, they have intimations of a divine presence and are enthusiastic to learn more about Christianity from Hythloday and his companions. In their diligent search for truth, they seem to be depicted as superior to the Europeans, whose profession of Christian piety and charity is pure hypocrisy. The state of Utopia stands as a satire of the European love of profit and the high status accorded to magnificent and practically useless individuals.

At the same time, Utopia is open to criticism. More's training as lawyer and rhetorician involved being able to argue both sides of a case convincingly, and there is a potential critique of Utopia embedded within the ostensibly enthusiastic description. Its name, whether Latin *Nusquama* or Greek *Utopia* (which seems to have been added by Erasmus), stresses it as a nonentity. It is "nowhere," its river "Anydrus" means "no water" and Hythloday's name suggests "distributor of nonsense" (a response, perhaps, to the narration of Folly in Erasmus *Praise of Folly*). The strain of classical wordplay acts as a reminder of the impossibility of this fantastical island. There are aspects of Utopia which More the author cannot have approved of, such as a general philosophy of hedonism, the relative ease of divorce, the sanctioning of euthanasia, and, as noted above, a remarkable tolerance in religious beliefs. These have been attributed to the Utopians' quasi-prelapsarian state of nature, before Christian revelation. Certain aspects are comically bizarre, such as the inclusion of entire families on the frontline in war, while the absence of lawyers –

in a likely in-joke by lawyer More, the Utopians prefer to plead for themselves – leaves unexplained how the complicated system is enforced. Utopia is sometimes held up as a liberal paradise in contrast to the intolerance of More's religious polemics. Yet it represents more clearly the triumph of collective order: the inhabitants of Utopia have no privacy, dress alike, and have no semblance of personal identity. All is subordinated to the march of the collective will.

A second question which has prompted debate over *Utopia* is: how seriously are we to take it? Those closer to More's time described it as a "iollye invention" (Harspfield, in Roper and Harspfield 1963) and as an example of "feined narrations and wittie invented matters" (Thomas Wilson; see Lewis 1954, 167). Yet More was not given elsewhere in his work to write for mere diversion: rhetoric may be delightful but it is directed towards the end of improvement. Some early critics, such as the socialist Kautsky, saw in Utopia an argument for a communist state as an answer to the ills of the modern "developed" world, and a recent study views it as a seriously intended contribution to social reform (see Wilde 2016). *Utopia* might be described as a kind of serious play. It employs humanist devices of irony, wordplay, the pleasant inventions of invented maps and alphabets. The mode of satire points this verbal play towards the moral purpose of identifying the ills of modern European society, which More as undersheriff knew at first hand. *Utopia* exemplifies in lucid prose the author's belief in the duty of scholars to use literature to urge reform on political and spiritual levels.

Soon after writing the description of Utopia itself, More added what is now presented as the first book, the so-called "Dialogue of Counsel," in which a figure "More" meets Hythloday, who expounds to him a conversation he had at Morton's court regarding the punishment of thieves: hanging, argues Hythloday, is both ineffective – the problem of robbery continues – and unjust, since it ignores the social causes of crime. The economy, Hythloday points out, is burdened by ex-soldiers and useless former retainers; and formerly common land has been greedily enclosed by the rich, taken out of production for

the pasture of “man-eating” sheep, which are sold at artificially high prices for private profit. Destitute farmers are forced into robbery as the only means of support left to them. This astute analysis of contemporary ills leads More to entreat Hythloday to put his counsel at the service of a king. But, in a *locus classicus* for More and other humanist scholars (see Skinner 1987), Hythloday prefers to retain his independence as a seeker after truth rather than to have his ideals compromised in the world of political affairs. More himself follows Cicero in espousing the duty of the intellectual to advise, even where that means accepting that ideals will be compromised and the task becomes one of influencing policy so that at least it does the least possible harm. In an image borrowed from Cicero’s *De officiis*, he argues that the actor must suit himself to the part provided. Hythloday rejects this advice, and Book Two ends similarly, with “More” unconvinced by Utopia. In particular, he questions the absence of money, which deprives public life of ceremony and magnificence (Skinner 1987; Baker-Smith 2014).

1517–1519: Defense of Humanism

More completed *Utopia* in London, in the spare moments he could find after his return from the Netherlands, and sent the manuscript to Erasmus in September. After Erasmus had added his own editorial touches – including the title – it was published, with illustrations and an apparatus of letters and verses, in December 1516 by the printer Thierry Martens in Louvain. A second edition followed in 1517 (Paris), a third in 1518 (Basle), and two further prints in 1519 (Venice, Basle). In 1516, Erasmus published his own treatise on education and statecraft, *Institutio principis Christiani* (On the Education of a Christian Prince). Both texts seek to integrate the philosophy of antiquity and Christian ethics, and assert the value of training in classical rhetoric as a grounding for ethical conduct and the management of practical affairs.

To this period belongs the first in a series of letters in which More writes in support of the study of Greek and the humanist project in general. The immediate occasion for this was the publication in 1516 of Erasmus’s *Novum*

instrumentum, his edition of the New Testament, correcting St. Jerome’s Vulgate text against a study of the original Greek. This work aroused a strong reaction from theologians, among them Martin van Dorp of Louvain, who criticized Erasmus’s irreverent treatment of St. Jerome and his apparent elevation of philology over the higher truths of theology. These criticisms were put in the form of a letter to Erasmus and, having been shown their correspondence, More wrote his own in response.

The *Letter to Martin Dorp* is a defense of humanism, in the sense of a diligent study of classical and Christian texts (the scriptures and the patristic writings of the Church Fathers), in the original languages, with close attention to details of spelling and grammar. In the humanistic program, the scholar should also imitate the style of original authors and so embody their spirit. Through this return to the original text, earlier translations like Jerome’s, and much intervening commentary, could be seen to be in error; the reader could meet the great texts face to face rather than through second-hand glosses and scraps in compilations. A key principle was that private study has an ethical benefit; as Seneca formulated it, the liberal arts prepare the soul for virtue, and hence to good works in the public realm (as it does in Utopia) (Skinner 1988).

For More, the scholastic theology represented by Dorp (who was not without humanist sympathies) clouds this key issue of personal and social reform. The scholastic tradition has put too much weight on dialectic in the trivium. It has trained the intellect with its “supersophistical scholarship” (Works 15.27) and in so doing has created a hermetic language of rarefied subtleties which turns the mind away from the world. More argues for a greater emphasis on rhetoric: as a form of language directed towards persuasion, rhetoric goes out into the world. It seeks to address the will as well as the intellect and to move the listener to ethical action. The student of rhetoric will find it not only in academic texts but in the whole field of humane letters, including history and oratory, all of which provide instruction in the nature of man. Without rhetoric, scholastic theology becomes an arid exercise for its own adepts, of

no benefit to pastoral care or virtuous conduct. Unlike scholasticism, rhetoric is grounded in common language and thus in the experience of human history. Defending Erasmus's correction of Jerome, More argues that while a single Church Father may be liable to error, the Fathers as a whole represent a collective authority for the body of the whole Church. Philology and rhetoric recover the original meanings of the classical authors and Fathers, integrate classical and Christian teaching, and elevate the student to the virtuous life. These principles of humanism, which were ultimately accepted by van Dorp, are rehearsed in other letters: to the University of Oxford, supporting Greek studies (1518), to Edward Lee, and to "a Monk" (identified as John Batmanson) in 1519–1520.

1518–1529: Royal Councillor: Anti-Reformation Polemics

In *Utopia*, the fictional More urges the skeptical Hythloday to become a councillor and adopt a practical philosophy "which knows its stage and adapts itself to the play in hand" (*Utopia* 2012, 49). In 1518, the real More put his abilities at the service of the crown, through admission to the King's Council. The council was run directly by Cardinal Wolsey from Westminster Hall. More himself spent most of his time attending on the king and was so popular with the royal couple that he rarely had time to see his family. He was also heavily involved in framing responses to the heresy, as he saw it, of the Lutheran Reformation (Wegemer and Smith 2004, ch. 5; Baumann 2015). In 1521, he played an editorial role in Henry VIII's *Defence of the Seven Sacraments* against Luther. Luther's response to this was so indecorously combative that the king could not with dignity reply directly. This was left to More, who wrote *Responsio ad Lutherum* (1523), combining the highly personal attacks characteristic of religious polemic with a demolition of Luther's doctrine of *sola scriptura* and defense of the validity of the Church authority deriving from tradition. The aggressive tone of the polemics arguably points to a weakness in More's adherence to humanist rhetoric. Rhetoric carries with it no moral compass and directs itself emotionally as

much as intellectually at the audience. While dispensing with the dry logic of scholasticism, it also casts itself adrift from the academic courtesies within which scholastic argument was framed. Without the impersonality of logical structures, polemic finds itself in *ad hominem* attacks.

The argument continued with the *Letter in Reply to Martin Luther* (1526). In 1528, More was licensed by Cuthbert Tunstall, now Bishop of London, to read heretical tracts for the purposes of confuting them, a mission which yielded *A Dialogue Concerning Heresies* (1529). This is more agreeable to the modern reader; in it, More returns to the dialogue form and has an older speaker expound orthodox doctrine to a sincere young interlocutor, "the Messenger," who reports Lutheran doctrines only to have them sagely refuted. Besides Luther, another adversary of More's was William Tyndale, who started printing his English translation of the New Testament in 1525, copies of which started arriving in England in 1526. In 1532 and 1533, More published in two parts *The Confutation of Tyndale's Answer*.

As well as writing polemics in defense of Catholic teaching, More played an active part in attempting to stop the flow of books of reformation theology and to extirpate the Lutheran "heresy." He was closely involved in the arrest of six heretics and in the execution of three of them. This, and the violent language of much of the polemical writing, is the most controversial aspect of his career today. More certainly acted on conviction. He believed the ideas of Luther posed a mortal challenge to Christendom and the social order on which it relied. The Church included saints and sinners, the living and dead, and represented a *consensus fidelium*. Guidance came from the Holy Spirit working on this body as a whole, through the frail vehicle of its members as a communality. Luther's position that the Spirit could work on the individual believer, outside the community of the Church in time, represented an attack on that community. More also argued against the doctrine of predestination, asserting that it was effectively a license for the individual to behave as he pleased; the Peasants' Revolt of 1525 and Sack of Rome of 1527 heightened the fear that the further proselytizing of

reformist ideas in England would lead to social breakdown. The polemics have not been regarded as novel or significant by theologians. Biographers have pointed out that they were commissioned works, written in an often coarse vernacular in order to reach an uneducated readership. The persecution and execution of heretics, for which More himself was unapologetic, have been interpreted as rigorous but within the law; others have described More as far more actively zealous than his predecessor Lord Chancellor Wolsey (see Ridley 1982; Guy 2000).

1534–1535. Last Years: Devotional Writings

In July–August 1529, More was present at the Treaty of Cambrai, a peace treaty between France, Spain, England, and the Holy Roman Empire. In October, Wolsey was dismissed as Lord Chancellor, for his failure to provide Henry with his desired divorce. More was appointed to this office, in which he sought to effect reforms of legal practice, and exemplified in his own judgments a strict impartiality. In 1531, Henry VIII required the Convocation of Canterbury to grant him the title of “Supreme Head of the English Church,” with the qualifying clause “as far as the law of Christ allows.” In 1532, More resigned the Chancellorship pleading ill health but evidently feeling ill-fitted to serve the king in the break from Rome. After his resignation, he continued to expend effort on further anti-Reformation polemics (the Letter against Frith, on transubstantiation (1532–1533); the *Apology* (1533), *Debellation of Salem and Byzance* (1533), and *Answer to the Poisoned Book* (1533)). The Submission of the Clergy in 1532 saw effective government of ecclesiastical matters in England pass to the crown. The central issue for which More went to his death was the Act of Succession (1534). In this, the king’s marriage to Katharine (formerly married to his brother Arthur) was declared null. But since this marriage had been made possible by a papal dispensation, the undoing of that dispensation amounted to a declaration that the secular monarch had the power to overrule papal authority, in which, as More held, God’s law was invested. Equally, the king had no power to proclaim himself Head of the Church in England,

a position Henry now insisted on without the saving clause mentioned earlier. More declined to attend the coronation of Anne Boleyn in 1533.

Having refused to take the oath now demanded in support of the Act of Succession, More was sent to the Tower of London on 17 April 1534. There he wrote the devotional works *Treatise on the Passion*, *De tristitia Christi* (On the sadness of Christ), and *A Dialogue of Comfort Against Tribulation*. This latter book, his most popular after *Utopia*, is set in Hungary in the years 1527–1528. An elder man (Antony) and a younger (Vincent) await persecution by the Ottomans who have invaded their country. In this projection of his own situation, More voices through Antony the acceptance of suffering for a higher good, in the face of the doubts of the younger man (More must himself have contemplated torture and the living disembowelment meted out to the king’s enemies) (Logan 2011).

Through this work, and his final correspondence, More examines the issue of personal conscience. He was himself accused – by his wife Alice among others – of being proudly scrupulous in his refusal to take an oath to which many other wise churchmen had subscribed. For More, conscience was an instrument for the discernment of God’s law. Conscience may be mistaken, and so must be continually informed by reading, study, and reflection. For More’s conscience, the king’s over-ruling of Church law was an impossibility: the secular realm cannot legislate above the sacred. The body of the Catholic Church is indivisible. He admits other men’s consciences may guide them differently, but matters of conscience cannot be decided by popular vote. As a lawyer, he never gave in public his reasons for refusing to swear: to do so would be treason, while silence under the law implies consent. Furthermore, a deliberate act inviting condemnation could be seen as suicidal, and martyrdom, he believed, should not be actively sought: God, not man, chooses the end of a life. These were the grounds set out in his trial at Westminster Hall on 1 July, at which he was convicted of treason. The usual punishment of hanging, drawing and quartering was commuted by the king to beheading on the grounds of More’s noble status (he had been

knighted in 1521). Sir Thomas More was executed on Tower Hill on 6 July (Chambers 1935; Ackroyd 1998; Guy 2000, 2017).

Heritage and Rupture Within the Tradition

More's thinking follows medieval traditions. The poignancy of his life lies in the fact that he defended the old order at a time when it was being unsettled from different directions: Columbus's travels in 1492; the geopolitical unrest caused by the newly asserted powers of France, England, and the Holy Roman Empire; and the radical break of the Reformation.

In his spiritual life, More was devoted to the Catholic Church of medieval Christendom. While conscious of the venal aspects of the ecclesiastical establishment, More believed the community of the Church was the vehicle for the Holy Spirit on earth, one which might be reformed from within but would be broken from without by Luther's attack on the sacraments. Reform from within was to be aided by the "positive theology," which took the direct words of Christ and the Fathers as the most reliable guide for Christian practice and pastoral care. While he confuted Tyndale, More was sympathetic to the idea of a translation of the Bible but believed it should be distributed by the Church to those best fitted to interpret its teachings properly – a conception of humanism operating under the management of a suitably educated elite.

More's religious polemics, in their zealous defense of orthodox dogmas, convey an attitude at odds with the common notion of "Renaissance." He regarded Reformation ideas in the same way an educated person would regard racist bigotry today: a disordering of the will and a threat to civilized society. More's final defense of papal authority should not be confused with the veneration of the personal figure of the pope which is common today. His allegiance was to the office, rather than the person.

In his professional life, More's heritage was the common law of England. As Lord Chancellor, he accelerated the hearing of cases and urged judges

to exercise care and discretion in their rulings, not simply to rely on a strict interpretation of legal precedent. The first part of *Utopia* addresses the issue of a legal system unfitted to deal with the social problems of the time. His most evident rupture with intellectual tradition lies in the letters defending Erasmian humanism, and the emphasis on classical rhetoric over scholastic logic. The liberal arts were regarded not as subjects of interest for their own sake but as a valuable tool in the exercise of public affairs.

Innovation and Original Aspects

Along with scholars like John Colet and Thomas Elyot, More reinvigorated England's intellectual life through the establishment of Greek studies and the application of "the new learning" of humanism. More was also innovative in his belief in the value of women's education, as practiced in his own large household at Chelsea (memorably depicted by Hans Holbein). As a stylist in English, More has also been regarded as innovative; his best English writings combine the embellishments of rhetoric with concrete and earthy colloquial phrases to achieve a memorable voice.

Undoubtedly, it is *Utopia* which stands as More's most original work, though it, too, belongs to a classical tradition of works on political philosophy going back to Plato. Scholars have placed it in a tradition of humanist treatises on good government. In its first part, *Utopia* presents an account of crime as having social causes, for which a socially effective solution is necessary – a challenge to notions of justice grounded on precedent rather than attention to the particular case. Through the character "More" the author argues that thinkers should serve as councillors, a principle of civic humanism cruelly ironic in the light of his own fate. The description of *Utopia* itself draws on current thinking about the state of nature, stimulated by discoveries in the New World, and achieves an exhilarating speculative freedom in its survey of a number of social and political concerns. The treatment of these ideas through ironic and playful dialogue, rather than

earnest and schematic argument, has made the work perennially popular.

Impact and Legacy

More's death made an immediate impact on the rest of Europe. According to Roper's biography, the Emperor Charles V told the English ambassador Thomas Elyot of the execution before Elyot knew of it himself and said "We would rather have lost the best city of our dominions than have lost such a worthy councillor" (Roper 1963, 50). On the continent, More was soon recognized as a martyr, while the early biographies of Roper and Harpsfield, circulated privately, enlarged the picture of the brilliant and saintly More, the man praised by Erasmus as "man for all seasons" (*vir omnium horarum, Praise of Folly*). This phrase was taken up by Robert Whittington in a Latin Grammar of 1520: "A man of angel's wit and singular learning: I know not his fellow. For where is the man of that gentle-ness, lowliness and affability? And as time requireth a man of marvellous mirth and pastimes: and sometimes of as sad gravity. A man for all seasons." The image of the saintly More was imprinted on popular consciousness in the play *A Man for All Seasons* by Robert Bolt (1960; filmed in 1966). This picture edits out More's committed persecution of heretics. A different portrait is given in Hilary Mantel's novel *Wolf Hall* (2009). Here More is portrayed as a humorless fanatic. Both modern renderings highlight the problem of recovering the inner person of someone even his family found frustratingly enigmatic; they also highlight the distance between the modern picture of conscience as a kind of irreducible personal will, and More's own conception of it as a deliberative instrument for the discernment of divine law. More was canonized by Pope Pius XI in 1935 and pronounced patron saint of politicians by Pope John Paul II in 2000 (Guy 2000).

More's writings were published on the continent while they were still suppressed in England. Among them, *Utopia* has had by far the greatest legacy. As a work of utopianism, it lies behind later exercises in the genre like William Morris's

News From Nowhere (1890). As a work of satirical fiction, it points to Swift's *Gulliver's Travels* (1726), Samuel Butler's *Erewhon* (1872), and in its picture of identical clothes, houses, and collective routines of work, it could even be compared to the depersonalized dystopia of Yevgeny Zamyatin's *We* (1921). While scholars are able to place *Utopia* in a context of classical and humanist writings, in popular perception the book fits most comfortably into the satirical utopian/dystopian genre. It is appropriate that an edition commemorating the 500th anniversary of its publication carried an introduction by the science fiction writer China Miéville and essays by the fantasy novelist Ursula le Guin (London: Verso, 2016). As a blueprint for society, *Utopia* is striking but too fantastical to be credible; as a satirical mirror to the vices of More's Europe, it still carries force, and as a work of the imagination, it is a book for all seasons.

Abstract

Judah Moscato was a Jewish Renaissance philosopher, whose writings combine the richness of the Jewish tradition of Bible, Talmud, philosophy-theology, and Kabbalah with neo-Platonic imagery then popular in Italy, especially in Florence. While his works treat numerous themes, including music, rhetoric, Jewish holidays, among many others drawn from Jewish texts, he saw himself primarily as a philosopher striving for intellectual perfection by uncovering elusive Platonic ideas from under various kinds of imagery. Like Marsilio Ficino and Georgio Veneto before him, Moscato used such neo-Platonic imagery to treat a vast number of subjects, including especially the mythologies of Jewish literature, as philosophical subjects with hidden intellectual meaning. Moscato also seems to have been influenced by Ficino's notion of a *prisca theologia*, reflections of which appear in various traditions. Indeed, his meandering writing style that moves seamlessly between Jewish and classical Greek, Latin, and Italian sources

reflects an openness to receiving truth from diverse sources. His interest in and promotion of Judah Halevi's *Kuzari* helped propel that book, which is itself heavily Platonic, to the forefront of Jewish learning for hundreds of years to come.

Biography

Moscato is known as a communal leader, preacher, Rabbi, and scholar of Mantua prominent in the Jewish community during the years 1564–1590. Little is known about his early years, but he must have acquired a broad education in Jewish texts of all periods as well as classical philosophy, music, rhetoric, and literature. His rise to eminence in Mantua came after his flight from the Ancona region in the wake of persecution of Jews. In Mantua, he was taken in by the family of a Mantuan banker, Salvatore Joshua Minzi-Berettaro, whose son, Samuel, he befriended, perhaps tutored, and whose daughter he married. Moscato also entered into various business ventures with his father-in-law, through which he attained financial independence. It is not clear whether Moscato held an official, paid Rabbinic position in Mantua or an honorific title allowing him intellectual and legal independence from the Jewish communal offices. He seems to have held an official title of “Our Teacher and Rabbi” from 1587 and to have headed an academy, probably a gathering of senior scholars rather than a *yeshibah* for youth, known as the *wa'ad haḥakhamim* of Mantua. Moscato's esteem in the eyes of the community and quite possibly his personal wealth allowed him to assume positions of leadership, such as guaranteeing monetary transactions through the Jewish courts and advocating on behalf of Jews before Italian government officials. In one case, Moscato was part of a group of prominent Jewish figures who

successfully convinced the duke of Mantua, Guglielmo Gonzaga, not to enforce Pope Gregory XIII's 1581 bull prohibiting, *inter alia*, Jewish physicians from treating Christian patients. However, Moscato's dealings with Duke Guglielmo were not entirely positive. In 1587, Moscato was jailed for his role in persuading a prominent Jewish court musician known as Abramino dell'Arpa (also known as Abramino Levi) not to convert to Christianity. Abramino, along with his uncle, did convert, apparently under torture, but Moscato held fast under intense psychological pressure. Moscato was released a few months later when the duke died. Moscato apparently spent his remaining years preparing his two major works *Nefuṣot Yehudah* and *Qol Yehudah* for publication. The former was printed about a year before Moscato's death and was accompanied by elaborate, innovative indices and followed by a list of corrigenda, reluctantly included by the printer at Moscato's insistence. Moscato did not live to see his *Qol Yehudah* in print and the subsequent revival of interest in Halevi's *Kuzari* that it brought about.

Works and Themes

Moscato wrote two major works: *Nefuṣot Yehudah* (“The Dispersed of Judah”) and *Qol Yehudah* (“The Voice of Judah”). *Nefuṣot Yehudah* is a collection of 52 sermons in elaborate Hebrew each of which treats one major theme but meanders into numerous subthemes dealing with both Jewish and classical notions and texts. A typical sermon begins with a quote from the Bible, usually from the Pentateuch, and then relates an apparently unrelated midrashic passage. The greater part of the sermon will bring more passages and more Biblical or Talmudic images, occasionally and irregularly referring back to the initial quotes, interpreting and reinterpreting them in light of other insights. These insights generally also take the form of interpretations of other passages or images that appear in canonical Jewish or classical works. Moscato moves fluidly and seamlessly from image to image, from passage to passage, all the while drawing on any materials that

can conceivably be lent to support his interpretations. While Moscato sometimes disagrees with and even criticizes his sources, his work is for the most part free from polemics; his use of sources is to support his ends, rather than to attack enemies. Accordingly, even the non-Jews who appear in the book speak with a Judaized voice. Thus, Plato, Aristotle, and even Seneca speak in Hebrew phrases taken from the Bible. Indeed, their words are taken to explain the Bible or the Talmud. So too can the words of the Talmudic sages be explained by appeal to treatises on rhetoric by Quintilian and Cicero. Moscato's sermons thus implicitly assume a kind of unity of knowledge which can be expressed by either Jews or non-Jews, but which sees its completion in a Jewish context, even a context of Jewish canonical texts. This knowledge takes the form of literary allusions (*remezim*) to intelligible ones that remain beyond the description of the text of the sermon itself. *Nefuṣot Yehudah* is very carefully written but nevertheless does not purport to be a written work but a spoken work. These lectures are, however, in a Hebrew that is so erudite and intricate that it is impossible to imagine a community learned enough to listen to them. (We might also note that a good number of them are exceedingly long.) These lectures thus straddle the fence dividing writing from speech, interspersing lengthy and intricate discussions that seem suited only for writing, with references to communal and personal events that seem suited only for speaking. This method of writing may reflect a Platonic understanding of an ideal form of oratory that can better lead souls to wisdom than writing alone. Since the intelligible ones that Moscato seeks to point out often defy description, Moscato's ambiguities in speech/writing highlight the inadequacy of both to pure thought.

Moscato's *Qol Yehudah*, published 4 years after Moscato's death, is a lengthy line-by-line commentary on Judah Halevi's *Kuzari* that is the best known and most commonly printed Hebrew commentary on the *Kuzari*. Indeed, it was the only Hebrew commentary on the *Kuzari* in print until the end of the eighteenth century. Halevi's *Kuzari* is an account of a conversation between an ancient king of the Khazzars and a Jewish scholar, during

the course of which the king converts to Judaism. The conversation opens with a visit from a mythical philosopher whose positions continue to challenge the interlocutors even after the king dismisses him after two relatively short speeches. As in *Nefuṣot Yehudah*, Moscato emphasizes the importance of intellect and theorization throughout the *Qol Yehudah* and apparently views the work as an elucidation of the comprehensive philosophy contained throughout the work and in Judaism as a whole. *Qol Yehudah* is encyclopedic in scope, if not in organization, and Moscato uses Halevi's many and diverse topics as a springboard for detailed examinations and wide-ranging accounts of other opinions. In *Qol Yehudah* Moscato cites at least 140 authorities, including Jewish, classical, and renaissance Italian thinkers. The dialogue *Kuzari* is quite Platonic in character and thus provides many opportunities for Moscato to present his Neoplatonism. This is especially evident in his discussions of the role of religious imagery and the human as a microcosm reflected in the Temple service.

Abstract

Rabbi Moses of Narbonne (frequently referred to as Moses Narboni or the Narboni) was a Jewish Averroist philosopher. He was most known for his radical naturalist position, especially his belief in the eternity of the world and

his metaphorical interpretations of various Biblical passages. The bulk of his works are commentaries on philosophical writings of other philosophers. His most important philosophical book was his commentary on Maimonides' *Guide of the Perplexed*.

Alternate Names

Biography

Not much is known about the biographical details of Narboni. He was born in Perpignan in the Kingdom of Majorca. He probably made his living as a doctor. He traveled around the Kingdom of Aragon during the late 1340s and early 1350s and later in Northern Castile. He returned to his city of birth, Perpignan, at the beginning of the 1360s, where he passed away a few years later.

Works: Narboni was a prolific writer. Most of his writings are commentaries on the philosophical writings of other philosophers (or supercommentaries on the commentaries of Averroes on Aristotle). These can be classified into five distinct categories:

- I. Personal treatises or commentaries on the Bible and midrashim: *Pirkei Moshe* (Sirat 1970) and *Ma'amar bi-Behirah* (Treatise on Free Will) are philosophical tracts, as are two commentaries on Lamentations and on *Shi'ur Qomah* (Altmann 1967), an esoteric piece of Hekhalot literature that discusses secret divine names and so-called measurements of the divine body. However, this latter commentary, that done with the definition of divinity, was in fact more a supercommentary on R. Ibn Ezra's commentary on Exodus than an independent work.
- II. Supercommentaries on a number of Averroes' commentaries, including Averroes': abridged ("middle") commentary on Aristotle's *Physics*; commentary and paraphrase of the *Organon*; commentary on the *De Caelo et Mundo*; commentary on Alexander of Aphrodisias' analysis of the intellect; and abridged commentary on the *Metaphysics*. It should be noted that although his book *Shelemut ha-Nefesh* (Perfection of the Soul) was written as a treatise, it draws heavily upon Aristotle's and Averroes' views on the soul.
- III. Commentaries on the works of other philosophers: Averroes' astronomical text *De Substantia Orbis*, *Treatise on the Hylic Intellect* (describing its conjunction with the Active Intellect) (Bland 1982), and his *Dissertation on Physics*; Avicenna's *Canon* (part four); Ghazali's *Maqasid al-Falasifah* (The Opinion of the Philosopher); Ibn Tufail's philosophical novel *Hayy ibn Yaqzan*; and Abraham ibn Ezra's commentary on Genesis 11:2.
- IV. Commentaries on Maimonides: one on the *Guide of the Perplexed* as well as a lexicon to the *Guide* called *Peirush mi-Millot ha-Higgayon* (Various commentaries on Maimonides 1961).
- V. Medical works: *Orah Hayyim* (The Way of Life).

The majority of his supercommentaries are extant only in manuscript. Because most of Narboni's writings are commentaries or supercommentaries, and not original thought per se, it can be challenging to discern when he is explaining his own opinion and when he is only explaining the beliefs of a philosopher whom he is commenting on.

Philosophical Opinions (Hayoun 1982): Narboni was well known for his radical naturalistic positions, i.e., his belief in the eternity of the world and his metaphorical interpretation of some of the most important stories of the Bible. He reveals his opinion most clearly in what is arguably his most important philosophical work, his commentary on the *Guide of the Perplexed*, wherein he interprets Maimonides as a very radical naturalist thinker. For example, as against the literal interpretation of the *Guide*, he interprets Maimonides as rejecting the creation of the world. According to Narboni, Maimonides said that he believed in creation for purely political and pedagogical reasons. Narboni even contends that

Maimonides was an unbeliever in the revelation at Sinai who in reality understood this particular Biblical story as a parable for the intellectual perfection of Moses.

Abstract

Moshe ben Yitzḥaq (in Italian Mosè di Gaio) of Rieti (1388–before 1466) was a poet, philosopher, and physician. His main work is *Miqdash me'at* (*Little Sanctuary*), a Hebrew poem of about 5000 verses explicitly inspired by Dante's *Divine Comedy* for its metrical structure and for the description of a supernatural journey. The poem is at once an encyclopedia

of Jewish and secular sciences, a description of the "Jewish Paradise" and a history of Jewish literature, from the Bible to the author's time. *Miqdash me'at* is organized according to the three sections of the Temple of Jerusalem, of which it aims at being a poetic substitute.

Probably influenced by the school of the Roman philosopher Yehuda Romano (thirteenth-fourteenth centuries), Moshe of Rieti complains, in *Miqdash me'at* and other works, both in Hebrew and Italian, for the loss of the knowledge of religious truths and invokes a divine illumination in order to restore that knowledge. His writings reflect the transition between the so-called "medieval" world (his authorities are Aristotle and Maimonides) and different perspectives expressed with neoplatonic and cabbalistic concepts.

Very popular among Italian Jews until the beginning of the seventeenth century, he was subsequently almost completely forgotten until the rediscovery of the Jewish philologists in the nineteenth century.

Biography

Moshe da Rieti was active in many professions: he was a doctor (an activity for which, as a Jew, he received a special authorization from the Pope), a banker, and a merchant (Esposito 2012); but, most importantly, he was a philosopher and a poet (Guetta 2002). He lived in the regions of central Italy, between Umbria and Lazio, where he was the director of *yeshivot* (advanced schools for Jewish education) in the various places where he lived.

His main work, *Miqdash me'at* (*Little Sanctuary*, Rieti 1851; Bregman et al. 2003), is a poem of about 5000 Hebrew verses in *terza rima* (the meter used in Dante's *Divine Comedy*, to which

the author makes a number of explicit references) with religious, scientific, and philosophical content.

Using a subdivision that corresponds to the different areas of the Temple of Jerusalem, Rieti expounds in the first place the profane or “external” sciences, that is, those of the medieval *trivium* and *quadrivium*. He specifically refers to various ancient Greek thinkers, such as Aristotle, Euclid, Ptolemy, and Porphyry, and Arab (al-Fārābī, al-Ghazālī, Avicenna, and, especially, Averroes) and Jewish (Gersonides) philosophers. But his principal point of reference is Maimonides, the one who – he writes – delimited and “purified” the profane sciences by reconciling them with the *Torah*, thus making them legitimate for the Jews. Among all disciplines, poetry occupies a special place, as it allows the author’s desire (*hesheq*, love of intellectual contemplation) to express itself fully.

Another section of the work includes a description of the Hebrew Paradise, which is reminiscent of Dante in the general inspiration but also in the use of elements drawn from Jewish literary tradition: the souls of the Blessed are those of the prophets and the great masters of the past, in addition to martyrs and children who died before they sinned; his guide to the heavenly journey is his father and master, who is acknowledged only at the end of the encounter. As for the “City of God,” the ideal form perceived in a vision, its houses are the different books of the Bible, and the waters that flow through it are those of oral tradition.

Rieti’s work reflects the transition between the so-called “medieval” world and different perspectives expressed with neoplatonic and cabalistic concepts, mystical visions, but also by an intellectual turmoil that pervades all his writings. Among these writings, two must be pointed out: the remarkable *Ya’ar ha-Levanon* (*Forest of Lebanon*) (Guetta 2005) – a lyrical Hebrew poem written in an experimental meter – and a brief treatise in Italian (but written in Hebrew characters) on physical and metaphysical themes, to which the modern editor has given the title of *Filosofia naturale e fatti de Dio* (*Natural Philosophy and Facts of God*) (Rieti 1989).

Whether due to human frailty (because of his limited nature, especially after Adam’s fall) or to the difficulties encountered by Jews in their state of exile, the knowledge of the higher truths is, if not lost definitely, certainly obscured, “as if between me and the light/a cloud functions like a screen” (Guetta 2004). In this aspect, he was probably influenced by the school of the philosopher Yehuda Romano (Rothschild 2018).

The responses through which Rieti seeks to alleviate his intellectual discomfort are of a prophetic-allegorical nature – such as the vision of the Heavenly Temple and its metaphysical connotations – or they consist in the reconstitution of the Jewish intellectual history, from the era of the Talmud up to his own time. This section has a special historical value, in that the author describes the “ideal” library of an Italian Jewish scholar of the fifteenth century, sometimes mentioning authors otherwise unknown.

Rieti’s poetry is historically important also from a formal point of view, in that it broke with the quantitative meter modeled after the Arab poetry and embraced the syllabic system of Italian versification.

Motion in Renaissance Science

Filip A. A. Buyse
St Cross College, University of Oxford, Oxford,
UK

Abstract

Aristotle’s ideas, and interpretations of them, dominated theorizing about motion during the Middle Ages. However, local motion [*motus localis*] or locomotion was, according to the “philosopher” and his followers, only one of four types of change. In addition to change in location, the Peripatetics distinguished change in substance, in quality, and in quantity. Within these four domains of change, change always requires the existence of a potentiality which can be actualized. During the late Renaissance, however, the peripatetic views on motion were variously criticized, adapted, rejected, and replaced (Bodnar 2016). Generally speaking, the different kinds of change were all reduced to local motion, and one of the key ideas of the new theory of motion was the principle of inertia. First versions of this concept were introduced by Galileo (1564–1642) and later developed by René Descartes (1596–1650) and Isaac Newton (1643–1727). The seeds of this (r)evolution, though, had already been

planted by philosophers such as Johannes Buridanus (c. 1300–1358) during the late Middle Ages, who was himself inspired by the work of John Philoponus (c.490–c.570).

In the geocentric cosmos as conceived of by Aristotle (384–322 BC) and Ptolemy (c.100–c.170), there was a strict, ontological distinction between the sublunary world of change and the celestial world of perfect bodies making perfect, circular motions. However, in 1543, Copernicus (1473–1543) published his *De revolutionibus* which presented a heliocentric model of the universe, supported by Galileo’s telescopic observations. The collapse of the traditional worldview was completed when Newton introduced his notion of universal gravitation.

Heritage and Rupture with Traditions

Toward a New Science of Motion of Bodies

According to Aristotle (1984) and his followers, all bodies move spontaneously toward their natural place. On this view, there are different kinds of natural motion, linked to the different elements of the sublunary sphere. For the elements earth and water, that place is the center of the (geocentric) universe. The natural place of water, however, is a concentric layer around the earth because earth is heavier; it sinks in water. Likewise, the natural place of air is a concentric sphere surrounding that of water; bubbles rise in water. Finally, the natural place of fire is higher than that of air but below the innermost celestial sphere carrying the Moon.

The Peripatetics differentiated natural motions from violent motions, which were determined by causes external to the body. According to Aristotle’s doctrine of motion – which corresponds very well to everyday experience – you not only need a force external to the body to set that body in motion, but you also need an external force to maintain its state of motion. For example, consider a throw after the stone has left your hand. According to this common-sense view, without an external force, there simply would not be any (violent) motion. In that case the body would

move spontaneously toward its natural state: the state of rest.

By contrast, according to the new view on motion – which emerged during the first half of the seventeenth century – there is only displacement or local motion [*locus motalis*], and bodies in motion do not need any external forces to maintain their state of motion. On the contrary, Galileo (1564–1642) gave in his *On Sunspots* (1612) and later in his *Dialogue* (1632) early versions of what later would be known as the principle of inertia (Galileo 1890–1909). More precisely, in his second letter (1612) to Mark Welser (1558–1614), he writes that “if we remove all external impediments, a heavy body on a spherical surface concentric with the earth will be indifferent to rest and motion towards any part of the horizon, and it will remain in that state in which it has been replaced; that is, if it is placed in a state of rest, it will remain at rest, and if it is placed in motion (e.g., towards the west), it will remain in that motion.” However, in this passage, the idea of inertia is applied to rotating bodies and heavy bodies moving freely upon smooth spheres concentric with the earth. In the *Second Day* of the *Dialogue* (1632), by contrast, Galileo applied this idea to the motion of a spherical body on a horizontal plane. In this passage, he explains that a ball in motion which arrives on a horizontal plane will not increase nor decrease its velocity. Neither will it change its direction on the condition that all “external and accidental impediments” are removed. In other words, the moving ball will maintain its uniform motion on condition that there are no external forces exerted on it (Galileo 1890–1909). In conclusion, motion on a horizontal plane is blind motion which is only determined by external instead of internal causes.

However, it is important to note that before Galileo, Simon Stevin (1548–1620) and his student Isaac Beeckman (1588–1637) had already anticipated the Galilean theory of motion. The engineer-scientist Simon Stevens had already carried out experiments with falling bodies and with moving objects on inclined planes (Devreese and Vanden Berghe 2003; Cohen 1992; Stevin 1955–1956). Furthermore, the atomist Beeckman had already formulated in his scientific diary, his

(Beeckman 1939–1953) *Journal*, an early version of the principle of inertia – although he seems to not distinguish between circular and rectilinear motion. However, some of Beeckman’s views on motion (Beeckman 1939–1953; Van Berkel 2013) were transmitted via Descartes who lived for more than 30 years in Holland, where he met Beeckman in November 1618 in Breda. Beeckman also introduced to him Galileo’s new theory of motion.

Six years after Galileo’s *Two New Sciences* (1638) had been published in Leyden, René Descartes (1596–1650) defined in paragraph 25 of the second part of his *Principia philosophiae* (1644) “motion in the strict sense of the term” which he opposed to motion “in the ordinary sense of the term” (Garber 1992). Furthermore, according to Descartes, rest was not just a privation of motion but exactly as motion a relative, positive state. The influential French philosopher defined motion as “The transporting of one part of matter or of one body from the vicinity of those bodies that are in immediate contact with it, or with regards as at rest, to the vicinity of other bodies.” And, in paragraph 37 of the same part of his *Principia philosophiae* (1644), Descartes states – as the first of his three laws of nature – that a body tends to maintain its motion once it is in motion. Furthermore, in paragraph 39 of the same part, he emphasizes in his second law of nature that the motion which is maintained is a rectilinear motion since “all motion is in itself rectilinear” (Descartes 1897).

Isaac Newton (1643–1727) incorporated the Galilean/Cartesian principle of inertia as the first of his three laws of motion in his *Philosophiae Naturalis Principia Mathematica* (1687): “Every body perseveres in its state of being at rest or of moving uniformly straight forward, except insofar as it is compelled to change its state by forces impressed.” Consequently, and against the peripatetic view, an external cause is not necessary to maintain a motion. On the contrary, once a body is in motion (or at rest), it continues to be in motion (or at rest) on the condition that there is no external force exerting an influence on the body in motion (or at rest). Furthermore, the motion is not goal-directed anymore as in Aristotle’s physics. There is no *telos*, no final cause. Indeed, the

Motion in Renaissance Science, Fig. 1

This is a page from Descartes's *Principia philosophiae* (Amstelodami: Apud Ludovicum Elzevirium, 1644) showing the relation between rectilinear inertia and centrifugal tendency

motion itself is blind and solely determined by external causes (Fig. 1).

Medieval and Ancient Seeds of the New Theory of Motion of Bodies

The new theory of the motion of bodies broke through during the seventeenth century. However, the seeds of this new theory – with the principle of inertia as its fundamental new idea – may have been planted in the late Middle Ages by the “impetus theorists,” of whom Buridan (c.1300–1358) was the most popular (Buridani 1970).

In the traditional view, there are two kinds of motions: natural motions and violent motions. For instance, the natural motion of a stone is to fall downward toward the center of the earth. When you throw a stone, by contrast, the stone gets a violent motion caused by a cause which is external to the stone (e.g., your hand). During this motion, the stone does not directly fall downward. Why not? According to the Peripatetics, it is the motion of the air which keeps the

stone moving. During the fourteenth century, however, a new explanation, the theory of impressed force, was defended first by the Franciscan theologian Franciscus de Marchia and subsequently by Jean Buridan (Lindberg 2007). The Frenchman Jean Buridan contested the Aristotelian theory. He argued that it was not the external medium (the air) that was responsible for the persistence of the motion but a property which was imparted in the body and acted as an internal cause at the moment that it was set in motion. Buridan named this property *impetus* and extended this idea to circular motion in the celestial spheres (Weinberg 2015; Heilbron 2015). According to the French priest, the *impetus* was proportionate to the “quantity of matter” and the velocity of the moving body. Consequently, the concept of *impetus* is close to what we understand today as *momentum* (Weinberg 2015). Importantly, according to Buridan, the *impetus* did not diminish spontaneously but only as a result of external factors such as the

motions of the air and gravity, which might oppose the *impetus*. Obviously, the concept of impetus was the first step toward the modern concept of inertia.

In his views on motion, Buridan was inspired by John Philoponus (c.490–c.570) – also known as John the Grammarian or John of Alexandria (Philoponus 1987) – whose work circulated in Greek and Latin translations in Europe. Philoponus’ rejection of Aristotle’s physics (Sorabji 2010) was also a major influence on Galileo. The Neoplatonists rejected Aristotle’s physics and argued that an object continues to move because of incorporeal motive energy [*ἐνέργεια ἀσώματος κινητική*] imparted in it by the mover and ceases the mover when it is exhausted.

Innovative and Original Aspects

New Elements of the New Theory of Motion

Besides the principle of *inertia*, a few other innovative elements were introduced via the new theory of motion. First of all, Galileo introduced the concept of the superposition of two independent motions (Clavelin 1974) when he discussed the motion of projectiles in his *Two New Sciences* (1638). In the *Fourth Day* of this scientific testament, the Italian physicist argued that a projection of a projectile (e.g., a stone) is a combination of two independent motions occurring at the same time, producing a parabolic curve: the vertical, continuously accelerated motion toward the center of the earth and the horizontal, uniform motion.

Secondly, there is the idea of the Galilean relativity of motion (Caffarelli 2009). The consequence of this definition of local motion is that motion is understood as relative toward other bodies or a frame of reference. Consequently, a physical object can be in motion relative to object B but at rest relative to object C. Moreover, it becomes impossible to determine whether a body is in motion or at rest in an absolute sense of the word, because there is always the possibility that the frame or point of reference might be in uniform motion.

Thirdly, Galileo discovered the principle of isochronism. According to legend, the author of

the *Dialogo* (1632) discovered in the cathedral of Pisa that not the mass but the length of a pendulum determines its oscillating time. Christiaan Huygens (1629–1695) found later (Huygens 1986), based on Galileo’s concept of isochronism, the pendulum law. And, in 1665, Huygens discovered the phenomenon of synchronization (Buyse 2017) of the motions of pendulum clocks (Huygens 1888–1950).

The New Theory of Motion of Celestial Bodies

In the Aristotelian-Ptolemaic Cosmos, there were two distinct worlds: the world of the perfect, celestial bodies making perfect circular motions around the center of the earth and the sublunary, corruptible material world (Ptolemy 1984; Copernicus 1978). As the term “cosmos” suggests, the world as it was understood in the Middle Ages was perfectly well ordered with several layers around the earth which stood in the center of that closed cosmos. In 1543, however, Copernicus’ book *De revolutionibus orbium coelestium* was published (Copernicus 1978). This book proposed a heliocentric model of the universe, presented in the form of a mathematical hypothesis. Tycho Brahe (1546–1601), in contrast, proposed a geoheliocentric system in which the earth remained at the center of the cosmos. This conformed to the dictates of the Roman Church that the earth must be located at the center of the universe – but the planets were then assumed to move around the sun as their center of motion, while the sun orbited the earth. In 1609, Galileo completed telescopic observations which supported Copernicanism with his enhanced “Hollandsche Kijker.” However, Johannes Kepler (1571–1630) contested the idea that the planets moved according to circular orbits around the sun and argued that these orbits were ellipses with the sun at one of the two foci. Based on his own measurements and those of Brahe, Kepler discovered his three laws describing the motion of planets around the sun.

Motion and Matter

Robert Boyle (Boyle 1999) gave in the preface of *Some specimens* (1661) a definition of Mechanical Philosophy (or Corpuscular Philosophy) which – generally speaking – reflects very well

how most of his contemporaries thought about motion and matter. In this definition, he stated that (local) motion and passive matter are the only and most general or “Catholic” principles of nature. Consequently, for atomists as well as for Cartesians, all natural phenomena had to be explained in terms of local motion of corpuscles which compose matter.

Before Boyle, Galileo had made clear in the *Assayer* [*Il Saggiatore*] (1623) that a body in itself is a piece of universal matter with only a limited set of so-called primary or mechanical qualities such as figure, relative position, size, and motion. Furthermore, Descartes had defined a body as an extended thing. Consequently, animal bodies, human bodies, vegetative bodies, and non-animated bodies and their motions could – in principle – all be analyzed and discussed in the same way: in the mathematical language of primary qualities. Therefore, as suggested in Boyle’s definition, it became possible to use manmade machines as mechanical analogies for the study of all sorts of motions, including motion generated by nature. Hence, the fundamental distinction between the artificial and the natural – which was

so important in Aristotelian philosophy – disappeared. Inspired by Galilean physics, Giovanni Borelli (1608–1679) applied the new theory of motion to living animals (Borelli 1685). In his *De Motu Animalium*, borrowing the title from the Aristotelian treatise, he relates animals to machines and utilizes mathematics to prove his theories. Therefore, he can be considered the father of biomechanics.

The new theory of motion didn’t only have an important impact on natural philosophy. Obviously, renaissance artists such as Sandro Botticelli (1445–1510), Lodovico Cigoli (1559–1613), and Filippo Brunelleschi (1377–1446) were affected and inspired by this new movement. The new theory also challenged many early modern philosophers to invent a new metaphysics to ground this new physics. Early modern philosophers were challenged to address questions such as: how motion was introduced in the world, whether miraculous motions were possible, whether there existed laws of motion, etc. Moreover, many of these early modern philosophers, such as Hobbes (1588–1679) and Spinoza (1632–1677), were obviously inspired

The Homogenization of the Motions of the Universe

Galileo defined in his *Il Saggiatore* (1623) a body as a piece of universal and eternal matter with

primary qualities that reside in that piece of matter such as size, motion, etc. Importantly, gravity was, according to Galileo, a property inherent to matter, as he makes clear in the second day of his *Discorsi* (Clavelin 1974). Consequently, all bodies were heavy bodies which, by definition, fall toward the center of the earth. Galileo studied falling objects and contested Aristotle's view. For instance,

Aristotle was convinced that motion was impossible in a void. One of his arguments was that the speed of motion is dependent on the density of the medium through which it falls. Consequently, objects would fall in a void with infinite speed. According to Aristotle, this is absurd since it would imply that an object could be in two places at the same time (Lindberg 2007). Galileo, however, contested this theory and defended the idea that falling bodies fall equally fast in a void (Galileo 1960). Moreover, he discovered a relation which is today known as the law of falling bodies.

However, in Galileo's universe there were still basically two kinds of motion: the motion of bodies on earth and the motion of the planets moving, by contrast, in circular orbits around the sun. Johann Kepler (1571–1630) corrected Galileo's views by arguing that these orbits were not circular but elliptical. Isaac Newton, however, unified both motions with the introduction of the universal force of gravitation, arguing that the force which lets an apple fall downward is the same force that is responsible for the motion of the planets around the sun. Newton (2016) also showed that relationships such as Kepler's laws would apply in the Solar System, as a consequence of his own laws of motion and the law of universal gravitation (Kepler 1995).

Abstract

Yomtov Lippmann ben Shlomo Mühlhausen (?–1421) was an influential rabbi in Central and Eastern Europe. He authored a polemical treatise against Christianity entitled *Sefer ha-Nitsahon* (“Book of Victory”) which was widely read by Jews in Europe and known to Christians as well. During the seventeenth century, it was partly translated to Latin, printed, read, and answered by Christian polemicists, who generated a subgenre of polemic literature called “Antilipmanniana.” Mühlhausen was a central figure of a circle of Jewish philosophers who were active chiefly in early fifteenth-century Prague. He was one of the first

Ashkenazi intellectuals who combined Maimonidean philosophy with Kabbalah.

Biography

Only a few details of his biography can be reconstructed. At the end of *Sefer ha-Nitsahon*, Mühlhausen relates a public debate he had with a Jewish convert to Christianity called Peter in 1399/1400. The controversy was followed by a serious persecution: some 80 Jews were murdered according to Mühlhausen's account. The location of this persecution cannot be identified with certainty: some scholars assume it took place in Prague (Kaufmann 1927), others suggest Poland or Lithuania (Breuer 1995), and yet another opinion is that it must have occurred in Bohemia, but perhaps outside of Prague (Limor and Yuval 2004). In 1413 Mühlhausen signed a rabbinic document as a member of the rabbinical court of justice (*beit din*) of Prague. Other members of this court were Menahem Shalem and Avigdor Kara, two other important Jewish philosophers. In 1417 Mühlhausen was in Jena; from 1418 to 1421, he resided in Erfurt. A fifteenth-century Christian source claims that Mühlhausen visited Cracow in 1420 (Kaufmann 1927). He passed away in the summer of 1421 in Erfurt (Yuval 1989).

Works

Mühlhausen's most influential work, the *Sefer ha-Nitsahon*, includes a brief summary of Jewish faith and a detailed refutation of Christian biblical exegesis in the form of a commentary on the books of the Hebrew Bible. In addition to defending Jewish faith, Mühlhausen argued against Christian teachings, such as the doctrine of transubstantiation (Lasker 1984). He utilized philosophical arguments taken from medieval Jewish Aristotelian texts (Lasker 1996). Other works include *Sefer ha-Eshkol* ("Book of the Cluster"), an explanation of the creation story and the vision of Ezekiel on the basis of Maimonidean philosophy and Kabbalah; *Kavvanot ha-Tefillah* ("The Intentions of the Prayer"), a spiritual interpretation of prayer; and *Sefer ha-Brit* ("The Book of the

Covenant"), a kabbalistic commentary on divine attributes. Remarkable is that Mühlhausen endorsed the Pythagorean thesis about the sounds produced by the celestial bodies in spite of the Aristotelian refutation of that doctrine which he encountered in Moses Narboni (ca. 1300–1362)'s commentary on Maimonides' *The Guide for the Perplexed* (Elior 2013).

Legacy

Sefer ha-Nitsahon was widely copied and read among Ashkenazi Jews in the Late Middle and Early Modern Ages. An abridged version forms the kernel of Eizik Tirna's polemical work composed in Brno in the middle of the 1420s (David 2011). The first known Christian response to Mühlhausen's work is a Latin treatise by Stephan Bodeker (1421–1459) of Brandenburg (Kaufmann 1927). After some further references to it during the fifteenth and sixteenth centuries, it caught the attention of Christian polemicists during the seventeenth century. The Hebrew text was printed by a Lutheran theologian Theodor Hackspan (1607–1659), professor of Hebrew at the University of Altdorf in 1644. Some of Hackspan's students published extracts from the work in Latin translation (Kaufmann 1927). A detailed response to Mühlhausen was published by the Calvinist theologian Christian Schotan (1603–1671) in 1659. His "Antilipmanniana" was followed by a number of similar works during the later half of the seventeenth and the eighteenth centuries (Kaufmann 1927).

theology of his time, drawing equally from both Sunnī and Shī'ite theology, both Peripatetic and *ishrāqī* philosophy, and the tradition of theoretical Sufism. Ṣadrā's eclectic use of sources did not prevent him from treating his material in a systematical and conceptually rigorous fashion; indeed, he is a true synthesizer of the most important currents of thought of his time in the sense that his synthesis is a new system of philosophy that would subsequently overshadow the preceding schools in importance. The most prominent doctrinal features of Ṣadrā's philosophy are the theory of the foundationality of existence which entails a reductive explanation of our intellectual grasp of quiddities or essences, and the theory of substantial motion which holds, *pace* the Peripatetic tradition, that motion primarily takes place in the category of substance. These two theories, the composite of which has been characterized as a form of process philosophy, also entail a new concept of the identity of concrete entities, which bears an intriguing resemblance to contemporary four-dimensionalist theories of substance. After a period of more meager influence, Ṣadrā's philosophy was revived by some of the most important philosophers of the Qājār period in the nineteenth century. Today, it provides the foundation for the philosophical curriculum in the Shī'ite seminaries in Qum.

His full name is **Muḥammad ibn Ibrāhīm ibn Yahyā al-Qawāmī al-Shīrāzī**, also known by the honorific epithets Ṣadr al-Dīn and Ṣadr al-Muta'allihīn.

Biography

Born in 1571/1572 to a family that belonged to the scholarly and political elite of Shīrāz, Mullā Ṣadrā enjoyed the best early education his hometown could offer. In addition to the traditional Islamic sciences and the Arabic and Persian languages, this involved the study of the rational

sciences of logic, natural philosophy, and metaphysics. But although Shīrāz was famous for its thriving philosophical and theological scene in the previous two centuries, by Ṣadrā's time the students of the fifteenth and sixteenth centuries masters Jalāl al-Dīn al-Dawānī (d. 1502) and the two Dashtakīs, the father Ṣadr al-Dīn (d. 1497/1498) and the son Ghiyāth al-Dīn (d. 1542), seem to have dispersed. It is therefore likely that for much of his early philosophical instruction, he was an autodidact, thus following the almost topical example Avicenna had set in his autobiography.

At the beginning of the 1590s, Ṣadrā moved first to Qazvīn and then to the new Ṣafavid capital in Iṣfahān, in order to further pursue his studies under the guidance of more capable teachers. This brought him into the circle of the so-called school of Iṣfahān, that is, the famous jurispudent Bahā' al-Dīn al-ʿĀmilī (d. 1621), with whom he studied jurisprudence, Qurʾānic exegesis, and the Shīʿite traditions, and the venerated philosopher Mīr Dāmād (d. 1631), who instructed him in theology and both Peripatetic and *ishrāqī* philosophy. Ṣadrā seems to have been particularly affectionate toward the latter, whom he praises lavishly even after the major philosophical differences, most notably on the question of metaphysical primacy of essence and existence, had erupted between the two.

After his studies, Ṣadrā returned to his native Shīrāz in 1601/1602, only to encounter the vehement opposition and criticism of the intellectual hegemony of the city. In the face of this adversity, he opted for a retreat to the small village of Kahak near the city of Qum, a sojourn that would be prolonged for 6 years. Ṣadrā himself describes this period as a self-imposed isolation of extended ascetic contemplation, clearly modeled on the Sufi retreat introduced into the philosophical practice by Shihāb al-Dīn al-Suhrawardī (d. 1191), that helped him to clarify the central philosophical insights underlying his magnum opus, *al-Hikma al-mutaʿāliya fī al-asfār al-ʿaqliya al-arbaʿa* ("The Supreme Wisdom in Four Intellectual Journeys"). He began writing this monumental work in 1606, toward the end of his retreat at Kahak, and finished it 22 years later in the midst of an

active teaching period in Qum. During this time, Ṣadrā led a migrant existence between his native Shīrāz, the increasingly dear Qum that was home to a successful teaching career, and the capital Iṣfahān.

In 1630/1631, Ṣadrā settled in Shīrāz to accept a teaching position in the recently established *madrasa* of Imamquli Khan (d. 1633), the powerful governor of the province of Fars and possibly an erstwhile student of Ṣadrā's. During this last period of his life, Ṣadrā is also likely to have acted as a jurisprudential consultant. He died in Baṣra in 1635/1636, on the way to a seventh pilgrimage to Mecca.

Mullā Ṣadrā had six children that survived. His three sons studied with him and became scholars in their own right, although what little is known of their activity suggests that they did not share their father's passion for the rational sciences. Ṣadrā's three daughters were also married to his students, but there is no evidence of him having envisaged his progeny as a dynasty of scholars.

Works

The Ṣadrian corpus consists of more than 45 works, which range from multivolume philosophical summae to brief treatises on strictly defined topics. His output can be roughly divided into two main classes.

On the one hand, Ṣadrā wrote a number of works in the so-called Islamic sciences, that is, Qurʾānic exegesis, the Shīʿite traditions, and theological ethics. Among the most important are his four exegetical works, the *Asrār al-āyāt wa anwār al-bayyināt* and the *Mutashābihāt al-Qurʾān* ("The Secrets of Verses/Signs and the Lights of Evidence" and "The Ambiguous Verses of the Qurʾān," both completed between 1631 and 1634), the methodological *Mafātīḥ al-ghayb* ("Keys to the Unseen," completed in 1632), and his incomplete *Tafsīr*. Ṣadrā also composed a voluminous but incomplete commentary on al-Kulaynī's (d. 941) classical *ḥadīth* collection *al-Kāfī*. An interesting perspective on the intellectual polemics of the time is provided by *Kaṣr aṣnām al-jāhiliya fī dhamm al-mutaṣawwifīn*

(“Breaking the Idols of Ignorance, on the Admonition of Sufis,” completed in 1618).

The second class of texts consists of Ṣadrā’s philosophical works. Among these, the uncontested pride of place belongs to the immense *al-Ḥikma al-muta’āliya fī al-asfār al-‘aqlīya al-arba’a* composed between 1606 and 1628. Although its broad scope is modeled on earlier philosophical summae, *al-Asfār* deviates from the classical Peripatetic model by its decisive emphasis on metaphysics and eschatology at the cost of logic and the natural sciences. Moreover, its account of the system of philosophical knowledge is constructed along the lines of four journeys (an ascent to God, a journey in God, a descent from God to creation, and a journey in creation informed by the prior theological and metaphysical ascent), which begin from theology and metaphysics and proceed to natural philosophy and ethics on their basis – in the mirror image of the Peripatetic model that was founded on logic and proceeded from natural philosophy to metaphysics as its crowning effort.

More abridged summae are *al-Shawāhid al-rubūbiya fī al-manāhij al-sulūkīya* (“Divine Testimonies on Trodden Paths,” completed before 1631), the predominantly eschatological *al-Ḥikma al-‘arshīya* (“Wisdom of the Throne,” completed between 1631 and 1634), and *al-Mabda’ wa al-ma’ād* (“The Origin and the Return,” completed in 1606), an early treatise that shows a decisive influence by the Avicennian work bearing the same title and is structured in accordance with its predecessor’s Neoplatonic model of the origination of the cosmos from God and its return to Him. An important philosophical treatise is also the *Kitāb al-mashā’ir* (“The Book of Penetrations,” completed after 1628), a concise work on Ṣadrā’s novel concept of existence. Apart from these original texts as well as a number of minor treatises on assorted philosophical and theological topics such as the nature of knowledge, the relationship between essence and existence, resurrection, and the classical questions of whether the world is eternal or created in time and whether human acts are performed freely or created by God, Ṣadrā composed a number of perspicacious philosophical commentaries. These

include works on the metaphysical section of Avicenna’s *Shifā’*, on Athīr al-Dīn al-Abharī’s (d. 1264) Peripatetic epitome *al-Hidāya*, and on a number of treatises by Mīr Dāmād, as well as a supercommentary on Quṭb al-Dīn al-Shīrāzī’s (d. 1311) commentary on Suhrawardī’s *Ḥikma al-ishrāq*, which is witness to Ṣadrā’s full mastery of the *ishrāqī* tradition. Among his philosophical works, we can also classify expositions of philosophy that adopt a more literary style, such as *al-Maẓāhir al-ilāhiya fī asrār al-‘ulūm al-kamālīya* (“Divine Appearances on the Secrets of Perfect Sciences”), as well as more mystically oriented works, such as the *Iksīr al-‘ārīfīn fī ma’rifat tarīq al-ḥaqq wa al-yaqīn* (“The Elixir of Knowers, on Knowing the Way of Truth and Certainty,” completed by 1621), which is based on an earlier treatise by Afḍal al-Dīn Kāshānī (d. 1214), and the Persian *Risāla-yi siḥ aṣl* (“Treatise on the Three Principles,” composed in the early 1620s).

This heuristic classification notwithstanding (indeed, there are texts that are difficult to fit into either category, most notably Ṣadrā’s surviving poetry and the moralistic treatises directed at the shortcomings of some of the pious people of his day), it is clear that Ṣadrā considered both types of works as constitutive of a single intellectual effort. Although scholarship on his exegetical works and religious commentaries is still in its infancy, it seems evident that they contain plenty of philosophically interesting material.

Heritage and Departure

Ṣadrā is adequately described as having performed the greatest intellectual synthesis of his time, perhaps indeed one of the greatest in all time, from the existing philosophical, theological, and mystical currents of thought. There is nothing unheard of in his eclectic method of drawing equally from both Sunnī and Shī’ite theology (especially prominent are Abū Ḥāmid al-Ghazālī [d. 1111], Fakhr al-Dīn al-Rāzī [d. 1210], and Naṣīr al-Dīn al-Ṭūsī [d. 1274]), both Peripatetic and *ishrāqī* philosophy, and the theoretical Sufism of Ibn ‘Arabī (d. 1240) and his followers, though,

in fact, an unprejudiced approach to the entire range of Islamic intellectual endeavor was quite characteristic of the protagonists of Shīrāzī philosophy in the fifteenth and sixteenth centuries, such as al-Dawānī and the Dashtakīs, with all of whose work Ṣadrā was thoroughly familiar. But Ṣadrā is quite unique in the depth of the conceptual revisions he was driven to make by his heterogeneous sources. Two points in particular bear worth mentioning here, that is, the doctrines of (1) the primacy of existence and (2) substantial motion.

1. The term “primacy of existence” (*aṣāla al-wujūd*) captures Ṣadrā’s unique stand in the debate about which of the two Avicennian principles, quiddity or existence, is foundational for the other. The question does not come from Avicenna, who had introduced the distinction between quiddity and existence merely in order to make sense of the difference between God and His creation in terms of their respective modality of existence; whereas all created things are essences or quiddities that are merely possible in themselves and that require a cause that makes their existence necessary, God’s very essence entails His existence, which means that He is necessary by Himself and not in need of any cause of existence. The later tradition, however, raised the question of whether the two principles are both primitive or whether we can reductively explain one in terms of the other.

In brief, Ṣadrā’s theory of the fundamentality of existence holds that the reality of each individual thing should be described as a unique instantiation of existence, not as an essence *having* existence. The temporal variation of its attributes notwithstanding, the creature is one, not because it has an unchanging essence but because its existence is a single continuity. But existence comes in degrees, and in concrete acts of existence, there are always certain deficiencies or privations which vary through the duration of the act and distinguish them from the pure and perfect existence that belongs to God alone. Our intellects can grasp these deficiencies by

abstracting them from the unity of the original act of existence, thereby translating them to essential and accidental quidditative features, out of which an existing thing is then conceived to be composed. In reality, however, the act and its degree are inseparable, and it is the act of intellectual abstraction that makes a manifold composite out of what is absolutely one. Moreover, it does this by means of universal concepts which can by definition be true of more than one particular act of existence, and this is possible only by neglecting certain aspects of the unique individual act of existence under consideration. In the end, all of the above boils down to the claim that we can reductively explain quiddities as features introduced in the intellectual consideration of metaphysically primitive acts of existence.

Ṣadrā’s arguments for the fundamentality of existence include an interesting analysis of identity conceived in temporal change. If we consider a certain moment in an individual act of existence, it may be perfectly legitimate to conceive that individual, this horse here, say, as a horse of particular color, height, gait, capacities, and breed – as long as one bears in mind that this involves subsuming it under a certain bundle of universals. But what is more, Ṣadrā claims that I can grasp the horse thereby presently conceived as being identical to the colt I encountered 5 years earlier only by abstracting from some of the features in the two respective acts of existence – a clear sign of cognition by means of universal concepts. This is not to say that the identification of the horse with the colt is unwarranted or dependent on the intellectual operation I perform; the point is that the basis of the identity, that is, the continuity of the creature’s existence, will elude my narrow intellectual grasp.

In the debate of metaphysical fundamentality, Ṣadrā’s theory is often pitted against Suhrawardī who had criticized the Avicennian concept of existence for being a conceptual addition introduced in the human intellect’s consideration of the way in which concrete essences appear to it. It is true that in arguing for the fundamentality of existence,

Ṣadrā spends a great deal of effort on the Suhrawardīan discussion of the “intellectual considerations” (*i’tibārāt ‘aqlīya*), but his more immediate opponent was his erstwhile mentor Mīr Dāmād, who explicitly held the theory of the foundationality of quiddity (*aṣāla al-māhīya*) and whom Ṣadrā himself followed earlier in his career. This he asserts explicitly in his mature works, and the early treatise *Risāla fī sarayān wujūd al-ḥaqq* is witness to his arguing at some length in favor of Mīr Dāmād’s view.

The theory of the foundationality of existence is sometimes argued to entail nominalism. The debate concerning realism and nominalism does not seem to be a major question for Ṣadrā, but there is an element in his concept of existence that makes it difficult to label him as a straightforward nominalist. This is the idea that existence comes in degrees, or entails what has been variously translated as “modulation” or “systematic ambiguity” (*tashkīk*), and that the differences in the degree of existence respective to each thing determine which quiddities are applicable to them. Since he takes quiddities to be based on gradations of existence, Ṣadrā explicitly denies that existence can be conceptualized arbitrarily. Yet the point about metaphysical primacy stands: the gradation of existence is independent of the quiddities that are applied on its basis, but not the other way round. It is in this sense that quiddities are less real than existence, for they first come to be in an intellectual consideration of existence and its gradations.

2. Substantial motion (*ḥaraka jawharīya*) is another idea of Ṣadrā’s invention. According to it, motion takes place not only in the Aristotelian categories of quality, quantity, place, and position but also, and indeed primarily, in the category of substance. He thus stands in polar opposition to the Peripatetic paradigm, according to which stability in the category of substance is a necessary condition for the apprehension of any kind of motion, motion being apprehensible only as the variation in the attributes of an unchanging substantial essence. However, this departure from the

tradition is motivated by an orthodox conviction, for Ṣadrā’s aim in introducing the concept of substantial motion is to make sense of the teleology underlying all natural processes, that is, of the notion that all existents strive by their very nature to exist *well*, each pursuing the perfection proper to it. These teleological processes were traditionally conceived as evolution within the set of the concomitant accidents of substances, with the substances themselves remaining static. Ṣadrā counters this by arguing that lest the teleology be merely fortuitous, it must concern the very essence of the beings under development. In other words, it must be the substance itself that develops and thereby comes to exist more perfectly. Ṣadrā also conceives of this development as a gradual increase in the being’s uniqueness as it acquires new degrees of perfection which, by being founded upon the earlier, encompass them within themselves.

To illustrate the process of substantial development, let us briefly consider Ṣadrā’s favorite example, the human being. We first come to the world as material forms of the embryos in our mothers’ wombs. Once our cognitive organs have reached a sufficient stage of development, we begin to actually perceive, which entails an ascent to a new level of mental existence. Our newly acquired actuality as immaterial mental substances is, however, but an initiation into a considerably more grandiose development within the sphere of mental existence. We first ascend from perception to imagination, which amounts to an increased independence from the material constraints of the sublunary world. Imagination in turn contains the potency for intellection, the final ascent in the substantial motion of human being. In this process, no substantial core of our being will remain immutable through the successive steps from lower to higher levels of existence. The motion concerns the human substance, our very selves, and distinct stages in the process cannot be unqualifiedly identified with each other. As we already saw in our brief discussion of the theory of the foundationality of existence, Ṣadrā thus

subscribes to what we can call a perdurance theory of identity: considered as momentary entities, the infant John and the adult John are two different entities; they are identical only when considered as phases of a single continuity of existence or derivatively by means of a suitable concept. As has been noted by various commentators, this bears a number of similarities to the so-called four-dimensionalist theories of substance proposed in contemporary analytic philosophy.

The theory of substantial motion is thus intimately intertwined with the primacy of existence, and their combination has quite aptly been characterized as a form of process philosophy. But focus on substantial notion does bring out an important feature in the metaphysically primitive notion of continuous existence, that is, its being directed by an internal teleological principle. This principle is the Ṣadrīan equivalent of the Peripatetic concept of substance in the sense that like the concept of substance, it provides the foundation for the identity in change of the individual existent. But unlike the Peripatetic substance, it does not endure unchanged but can only exist as the infinitely rich continuity of motion. As a result, it cannot be abstracted from any particular phase in that continuity, for even if the abstraction were an adequate representation of the phase it is derived from, it cannot adequately represent the whole to which the phase belongs.

Another departure from the Avicennian Peripatetic paradigm is Ṣadrā's subscription to the idea that cognition consists in a unity in the act of existence between the cognizing subject and the cognized object. Although the idea can be read as a reasonable interpretation of Aristotle's theory of cognition in the *De Anima*, it was vehemently criticized by Avicenna, a fact that Ṣadrā was well aware of. In fact, he clearly thinks that his rehabilitation of this venerable doctrine is the sole plausible solution to a number of problems he perceived in Avicenna's cognitive psychology. At the same time, he clearly thought that the theory of cognitive unity is closely connected to the broader themes

of the foundationality of existence and substantial motion, as becomes clear from his reply to Avicenna's refutation of the theory.

According to Avicenna whose cognitive psychology was based on the idea of the cognized forms being impressed in the cognitive organs (in the case of sub-intellectual cognition) or in the soul (in the case of intellection), the theory of cognitive unity violates our intuitions of our stability as cognitive subjects aware of a variety of objects; if I as a subject really were identical with the object I am aware of, then when I shift my regard from perceiving a dog to thinking about my groceries, I actually become a different thing – having been a dog, I am now a bunch of edible substances. Granting that this is a genuine problem for a metaphysics based on the notion of a substance that endures intact through the change of its attributes, Ṣadrā clearly thinks that the problem vanishes when the idea of substantial change is introduced. If any entity subject to change has an identity only in the sense of perduring for a certain period of time, and if the change from me as perceiving the dog to me as thinking about the groceries is understood in a sufficiently nuanced way that enables us to locate a number of common features and causal connections between the two temporal phases, we can save the intuition and do away with Avicenna's refutation. In other words, if the two instances of perceiving the dog and thinking about the groceries are considered as such, then there really are two corresponding subjects. But once the two cognitions are conceived as belonging to a single continuity of mental existence, the subject is one, namely, the continuous mental existence as a whole.

One final topic of importance in which Ṣadrā departs from his predecessors is related to his sustained interest in eschatological questions. In this field, he is witness to an interesting development of the Avicennian and Suhrawardīan theories of an imaginary afterlife as the lot of those human souls that have been insufficiently developed to enjoy the sort of contemplative bliss proper to members of the

human species but have nevertheless developed a set of moral virtues or vices and therefore deserve a certain type of pleasure or pain in the afterlife. Since both Avicenna and Suhrawardī held imagination to be a faculty whose activity is dependent on a corporeal organ, they had to face the question of how we can imagine after the demise of the body and its cognitive organ, the brain. As a solution, they located an *ersatz* organ in the celestial spheres, which the moderately developed souls could allegedly use in imagining their respective deserts. This was an uneasy appendix at best in Avicenna, who had elsewhere conceived of the connection of the soul and its unique body in more intimate terms which the ad hoc solution to eschatology was prone to violate. In the *Ḥikma al-ishrāq*, Suhrawardī makes a number of conceptual moves that mitigate the tension, but the idea of imaginary afterlife nevertheless remained on the level of somewhat undeveloped remarks. Ṣadrā, however, employs the idea as the basis of a full-blown theory of quasi-corporeally felt but fully immaterial reward and punishment in the afterlife. This is possible because, in his psychological theory, he had separated the functioning of the Avicennian internal senses (common sense, formative faculty, imagination, estimation, and memory) from their corporeal organs, treating them dualistically as so many modifications of immaterial mental existence. But although imagination thereby no longer needs the brain as the instrument of its operation, its contents retain their corporeal appearance for Ṣadrā. Hence, we do not need a body to imagine bodies, that is, three-dimensional objects located in space and time. What is more, we do not need the body to experience ourselves as embodied, for even the experience of one's own body can be produced in the incorporeal imagination. Relying on this idea, Ṣadrā attempts to do justice to the full array of the concrete descriptions of the afterlife found in the Qur'ān. This does not mean that he gives up the philosophical idea of pure contemplation as the best lot available to the human elect,

but clearly, he felt the need to address the theological criticism, initiated by al-Ghazālī in the *Tahāfut al-falāsifa*, according to which the philosophers' dualism is incompatible with true Muhammadan revelation.

In broad terms, Ṣadrā subscribes to the traditional conception of philosophy as the perfection of the human soul through the acquisition of theoretical knowledge. This is compatible with the revealed goal of the human species, for knowledge alone can elevate us above material indigency and thereby render us as like to God (*ta'alluh*) as is possible for a created entity. But it is important to notice how broadly Ṣadrā defines knowledge; in particular, it cannot be restricted to a series of syllogistical inferences from first premises but must include intuitive modes and methods as equally valid. Furthermore, Ṣadrā holds that the proper cultivation of our cognitive capacities is dependent on a rigorous process of ascetic and religious discipline, as is evident in his own understanding of the importance of the period of seclusion in Kahak for his philosophical thinking. In his conception of philosophy as a special type of unity of theory and practice, Ṣadrā continues the project sketched out in Suhrawardī's preface to the *Ḥikma al-ishrāq*. This conception also provides the motivation for his eclectic use of sources and the basis for the breadth of his intellectual endeavors.

Impact and Legacy

As a teacher, Mullā Ṣadrā was responsible for the training of a number of the most significant philosophers of the later Ṣafavid period, two of the most important of whom were his sons-in-law, Muḥsin Fayḍ Kāshānī (d. 1680) and 'Abd al-Razzāq Lāhijī (d. 1661/1662), who developed Ṣadrā's philosophy in a more mystical vein. Other notable students included Muḥammad ibn 'Alī Riḍā Aghājānī (d. 1660/1661), the author of a massive commentary on Mīr Dāmād's *al-Qabasāt*, and Shaykh Ḥusayn Tunikābunī

(d. 1690 or 1694), the initiator of a chain of scholars extending as far as the nineteenth century. Their work, together with that of subsequent Iranian philosophers, ensured the transmission of Ṣadrā's philosophical legacy through times adverse to philosophy, until his thought was revived by his Qājār era followers, especially Mullā 'Alī Nūrī (d. 1836) and Mullā Hādī Sabzavārī (d. 1873). Since the nineteenth-century renaissance, Ṣadrā's works have been at the forefront of Islamic philosophical study in Iran, and through the sustained effort of 'Allāma Muḥammad Ḥusayn Ṭabāṭabā'ī (d. 1981) in the face of theological opposition, they have secured a place in the philosophical curriculum of the Shī'ite *madāris* of Qum. This was certainly facilitated by the breadth of Ṣadrā's intellectual outlook which perceived philosophy to be inseparable from the more traditional sciences of theology, exegesis, and jurisprudence, as well as his adherence to ascetic religious discipline as a necessary constituent of the philosophical practice. Indeed, Ṭabāṭabā'ī is still revered for having exemplified this unity of the traditional, the philosophical, and the mystical. Many of the protagonists of the Islamic revolution in Iran, most notably Ayatullah Ruhollah Khomeini (d. 1989) and Morteza Moṭahhari (d. 1979), were also strongly influenced by Ṣadrā's thought.

Müntzer, Thomas

Born: 1488/c. 1489?, Stolberg

Died: May 27, 1525, Mühlhausen

Christopher Martinuzzi

History Department, DePaul University, Chicago, IL, USA

Abstract

Thomas Müntzer was one of the most controversial figures of the dawning years of the Reformation in Germany and an important figurehead in the 1525 German Peasants' War in Thuringia and Saxony (Bloch 1969; Gritsch 2006; La Rocca 1988; Martinuzzi 2016; Matheson 2012; Politi 2011). Theologian; deeply rooted in German Medieval mysticism; humanist scholar; learned in Latin, Greek, and Hebrew; Biblicist; reformer; pastor; prophet; and revolutionary, Müntzer's turbulent life has inspired the work of philosophers, artists, and writers but also political movements and individual thinkers. As a contemporary of Luther, he took part in the great transformation of the Church, started in 1517 in Wittenberg, by seeking his own shade of reform based on the notion of direct revelation of God and the active role played by man in his own salvation, in sharp contrast with Luther's fundamental ideas of *sola Scriptura* and *sola fide*. In the first half of the 1520s, the two reformers competed for the political support of the dukes of the Electorate of Saxony. When it became clear that the authorities would stand aside Luther's Reformation, Müntzer joined the peasant and burger revolts in Thuringia and Saxony. After the 1525 massacre of Frankenhausen, Müntzer was captured, tortured, and then executed alongside other leaders of the so-called peasant revolution.

Biography

Thomas Müntzer was born in the small town of Stolberg in the Harz mountains of central

Germany. The exact birthdate is unknown, but it is generally believed to be around the late 1480s. Dating back from his first appointment as priest in Brunswick in 1514, historians have estimated that he must have been born no later than 1491, since the customary ordination age was 24. Müntzer is supposed to have studied in Leipzig from 1506 and then moved to Frankfurt an der Oder in 1512 for his master's degree in theology (Bubenheimer 1989). Between 1514 and possibly 1521, Müntzer received a stipend from his position as priest, but did not reside often in the small town of Brunswick. From 1515 he also served as provost of a convent near the town of Aschersleben. During these early years, he began to study Johann Tauler and to question Catholic teachings before even meeting Luther and without the recourse to his writings against indulgences (Scott 1989: 9). In the autumn of 1517, Müntzer was in Wittenberg where he attended the lectures of the humanist Johannes Rhagius Aesticampianus and met with Luther, Andreas Bodenstein von Karlstadt, and Philip Melancthon. With these reformers, he would maintain epistolary connections up until 1524. In Wittenberg Müntzer's studies focused on German mysticism, Plato, and possibly Quintilian's *Institutio Oratoria*.

From Wittenberg, he travelled to the village of Orlamünde, where he had been invited by Karlstadt, and from there back to Leipzig to attend the disputation between Luther and Eck in 1519. Between the end of 1519 and the spring of 1520, Müntzer was appointed as confessor of a Cistercian nunnery in Beuditz, where he would find ample time to reflect on the Church fathers and continue to study German mystics, such as Tauler and Heinrich Suso.

In May 1520, thanks to a recommendation by Luther himself, Müntzer received his first assignment as preacher in the Church of St. Mary in the town of Zwickau, close to the bohemian border, where he temporarily took the place of the humanist and reformer Johannes Sylvius Egranus. In the Saxon town, Müntzer encountered the inspirational views of Nikolas Storch, Thomas Drechsel, and his friend Markus Stübner (or Badstübner), later defined by Luther as the "Zwickau Prophets." Though Storch was

only a weaver and a self-taught master of Scripture, the influences between him and Müntzer were manifold and mutual: the two discussed themes such as the criticism of infant baptism and the idea of illumination or direct revelation by God (Kaufmann 2010). In Zwickau, Müntzer achieved a certain following among the cloth workers, miners, and the members of the City Council, despite his forceful polemics with the Franciscans and later on with Egranus himself. When the latter resumed his position at St. Mary's in October 1520, the Council, eager to keep him in town, appointed Müntzer the permanent post of preacher of the Church of St. Catherine. Nonetheless, as a consequence of their theological differences, which climaxed in the printing of defamatory pamphlets and sporadic episodes of intimidatory actions by their respective followers, Müntzer was formally dismissed from his post on April 16, 1521.

After having visited the town of Žatec, Müntzer and his friend Markus Stübner reached the Bohemian capital, Prague, in June 1521. Greeted as a follower of Luther, Müntzer soon preached in many chapels and churches in town. Despite his warm welcoming, Müntzer's mystical approach to faith and his stressing the role of the living Word of God as opposed to the dead letter of Scripture did not find much following among the biblical devotion of the Utraquists and of the Bohemian Brethren. In Prague Müntzer wrote his first complete theological treatise, though never published during his lifetime: the *Protestation Concerning the Situation in Bohemia* (wrongfully known as the *Prague Manifesto*) (Kohnle et al. 2017: 411; Franz et al. 1968: 491; Matheson 1994: 357; Müntzer 2003: 57; Müntzer 2017: 187). It exists in four different versions, two in German, one in Latin, and a Czech translation; and circulated as a manuscript from the late Autumn of 1521. Though sometimes seen as a deeply apocalyptic piece of literature (Goertz 2015; Friesen 1990; Riedl 2014), the *Protestation* focuses much more on anticlerical stances and mystical themes, such as man's tribulation on earth as the only path to true faith, and the moral corruption of the clergy. Because of his ideas, that not only diverged from those of the Church, but

also from Luther's theology, Müntzer was expelled from Prague in December 1521.

Sources about Müntzer become scarce for the period between December 1521 and the spring of 1523. After leaving Prague he was invited to teach in the monastery of St. Peter's in Erfurt. From the Thuringian town, in March 1522 Müntzer sent an important letter to Philip Melanchthon in which he addressed his main concerns regarding Luther's Reformation, especially the notion of direct revelation that the latter so drastically opposed (Bräuer et al. 2010: 127). During these months Müntzer wrote to other important reformers such as Andreas Karlstadt, with whom he shared spiritualist ideas (Bräuer 2010: 150). In the spring of 1522, Müntzer was shortly in his hometown in Stolberg and then in Nordhausen, Sooden, and Weimar, where he met with the reformer and court preacher, Jacob Strauss. In December 1522 he became chaplain in the Cistercian convent of St. George in Glaucha, near the town of Halle, where in secret he preached reformed sermons. For this reason, he was expelled in March 1523, finding refuge in the Thuringian town of Allstedt, where he would settle for more than a year (Martinuzzi 2017).

During his stay in Allstedt, Müntzer wrote most of his liturgical works and religious pamphlets. With the support of the City Council, the electoral intendant, Hans Zeiss, and of the local preacher, Simon Haferitz, he published the first reformed liturgy in the German language and composed the music to go with it. In Allstedt he also published his most controversial works, such as the *Protestation and Proposition* (January 1524) and *On Counterfeit Faith* (July 1524), and the famous interpretation of the second chapter of Daniel, simply known as the *Sermon to the Princes* (August 1524) (Baylor 1993; Betzinger et al. 1990; Franz 1968; Kohnle et al. 2017; Matheson 1994; Müntzer 2017). In spring 1524 Müntzer married a former nun, Otilie von Gersen, who would later give birth to a son. During this time, the reformer tried to seek the support and protection of local authorities and of the Saxon princes but found increasing antagonism from the Catholic lords of the surrounding regions, namely, Ernst von Mansfeld. Despite Luther's ill-feeling

and the complaint of the Catholic lords, the Electors of Saxony granted Müntzer a number of hearings both in Weimar and in Allstedt itself. In the spring of 1524, as a result of the growing religious and social tensions in town, a Marian chapel in Mallerbach was looted and burned down. Though he denied being involved in the matter, Müntzer was accused of having caused the destruction of the chapel through his inflammatory sermons (Bräuer et al. 2010: 507). Moreover, Luther, who saw in Müntzer a threat to his leadership, wrote to the Saxon princes asking them to remove him from his post and called him "the Satan in Allstedt" (Held et al. 2004: 139). As a result, Frederick the Wise and his brother John closed Müntzer's printing press in Allstedt, but did not banish him from their lands as Luther would have wanted. Nonetheless, finding his position compromised, on the night of August 7, 1524, Müntzer left Allstedt (abandoning his wife and son) and made it to the city of Mühlhausen (Müller 2004).

In the Imperial Free City, Müntzer found fertile soil for his preaching and soon published the longest and most radical of his tracts: *A Manifest Exposé of False Faith* (Kohnle et al. 2017: 322; Matheson 1994: 260). In it, his mystical thought found an apex in the Eckhartian notion of the *homo divinus*: through Christ's example of suffering, man (that in his heart had a spark of God) had to become a divine figure on earth. At the end of September 1524, the reformer was involved in a civic rebellion that was led by the local preacher Heinrich Pfeiffer (who would be executed with Müntzer after the Battle of Frankenhausen) (Vogler 2003). When the revolt was placated, Pfeiffer and Müntzer were forced to leave the city.

In October 1524 Müntzer was in Nuremberg where he would meet with his followers Hans Hut and Hans Denck. In the Bavarian town, under the shadow of Willibald Pirkheimer and Albrecht Dürer, the most dangerous and radical works of the Reformation circulated among humanists and merchants alike, creating a fertile soil for Müntzer's predication. In Nuremberg Müntzer had the chance to finish one of his most fiercely anti-Lutheran tract: the *Vindication and Refutation*, printed by Hieronymus Hölzel (Kohnle et al.

2017: 376; Matheson 1994: 327). Reportedly 500 copies of the pamphlet were printed and spread across town and sent to Augsburg. When the City Council discovered the nature of the pamphlet, all the copies found were burned.

Müntzer fled to the south toward the alpine region from where the echoes of the peasants' revolts were growing higher. In the Klettgau region, the peasants had already torched the land since the summer of 1524, and it is not hard to imagine that Müntzer's preaching could have found strong support in the area (Scott et al. 1991). There is little if any documentation on Müntzer's journey through southwest Germany and of his involvement with the local upheavals. In his final confession, however, the reformer admitted under torture that he "had discussed with the peasants of Klettgau and Hegau near Basel whether they wanted to join forces with him at Mühlhausen" and that in the region, "he had issued some articles drawn from the Gospel, on how one should govern, from which, later on, other articles were devised" (Matheson 1994: 434).

In February 1525 Müntzer returned to Mühlhausen having been appointed (through a popular vote) as preacher in the Church of St. Mary. In the weeks that had preceded Müntzer's return, Pfeiffer had managed to take control over the city. In March the citizens were called to elect an "Eternal Council" that would substitute the existing City Council. Müntzer contributed by drafting what are known as the *Eleven Articles of Mühlhausen* (Bräuer et al. 2010: 373; Müntzer 2017: 298). Soon after the whole of Thuringia was up in arms, and Mühlhausen stood as the main stronghold of the peasants and burgers' revolt.

In the months that preceded the famous Battle of Frankenhausen of May 1525, Müntzer's pen became an essential element in transforming the single and separate revolts in the region into a large, widespread, and coherent upheaval that sometimes has gone by the name of "revolution of the common man" (Blickle 1981; Fleischauer 2010; Wolgast 2006). Müntzer's correspondence clearly shows how he played very little, if no part at all, in the military organization of the revolts in Thuringia. Differently from other leaders of the

Peasants' War, he gave the movement an ideological basis on which to stand, a whole new German reformed liturgy to be practiced. His pen and his preaching served him more than the sword with which he is often remembered. On May 11, after having received a desperate letter from the rebels there, Müntzer and several hundred followers made camp in the small town of Frankenhausen. At the same time, an army led by Catholic and Protestant princes alike was moving toward the town. On May 15, 1525, the two armies joined battle. Before the first canon was fired, a halo appeared around the sun: Müntzer and the peasants, supposedly, interpreted it as a sign that God was on their side. When the battle was over, several thousand rebels had been killed, and many more were executed the following days. After a short escape, Müntzer was caught and imprisoned in the castle of Heldrungen. On May 27, after long tortures, confession, and recantation, Müntzer was executed outside the walls of Mühlhausen. His head and limbs were set on spikes and remained there for years as a warning to others who intended to rebel.

Heritage and Rupture with the Tradition

Müntzer's theological ideas strongly diverged from those of Luther, in particular in regard to the notions of *sola fide* and *sola Scriptura*. Through the study of German mystics such as Meister Eckhart, and Johannes Tauler and the *Theologia Deutsch*, Müntzer underlined the importance of man's active role (through a path of tribulation) in finding true faith and undermined the role of Scripture as a source of revelation. Indeed, he believed that God revealed himself directly in man's heart through the Holy Ghost. In his early years, Müntzer studied the Church fathers Tertullian, Cyprian, Eusebius, and Hegesippus but might have also been influenced by the humanist Marsilio Ficino.

Innovative and Original Aspects

In 1523 Müntzer published three tracts (the *German Church Service* book, the *German*

Evangelical Mass, and the *Order and Explanation*) that composed the first German reformed liturgy, which focused on the role of the congregation (that would worship through singing) and the pastor (that would have to preach only in German) and would set an example for all the following liturgical works of the Reformation (Bräuer 1974; Kohnle et al. 2017: 1–266). Müntzer was also the first Saxon reformer to openly write against the sacrament of infant baptism. He did so in his 1524 *Protestation or Proposition* where he stated that baptism represented the mystical union between God and man: a unification that would only come to pass after the believer had followed the path of suffering set before him by God (Stayer 1981). Therefore, the physical rite of aspersion of the waters over the child's forehead, as well as that of full immersion advocated by Luther, lost all meaning in Müntzer's thought. The *Rechte tauffe* could not be given by a minister of God or a priest through a rite but only be achieved through personal suffering and the real experience of faith.

Museum, Renaissance

Elena Vaiani

Independent Scholar, Pisa, Italy

Abstract

The concept museum was rediscovered in the Renaissance. In the ancient world, museums had been used as cultural institutions, not necessarily for hosting collections. From the fifteenth century onward, however, the “place of the Muses” became a space where objects were stored and knowledge was spread through the activity of scholars and visitors, opening the way to the modern idea of the museum.

Heritage and Rupture with the Tradition

The word “museum,” from the Greek *mouseion*, literally means a place devoted to the Muses, the goddesses of the liberal arts. The Museum of Alexandria, for example, was a research center, with a great library where scholars lived and studied. The word was almost unknown in the Middle Ages and was rediscovered in the Renaissance. From the fourteenth century onward, the intellectual movement known as humanism, which spread over Europe between the fourteenth and sixteenth centuries, focused on the study of ancient culture,

which was regarded as model for the present day: men of letters re-entered the realm of the Muses (Findlen 1989). The effort of analyzing classical literature and art led scholars to go beyond the written page and to pay attention to the remains of ancient civilization: ruins and antiquities; and museums began to house both books and objects collected by scholars. Collecting and studying in the Renaissance was also a private activity. A large number of museums (called also by other names, such as gallery, *studiolo*, *Wunderkammer*) appeared all over Europe; these cabinets of curiosities were varied in content and dimensions, and they included both the works of nature (*naturalia*: fossils, animals, stones, etc.) and of men (*artificialia*: antiquities, paintings, instruments, etc.). The strong link between collecting and studying made Renaissance museums more than an accumulation of wonders, as in the Middle Ages: they were places where objects were displayed according to an intellectual project that aimed to show their meaning and relations (Bredekamp 1996; Lugli 2005; Evans 2006).

Innovative and Original Aspects

This idea of museum is best exemplified by the “Museo Gioviano,” built by Paolo Giovio between 1537 and 1543. He chose the word *musaeum* in order to indicate a direct connection to the ancient world, with regard both to the place (believed to be the location of a Roman villa described by Pliny the Younger near Como) and to the function of the building, which housed Giovio's collection of portraits of “famous men,” ancient exemplars of virtue; as an introduction to the visit, the first room was decorated with images of Apollon and the Muses. Giovio published a book with a description of the museum and texts in praise of each famous man portrayed there; his collection was therefore not only accessible to selected visitors but also known through his book (Giovio 1999).

In 1471 Pope Sixtus IV donated some ancient bronzes from the papal treasures to the people of Rome; these sculptures were placed in the Palazzo dei Conservatori on the Capitoline Hill, the seat of the municipal government. The example set by the Capitoline collection, which is the oldest

attempt to start a public museum, was not followed for two centuries. Nevertheless, it was possible to visit many collections: for example, Ulisse Aldrovandi's natural history museum in Bologna was described as full of scholars, of whom Aldrovandi kept a list, and was donated to the Bolognese Senate in 1603. Cabinets of curiosities were not "public" museums, but instead private collections, which played a social and cultural role, increasing the prestige of the owner and contributing to the wellbeing of the community. Objects sometimes moved from private rooms to semi-public galleries: the Grand Duke of Tuscany, Francesco I, commissioned Giorgio Vasari to decorate a private space for meditation, full of treasures, the *studiolo* in the Palazzo Vecchio, built from 1570 to 1572; starting in 1574, however, some of the works were transferred to the Tribuna of the Uffizi, a monumental room near the Galleria, a space open to visitors (Bredekamp 1996; Grinke 2006; Brugnoli 2010).

In Renaissance museums, objects were exhibited according to classification schemes which we know through printed catalogues. The *Inscriptiones vel tituli teatri amplissimi* (1565), by Samuel Von Quicchenberg, is the first treatise about the organization of museums, a practical guide to the "theater" where artworks were on display. Quicchenberg produced a scheme divided into classes and subclasses, enabling a place to be found for any item in a collection. Many collectors published catalogues of their treasures, which both explained and classified objects. Aldrovandi described his collection in the *Teatro della natura*, which became a standard work in natural history for centuries; similar books were produced by Konrad Gessner, Ferrante Imperato, and many others.

Impact and Legacy

The term museum could also be applied to non-physical spaces where knowledge was stored: The "paper museum" of Cassiano dal Pozzo (1588–1657) is a collection of archaeological and natural history drawings classified by typology: like a "real" museum, it was studied by artists and scientists.

It was during the Renaissance that the modern idea of the museum was conceived: an organized space, hosting a collection, meant to be shown to visitors. This concept developed in the eighteenth century with the opening of many public museums, most notably the British Museum and the Vatican Museums (Vercelloni 2007; Simmons 2016).

Musso, Cornelio

Born: 1511, Piacenza

Died: 1574, Rome

Abstract

Cornelio Musso was a Franciscan preacher, bishop, and a conciliar father. He completed his philosophical-theological and humanistic

studies at the University of Padua in 1533. In those same years, he began his commitment as a preacher in Italian, which continued throughout his life from many Italian pulpits, though mainly in Rome, since he was called by Pope Paul III in 1538, who would later appoint him Bishop of Bitonto. Still confident in the reunification of the Church, Musso participated in the Council of Trent and worked to promote an authentic reform of the Roman Church. The central theme of his preaching is the necessity of personal and interior conversion, reachable through the imitation of Christ. This moral change is regarded as an indispensable premise for a reform of the ecclesiastical institution. His preaching relied on a few key elements, such as Humanist culture, Franciscan spirituality, and Augustinian inspiration. These combined intellectual sources had an impact on the characterizing aspects of his praying, in particular on the moral content, the Christocentric religiosity, and on the emotional tension to move the feelings and the will of the believers. Confident in the power of the word, rhetorically elevated, Musso's sermons were inspired by the great models of classical and patristic rhetoric, leaving behind forms of medieval preaching. His sermons paved the way for the modern history of sacred eloquence and inspired Musso's most famous successor, Francesco Panigarola, as well as representatives of the flourishing seventeenth-century literary and religious scenes.

Biography

Cornelio Musso, a native of Piacenza, entered the city monastery of San Francesco of the Frati Minori when he was still almost a child. He was trained under the guidance of Padre Giacomo Rosa da Randazzo, showing precocious and

remarkable skills in preaching. In 1522 he moved to Padua, where he remained until 1534, perfecting his philosophical-theological education at the Convento di Sant'Antonio and at the University of Padua. He gained his doctorate in 1533. He was immediately co-opted into the College of theologians and began teaching philosophy. Between 1527 and 1529 he attended the humanistic environment around Pietro Bembo, studied Greek with Benedetto Lampridio, and devoted himself to the learning of Hebrew and Aramaic, which will continue during his next stay in Bologna. He also came into contact with notorious poets, such as Giovanni Della Casa and Bernardo Tasso, and established a lasting friendship with Bernardino Tomitano and Alvisé (Luigi) Corner, the author of the well-known *Discorso sulla vita sobria* (1558). In the 1530s, he began the exercise of preaching in Padua and Venice. Throughout his existence, he devoted himself to delivering sermons and preaching in numerous Italian cities.

In 1534 he moved to Milan, called by Duke Francesco II Sforza, who appointed him as preacher of the city and as Lecturer of Metaphysics at the University of Pavia. Following the Duke's death and the upheavals in the State of Milan, Musso moved to Bologna in 1537. He became lecturer *Ad lecturam Sacrosanctae Theologiae evangelicae* at the local university and held public lectures of sacred Scripture on Sundays, commenting on the *Epistole to the Romans* of the Apostle Paul. The monumental commentary of Musso on the Pauline letter (*Epistula ad Romanos absolutissima Comentariorum [...] animadversa*) originates from these lectures; it will be published posthumously in 1588 (Musso 1588). Due to the fierce controversies aroused in Bologna on Musso's lectures on the Pauline lectures, probably evoked by a friar of heterodox tendencies, the Franciscan preacher relocated to Rome in 1538. He entered into the service of Cardinal Alessandro Farnese, who named him ordinary preacher in San Lorenzo in Damaso. Next year, he gave his first collection of Lenten sermons (Musso 1586) and began public lectures on the Pauline lectures in the presence of Pope Paolo III Farnese. Of all the sermons given in San

Lorenzo, survive 127 in printed form, including three cycles of Lenten sermons. From 1541 to 1545, Musso undertook the task of apostolic preacher of the Sala di Constantino, delivering more than 300 Latin sermons in front of the Pope and pre-Tridentine Church reformers, such as Gasparo Contarini, Jacopo Sadoletto, Reginald Pole, and Pietro Bembo.

He was elected bishop in 1541. His first see was Bertinoro-Forlì, but later changed, in 1544, for the more prestigious Bitonto, in Southern Italy's region of Apulia. Although willing to take possession of his allocated see, Musso could not reach Bitonto because he was urged by Paul III to head to Trent, where the Council was set up. On 13 December 1545, he gave the inaugural speech (*Oratio R.P.D. Cornelii Episcopi Bitontini [...] in Concilio Tridentino habita*), printed by the end of the year (Musso 1545). He took an active part in the conciliar work as a member of the committee engaged in the subject of the "doctrine of justification"; he also delivered several sermons at the time of the second convocation of the Council in Trent: in these sermons, Musso stated the need to maintain a close relationship between Church and Emperor to destroy the heresies and safeguard the unity of Christian Europe.

At the end of 1549, Musso was able to reach Bitonto. He soon abandoned his see to return to Rome, where he was appointed domestic prelate by the newly elected Pope Julius III. His new task allowed him to resume his activity as a preacher, particularly in the early 1550s. In the spring of 1554, he returned to Bitonto, where he stayed almost 6 years during which he was committed to implementing the conciliar orientations in his diocese notwithstanding poverty, abuses, and tensions with local powers. Following the ascension of Giovanni Angelo Medici to the pontifical throne with the name of Pius IV, Musso was recalled to Rome to serve again as apostolic prelate. In the papal curia, he joined numerous exponents of humanistic culture, many of Padua's formation, and even the nephew of the pontiff, Carlo Borromeo. The sermons delivered in Rome in the early 1560s and in Vienna in the presence of Emperor Ferdinand and King of

Bohemia Massimiliano, along with the exchange of letters with Cardinal Farnese, document Musso's renewed commitment to the implementation of an effective reform of the Church, in the lingering hope of its reunification.

With the end of the Council of Trent, in March 1564, Musso returned to Bitonto where he spent 9 years devoting himself to pastoral ministry, preaching, studying, and stimulating the process of reform. This pace of reform emerges in his works, such as the *Synodus bituntina*, published posthumously (Musso 1579b), and the theological work *Divina historia libri tres*, begun in 1549, during a Padua stay, and remained unfinished (Musso 1587). Musso died in January 1574 in Rome, where he had arrived less than 2 years before to offer his services to the new pope, Gregory XIII.

Three books of sermons, many of which had already been published individually, were printed before his death (Musso 1554, 1562a, 1562b, 1565). His posthumous works include two other books (Musso 1579a, 1582, 1584), and two collections of Lenten sermons, given in San Lorenzo in Damaso between 1539 and 1542 (Musso 1586, 1590).

Heritage and Rupture with the Tradition

Towards the end of the fifteenth century, humanistic culture began to exert a profound influence in the field of sacred oratory and vulgar preaching. The impact of Humanism stimulated a process to go beyond the *sermo modernus*, that is the medieval kind of preaching, in the attempt to provide a synthesis between Christian preaching and classical rhetoric. The *sermo modernus* (also known as *modus scholasticus*) was based on scholastic philosophy and was so named in opposition to the *antiquus modus* of the Church Fathers. This renewed sacred oratory, aimed to reconcile Humanism with Christian religiosity, was inspired by the pattern of the eloquence provided by Greek and Latin Church Fathers and the normative framework offered in the *De doctrina christiana* by St. Augustine. The aim was to shape a modern oratory style, which Erasmus would have theorized in the *Ecclesiastes* (1535), and which post-

conciliar rhetorics would have eventually promoted.

Musso's vernacular preaching contributed decisively to the modern development of that genre and was recognized by his contemporaries as "a new style of sacred eloquence" (Tesaurò 2000, p. 103; see also Borromeo 1632, pp. 23–28). His intention of renovating the genre of preaching is clearly expressed in his letter sent to Bernardino Tomitano and published in 1554 in the first book of *Prediche* (Musso 1554). In this letter, Musso states that he wants to follow the great pattern of eloquence and doctrine offered by the Church Fathers in order to ennoble and dignify the vulgar preaching from a stylistic and linguistic point of view.

Innovative and Original Aspects

The combination between Humanism, Franciscan tradition, and Augustinian inspiration provides the most meaningful indices of novelty in Musso's sermons. On the formal level, they are structured around a single topic, whose development is then divided into two, three, or at most, four sections, and preceded by a foreword. Musso's extended forewords display a clear convergence between preaching and literature, which is one of the most decisive factors in the modern sacred oratory. His writings are characterized by an emphasis on the New and Old Testament of the Holy Scriptures and by a richness of Biblical quotations; yet, they distance themselves from that tendency of contemporary vernacular preaching, which used to offer disorganized centos of biblical verses.

Two additional crucial factors characterize Musso's preaching. Firstly, these sermons clearly express a moral-oriented content. His sermons deal with Christian vices and virtues, material life and the spiritual, perdition and salvation, the happiness of Christian experience, the call for Christ's imitation. These dominant topics outline the moral background, within which doctrinal issues and controversial arguments are also discussed. Among them, the burning topic of the value of works regularly recurs in the sermons

composed around the years of the first convocation of the Council (in 1545) and of Musso's service under the Farnese family. Musso emphasizes on one hand the nature of the faith, conceived as an act of the intellect, which also includes the will, and he stresses, on the other hand, the value of the works as the fulfillment of the faith itself (Poppi 1966b, pp. 240–251). He also considers the relationship between grace and free will as an interaction between the merciful gift of grace, *initium salutis*, and the acceptance of that gift, which is entirely in the free will of man; he similarly conceives the relationship between Sanctifying grace, belonging to God, and perseverance, that is the achievement of human will supported by divine aid (Mouchel 2001, pp. 250–282). Musso discusses these issues, also addressed in the *Comentaria* on the *Lettera ai Romani*, underlining – humanistically – the section reserved for human being and the power of his/her free will in the dynamic of salvation.

The second essential element in Musso's preaching is the emphasis assigned to the function of moving (Lat. *movere*); hence Musso shows a preference for psychological rhetoric, aimed at triggering an emotional before a rational response, and focused on will before intellect. In accordance with the Augustinian and Franciscan conceptions, Musso's sacred oratory firstly relies on the emotional power of the word. Firmly convinced of the seductive strength of the verbose style, he, therefore, adopts an Asiatic style, that is, florid, bombastic, colored with rhetorical devices, and distinguished by the use of prose rhythm. Musso and humanistic Popes Paul III and Pius IV, who had him at their service, recognized this style of preaching as the most suitable to spread the message of the Church. In those troubled times of the Council, the Roman Church had to face the crucial challenge of establishing itself as the guardian of the truth and beauty of the Christian faith (Mouchel 2001, pp. 256–257).

In order to preserve the primacy of the Roman Church and to effectively combat the heresies, Musso addresses the need for reform of the Catholic Church, which, however, could only be realized as a result of genuine conversion.

Therefore, Musso incites with starry vehemence the ecclesiastics and then the believers to undertake a dramatic change of heart and of personal life, pointing to the imitation of Christ as the only way to reach it. The recurring topic of the Cross, which pervades his writings, is the more evidently imbued with Franciscan's principles. This is the main topic of *Terzo libro delle prediche*, dedicated to Carlo Borromeo (Musso 1562b, 1565), which contains some of the sermons given in front of Pope Pio IV and of his nephew Carlo Borromeo, during the Lent of 1562. Musso provides with this book, and the fourth and last one, dedicated to the earthly life of Christ, a portrait of a "fully live painted" Christ (Musso 1565, 5n.n.). He recounts the history of Salvation, from the first Advent to the end of times, through the model of the "perfect man," that is, the historical, therefore imitable, figure of Christ.

This project of "fully live painted Christ," illustrated to Carlo Borromeo in the dedicatory letter of the *Terzo libro*, seals the path started around 20 years ago in Rome in the service of Paolo III, specifically in *Quaresimale* on *Simbolo degli Apostoli* of 1542, defined *Istituzione christiana* (Musso 1590). Through these sermons, Musso intended to gather the believers "at the school of Christ" and lead them to the principles of Christiane doctrine and teach them "the accomplished art of good living". Only the "school of Christ" can pass on this teaching, since it is able to provide human beings with the definitive answers, always and vainly invoked by philosophers: the whole knowledge can find its accomplishment only in Christ, "author of every philosophy." Hence the great cultural program of the *Istituzione christiana* originates: it is an effort "to accord the philosophy of Christ with what ethically good moral philosophers said" (Musso 1590, pp. 1–17). In order to translate it into practice, Musso considers the relationships between faith and reasoning, and between theology and philosophy. According to St. Augustine, Musso states that faith or the authority of Christ comes before; then intellect comes, whose aim is to show the truth of what has been believed. Addressing theology, Musso defines it as the accomplishment of good philosophy, whose aim is the truth and not

the misleading confusion (the latter is an allusion to the Averroist rationalism, well represented at the Padua University, where Musso himself had studied). Musso remarks supreme accordance between good philosophy and theology because the former is the expression of natural reason and the latter of the reason illuminated by faith. This accordance between human and divine knowledge is attested in the whole corpus of Musso's sermons, in which a vast collection of philosophical, literary, and poetic culture is evoked to support the catechesis and becomes a basis for comparison with Christian teaching and the Sacred Scriptures. Musso and coeval learned people still consider the Classical-Christian synthesis as possible and productive.

Impact and Legacy

From the second half of the sixteenth century, Musso's sermons obtained a great publishing success, firstly in Italy, with an impressive number of editions and reprints, then in Europe, until the middle of the seventeenth century. Thanks especially to the French translations of Gabriel Chappuys, from 1584, they were included among the great readings of the Christocentric spirituality that stretched from Luis de Granada to Bérulle (De Rosa 1987, p. 397). The new *modus oratorius* inaugurated by Musso, modeled on classical and patristic eloquence, and aimed at "moving hearts," will be the basis of the Borromaic and sixteenth-seventeenth century rhetorics inspired by St. Augustine's *De doctrina christiana*. These, however, distanced themselves from Musso's oratory on the stylistic level, opting for more austere sobriety and formal simplicity. The Asiatic and ornate style of the Bishop of Bitonto was, instead, inherited by Francesco Panigarola and was appreciated by the main theorists of Baroque poetics, such as Emanuele Tesauro.

Mysticism in the Renaissance

Christopher Martinuzzi

History Department, DePaul University, Chicago, IL, USA

Abstract

Mysticism refers to a religious philosophical approach emphasizing a deep, direct connection between the divine and a believer, achieved by faith and manifested through inspiration and illumination. The word finds its origin in ancient Greek, referring to the term for “to conceal.” Similarly, individuals participating in mystery religions are referred to as *mystae*. Medieval mysticism and inspired forms of Christian faith influenced subsequent religious movements across Europe, such as the Protestant Reformation (especially its radical branch) and the so-called Counter-Reformation. During the Renaissance and the Reformation, mystical thought played a major role in the many attempts to reform the Church. Women, in particular, were instrumental in the diffusion of mystical ideas and practices in both the Middle Ages and in early modernity.

Heritage and Rupture with the Tradition

In late medieval Europe, mystical thought and practice coincided with the threefold notion of the term “mystikos” first introduced by the Church Fathers to indicate the relationship between the allegorical interpretations of Scripture, the liturgical mystery of the Lord’s Supper, and the contemplative character of prayer: a theological system that envisioned an experiential path to the knowledge of God. Renaissance mysticism was influenced by Neoplatonism and the study of figures such as the Pseudo-Dionysius the Areopagite (late fifth to early sixth century), author of the *Corpus Areopagiticum* (McGinn 2006). This work had strong impact on the German theologian and mystical thinker Meister Eckhart (1260–1328), especially in the theological separation between God and the notion of Godhead (the Holy Spirit)

(Eckhart 2009). Through the works of his disciples Henry Suso (1295–1366) and Johannes Tauler (1300–1361) (D’Anna 2006; Morgan 2013; Tauler 1985), Eckhart’s ideas would reach as far as the Reformation and influence such figures as Thomas Müntzer (1489–1525) and Martin Luther (1483–1546): the former centered his entire theology on Tauler’s doctrine of mystical suffering in life as the only path to true faith (an experience-based faith) and illumination (Matheson 1994); the latter, who generally opposed mystical ideas that promoted a direct form of revelation, that undermined scriptural revelation drew many of his early considerations from a fourteenth-century anonymous tract known as *Theologia Germanica* (or *Theologia Deutsch*). This mystical work (Blamires 2003) that Luther himself edited and published in 1516 also gained great prestige among many radical reformers and supporters of the emerging idea of religious tolerance, such as Hans Denck (1498–1527), Hans Hut (1490–1527), Sebastian Franck (1499–1543), and Sebastian Castellio (1515–1563). Indeed, the mystical ideas of the late Middle Ages gave way to a parallel Reformation in the sixteenth century; one that would not argue in favor of *sola Scriptura* (scriptural revelation in the Bible) and for a gratuitous justification based on *sola fide* (faith alone) but for an inspirational and direct form of revelation and illumination, as well as for an experiential faith achieved through the imitation of Christ’s tribulation in life (*imitatio Christi*). These radical reformers believed in a mystical theology of the spirit that contemplated a positive view over man as a perfect creation of God: an idea that radically distanced them from the negative outlook on the sinful successors of Adam presented by most early reformers, sometimes (namely, in the case of Thomas Müntzer) creating a tangible bridge with humanism and the mystical idea of the *homo divinus* theorized by Eckhart (Eckhart 2009; Packull 1977; Roth et al. 2007). In this perspective, man’s soul could reach such a degree of perfection that it could be elevated, in life, to a semidivine status. Nonetheless, even John Calvin, who rejected many forms of medieval mysticism, was inspired by a movement for religious reform known as *Devotio moderna*. This northern European group emphasized piety and pious

practices as the only true method of spiritual growth. Its highest literary expression can be found in the work of the German theologian Thomas à Kempis (1380–1471), *The Imitation of Christ*, one of the most published works of Christian devotion. By stressing the importance of a personal connection to God, this book defined the teachings of “Modern Devotion” and influenced future figures such as Thérèse of Lisieux (1873–1897). The movement, sometimes known as *Brethren of the Common Life*, was practiced by Beguines and Beghards and was strongly opposed by mendicant orders who accused it of going against the 1215 Fourth Lateran Council prohibition to create new religious orders. Moreover, mystical thought and practices were often condemned by the Church and later by reformed churches: Meister Eckhart, for one, was accused of heresy and tried by Pope John XXII; visionary theology and inspirationism would find strong opposition in established and orthodox belief systems. Mysticism did not only influence part of the Reformation but also the so-called Counter-Reformation and other early modern attempts to reform the Catholic Church from within. In Spain, a group known as *Spanish Mystics* attempted to promote a spiritual renewal of the Church (Hamilton 1992). Its most prominent figure was Ignatius of Loyola (1491–1556), founder of the Society of Jesus, who in 1522–1524 composed a set of prayers, practices, and meditations known as *Spiritual Exercises* (Loyola 1991; O’Malley 1993). This work was aimed at helping believers to discern God’s will in their own lives, defining the first steps that would lead to the full fellowship with Christ. The Spanish borne Juan de Valdés (of *Marrano* origins), forced to leave Spain for fear of persecution by the inquisition, would be seen as the spiritual father of many Italian radical and spiritualist thinkers, such as Bernardino Ochino (1487–1564), Pietro Carnesecchi (1508–1567), and Peter Martyr Vermigli (1499–1562), as well as influential noblewomen, such as Vittoria Colonna (1492–1547) and Giulia Gonzaga (1513–1566). In his *Alfabeto Christiano* (1536), Valdés promoted a gradualist and intrinsically mystical idea of faith that he himself had

learned from Spanish *Alumbradismo*, a fifteenth- and sixteenth-century religious movement that was strongly persecuted by the Inquisition (Firpo 2016). The *alumbrados*, as well as Valdés himself, held the belief that external rituals and sacraments were superfluous to reach true faith and the full unity with God. Scripture itself was undermined and only seen as a feeble candle used for initial guidance, because revelation would be received through gradual and direct illumination. Other forms of mysticism that fell within the orthodox boundaries of the Catholic Church in Italy can be seen in the works of Lorenzo Scupoli (1530–1610), a member of the Theatine order, and especially in his tract *The Spiritual Combat*. In England and in the German states, mystical ideas would emerge in both Catholic and Protestant milieus (Davies 1988). In the former case, figures such as John Donne (1573–1631) and Thomas Browne (1605–1682) created a link between Anglicanism, mysticism, and scientific thought (Fanous and Gillespie 2011): this is particularly true for Browne’s works *The Garden of Cyrus* and the *Religio Medici*. In the German-speaking world, mystical ideas later influenced the Pietists movement and figures such as Philipp Spener (1635–1705), known as the “father of Pietism,” and Gottfried Arnold (1666–1714), who developed an original form of Lutheran mysticism in the work *Geheimnis der göttlichen Sophia*. In France, mystical ideas were developed by many religious figures: Francis de Sales (1567–1622), Bishop of Geneva, was the author of many letters of spiritual directions that focused on the notion of pure love that resulted from spiritual practice; Brother Lawrence (1614–1691), a lay brother in a Carmelite monastery, described his personal and intimate relationship with God in the posthumous work, *The Practice of the Presence of God*. These spiritualist attitudes played a part in forming the so-called “Quietist heresy” in France, a Christian movement that sought union with God through mystical prayer and contemplation (that, in turn, would influence the early Quaker movement and its founder, George Fox). Quietist ideas emerged in the work of French mystic Jeanne Guyon (1648–1717), especially in the book *A Short and*

Easy Method of Prayer, for which she would suffer many years of imprisonment (Mallet-Joris 1978).

Innovative and Original Aspects

The role of women in the diffusion and theorization of mystical ideas was particularly important during the late Middle Ages and in early modern Europe. Typically, women mystics spent their life seeking spiritual unity with God through different stages, imitating the suffering of Christ, and envisioning an experience-based faith. They often lived ascetic lives, receiving visions and falling into raptures and ecstasies; in some cases, they actively played a role in public life by acting as councilors for political authorities. In Northern Europe, between the thirteenth and sixteenth centuries, a significant contribution to the development of future belief systems was given by Beguines, such as Mechthild of Magdeburg (1207–1282/1294) and Hadewijch of Antwerp. This lay religious order stressed the importance of the *imitatio Christi* through poverty, religious devotion, and the care of the sick and the poor, often following the teaching of Francis of Assisi. Similarly, Catherine of Siena (1347–1380), an Italian tertiary of the Dominican Order, affirmed to be in personal contact with Christ, experienced miraculous visions, and said to have been united in marriage with Jesus (Catherine of Siena 1980; Emling 2016). Moreover, Catherine exercised influence over significant political figures of the time, such as Pope Gregory XI and Pope Urban VI, and acted as ambassador of the Republic of Florence. Julian of Norwich (1342–1416), an English anchoress, was said to have had experienced numerous revelations including witnessing the Crucifixion and having a dialogue with Christ himself. Teresa of Ávila (1515–1582), a prominent Spanish mystic and reformer in the Carmelite Order, named (as was Catherine of Siena) Doctor of the Church, believed in the ascent of the human soul in four mystical stages: these comprehended contemplative prayer, the surrender to the will of God, the absorption in God, and, finally, the full devotion through ecstasies (Rodriguez et al. 1980; Du Boulay 2004).

Napier, John

Born: 1550, Edinburgh

Died: 1617, Edinburgh

Denis Roegel

University of Lorraine, Nancy, France

Abstract

Scot inventor of logarithms.

Biography

Napier was a member of an old nobility family (Napier 1634) and lived at Merchiston Castle, now owned by Napier University in Edinburgh. Little is known of Napier's formative years. He most likely studied abroad but came back to Scotland in 1571. He must have taken an interest in astronomy and calculations probably in the 1570s. In the 1580s, Napier was involved in the study of the Book of Revelation, and in 1593, he published *A Plaine Discovery of the Whole Revelation of*

St. John where he predicted the Apocalypse (Napier 1593).

From ca. 1594 to 1614, Napier developed the notion of logarithms, for the simplification of trigonometrical calculations (Napier 1614, 1619).

Napier also devised what became known as "Napier rods," simple rods embodying multiplication tables and making it easy to perform larger multiplications. These rods were described in the posthumous *Rabdologiæ seu Numerationis per Virgulas libri duo* (Napier 1617).

Finally, Napier also worked on arithmetic and algebra and devised a general method for the extraction of roots of equations. His manuscript *De arte logistica* was, however, only published in 1839 (Napier 1839).

Heritage and Rupture with the Tradition

Napier lived at a time when more and more astronomical data were accumulated and the computations were still cumbersome. Napier had probably heard from the method of prosthaphæresis for the simplification of trigonometric computations through the astronomer John Craig who had himself learned it from Paul Wittich in Frankfurt at the end of the 1570s. Craig corresponded with Tycho Brahe, and Wittich also influenced Brahe and Jost Bürgi. It is in this context that Napier introduced his new ideas.

Innovative and Original Aspects

Napier had conceived the general principles of logarithms in 1594 or before and he spent the next twenty years developing their theory (Hobson 1914; Horsburgh 1914; Havil 2014; Knott 1915; Rice 2017). The new numbers introduced by Napier were initially called “artificial numbers.” This name is only used in his *Mirifici Logarithmorum Canonis Constructio*, published in 1619, but which had been written long before the *Mirifici Logarithmorum Canonis Descriptio* which made the logarithms known to the world in 1614. In the latter work, Napier coined the word logarithm, from the Greek roots λόγος (ratio) and ἀριθμός (number). Logarithm merely signifies “ratio-number” or “number connected with ratio.” It is possible that Napier found that expression in Archimedes’ *Sand Reckoner*, as it is known that Napier was a good Greek scholar and a number of princeps editions of Archimedes’ book were available in England by the early seventeenth century. In any case, Napier meant to provide an arithmetic measure of a (geometric) ratio, or at least to define a continuous correspondence between two progressions.

Impact and Legacy

Napier’s *Descriptio* was published in Latin in Edinburgh and was considered “one of the very greatest scientific discoveries that the world has seen.” Several mathematicians had anticipated properties of the correspondence between an arithmetic and a geometric progression, but only Napier and Jost Bürgi (1552–1632) constructed tables for the purpose of simplifying the calculations. Bürgi’s work was however only published in incomplete form in 1620, six years after Napier’s *Descriptio*. Napier’s work was quickly translated into English by the mathematician and cartographer Edward Wright (1561–1615) and published posthumously in 1616. A second edition appeared in 1618. The details of Napier’s construction of the logarithms were published posthumously in 1619 in his *Constructio*. Both the *Descriptio* and the *Constructio* have had several editions.

It should be stressed that Napier’s logarithms were not the logarithms known today as Neperian (or natural, or hyperbolic) logarithms, but a related construction made at a time when the integral and differential calculus did not yet exist. Napier’s construction was wholly geometrical and based on the theory of proportions.

Logarithms became ubiquitous in the 1620s, thanks to the work of Henry Briggs (1561–1631), a friend of Wright. Briggs had paid visits to Napier in 1615 and 1616 and he published the first table of decimal logarithms in 1617. These tables of logarithms continued to be used until the advent of calculating machines and computers. But the logarithmic functions also became fundamental functions in mathematical analysis, and as such are more alive than ever.

Abstract

Bruno Nardi was a distinguished and influential scholar on Dante's works and medieval and Renaissance philosophy. Born in Tuscany in 1884, Nardi studied in Belgium (Leuven) and Italy, where he taught in high school and university. In his extensive and often pioneering research, Nardi reevaluated Dante's relationship with his philosophical sources (especially Siger of Brabant and Thomas Aquinas), reassessed the development of Aristotelian tradition(s) between the Middle Ages and the Renaissance, and revealed and carefully analyzed unknown manuscript sources.

Biography

Bruno Nardi was the first-born child in a large Tuscan family. He entered the seminary at Pescia in 1902 and was ordained as a priest in March 1907. The following year he went to the Katholieke Universiteit Leuven (Belgium). He graduated in 1911 with a thesis illustrating the presence of philosopher Siger of Brabant in Dante's *Divine Comedy*. Back in Italy, Nardi faced an acute spiritual crisis and returned to secular life in 1914. Two

years later, he moved to Mantua, where he worked as a high school teacher of history and philosophy. Thanks to Giovanni Gentile, in 1938 Nardi was appointed to teach medieval philosophy at the Sapienza University of Rome. His promotion to Full Professor was once blocked by the Vatican in 1941 and was eventually secured in 1955. In 1964, at the time of his eightieth birthday, Nardi received an honorary doctorate from Oxford University. He died in Rome in 1968.

His intellectual endeavor, chiefly characterized by polemic ardor, focused on Dante's philosophical thought. Even his later works on sixteenth-century philosophy can be considered as further developments of his original research on Dante's works. His encounter with Dante took place at an early age. His thesis *Siger de Brabant dans la 'Divine Comédie' et les sources de la philosophie de Dante* (published in 1912) challenged the prevailing opinion that Dante welcomed Siger of Brabant into the paradise because he was not informed of his thought. The dissertation showed that Dante was not – as generally believed – a strict Thomist and that he admitted the philosopher into heaven precisely because of Siger's thinking. Nardi's second related interest lay in the development of Aristotelian philosophical tradition in medieval and Renaissance Europe (often still in connection with Dante). This task took place in a series of contributions (Nardi 1942, 1945, 1958, 1960), which claim the continuity of some central themes between the medieval and Renaissance philosophy and shed new light on more obscure aspects of this tradition. In the last years, he devoted his attention to Pietro Pomponazzi. In his monograph *Studi su Pietro Pomponazzi* (Nardi 1965), where he collected many of his previous essays on Pomponazzi, Nardi revealed new biographical evidence and concentrated on texts previously overlooked by scholars.

Innovative and Original Aspects

In addition to a profound reassessment of Dante's philosophical position and political thought, Nardi's work dramatically contributed to the rethinking of “the history . . . of thirteenth and fourteenth century

western philosophy” (Dronke 1998, XVI). Against contemporary Neo-Scholasticism, he refused the simplistic identification of Aquinas’s doctrine as the summit of the whole Christian philosophy. This assumption compelled Nardi to carefully investigate heterodox doctrines and reevaluate the individuality of other and less studied Aristotelian currents, such as the Averroism.

Impact and Legacy

Nardi’s method implied a philological study of the original, often unpublished, sources. His investigation was complemented by a careful exploration of the historical and geographical factors of the philosophers and institutions that shaped their positions. His extensive research on Aristotelianism led to a broader understanding of the metaphysical and ontological doctrines, which he traced back to their medieval roots; his legacy played, however, a less dominant role on themes, such as the evolution of logic and the humanistic analysis of texts, that Nardi felt more detached from his interests.

Natural Magic in Renaissance Science

Laura Sumrall

History and Philosophy of Science, University of Sydney, Sydney, Australia

Abstract

Natural magic (*magia naturalis*), understood within the learned traditions of Renaissance Europe, referred to active endeavors that were reliant upon or directed toward forces or mechanisms in nature whose causation or manner of operation were occult (*occultus*) – that is, hidden, or distinctly obscured from an empirical understanding of nature. Natural magic may be distinguished from magic in general by its emphasis on strictly natural objects and operations, crucially distinct from the power of spiritual intelligences identified with demonic magic. Thus natural magic was also characterized variously as the manipulation or application of higher (celestial) influences in the terrestrial world or as the active or applied aspect of natural philosophy, involving the knowledge and manipulation of occult

properties, especially sympathetic correspondences in nature. Understood in this sense, natural magic can be seen to inform many diverse ideas and practices including chemistry, medicine, and mechanics.

Within the multivalent magical tradition that flourished in the Renaissance, natural magic received heightened rhetorical attention in the face of mounting condemnation as a tolerated – if not licit – category of magical theory and practice closely associated with natural philosophy and its academic milieu. Within learned discourse, natural magic became part of epistemological debates through its engagement with the knowledge and manipulation of imperceptible phenomena. This emphasis on occult operations in nature demanded a constant reevaluation of the boundaries of nature and, by extension, the limitations of human influence over nature that would be crucial to the development of scientific thought in the late Renaissance.

Heritage and Rupture with Tradition

Historiographical Notes

Before discussing natural magic, it is necessary to acknowledge that “magic” is a fundamentally problematic category lacking historical cohesiveness or continuity. In addition, the term is plagued by connotations that denigrate associated ideas and practices as irrational or demonic, and its long-standing status as a pejorative largely eclipses any potentially natural taxonomy of magic by grouping together disparate and often conflicting theories and practices according to their identification as heterodox, esoteric, or forbidden. “Magic” in many ways is, as Wouter Hanegraaff has argued, a “tainted term”. For historians, however, no accepted solution has yet to emerge, and the category of natural magic, in particular, remains useful and largely necessary when discussing those theories and practices engaged with imperceptible influences in nature. In this context, one must consider the historical perspectives of both critics and proponents of *magia* as well as the works that by nature of their content place themselves within the same

conceptual territory in spite of avoiding its terminology. It then becomes apparent that in spite of its difficulties, magic includes a significant grouping of theories and practices that must be considered if the intellectual, political, and cultural shifts of the Renaissance are to be understood holistically (Hanegraaff 2012; Walker 1958; Thorndike 1923–1958).

Natural magic specifically was a crucial part of natural philosophy in the Renaissance, in particular for addressing insensible aspects of the physical world. The ideas and practices of natural magic were undeniably participant in the philosophical upheaval of the Early Modern period, contributing to the epistemological reevaluation of the senses and of human reason, from which experimental philosophy would eventually develop. In addition, the breadth of its influence can be found in many interdisciplinary contexts, both theoretical and practical. A more nuanced understanding of natural magic and its role in Renaissance philosophy is emergent in the surge of recent historical studies in magic, and for scholars navigating these and related works, this article seeks to provide a useful if necessarily limited introduction to this important category.

Medieval Origins

Natural magic in the Renaissance must be considered in light of the medieval context that shaped its emergence as a category and defined the circumstances, theological and otherwise, under which it would become a necessary part of the careful rhetorical hedging of magical theory and practice in the face of mounting condemnation. Following the rise of the university and the translation of texts from Arabic in the twelfth and thirteenth centuries, the Latin West faced the considerable task of accounting for not only newly received texts of Classical origin but also a number of Arabic texts – primarily works of astrological magic such as al-Kindi’s *De radiis stellarum* and the *Picatrix* – that introduced magical theories and practices into learned discourse. These newly received works demanded the reevaluation of magic as an intellectual category (Jolly et al. 2001; Kieckhefer 2000; Copenhagen 2015).

William of Auvergne (Bishop of Paris 1228–1249) offered one of the earliest medieval

attempts to comprehensively categorize magical texts in the wake of these inflowing manuscripts. In his *De legibus* (1228–1230) and later in *De universo* (1231–1236), William sought largely to identify characteristics of magical practices that were unambiguously condemned in patristic texts and further opposed during the establishment and spread of Inquisitorial reform beginning in the thirteenth century. Of these categories of forbidden magic, the most clearly condemned was ritual magic, which explicitly invoked spiritual intelligences to be commanded to various ends – the magical practices out of which the “clerical underground” of demonic ritual magic or necromancy would eventually emerge. Also condemned were related practices including all forms of divination (among them “judicial” astrology) and image magic, which purported to manipulate celestial forces – themselves potentially demonic – through powerful words, symbols, or likenesses (Láng 2008; Kieckhefer 1997).

In addition to these multifarious and often overlapping categories of forbidden magic, William introduced the category “natural magic” (*magia naturalis* or *magica naturalis*) to describe the relatively benign manipulation of natural “hidden powers and forces” (*vires et potentiae occultae*) or occult properties. Such properties – which could not be understood in the usual terms of elemental composition – were commonly attributed to the natural influence of celestial motions, manifesting in sympathetic correspondences among plants, minerals, and animals, such as heliotropism or the healing power of medicinal herbs. William often referred to natural magic interchangeably as natural science (*scientia naturalis*), describing this category as a discipline within natural philosophy. Natural magic encompassed the knowledge and manipulation of natural wonders or *mira* and the imperceptible properties responsible for these perceptible phenomena (Láng 2008; William of Auvergne 1674).

In addition to William’s seminal definition, the scope of natural magic can be educed from the contents of three texts widely read in the medieval period: *Speculum astronomiae* (ca. 1260s), an anonymous index of astrological and astronomical texts, both licit and illicit; *Experimenta*

(or *Secreta Alberti*), a book of secrets falsely attributed to Albertus Magnus (ca. 1200–1280); and *Secretum secretorum*, a pseudo-Aristotelian text of Arabic origin that received its first complete translation into Latin within William’s lifetime. These texts cover diverse topics ranging from political advice to herbal medicine, finding a common rhetorical framework in expounding the secrets of nature, be they astrological influences over the human body or sympathetic relationships in nature. This eclectic scope indicates the broad scholastic appeal of natural magic, with potential ends as diverse as they were ambitious. To the larger and more secular communities of formally educated individuals in the late Middle Ages, natural magic offered a highly attractive promise of substantial power over nature through privileged knowledge of its secrets – the occult or hidden properties that natural magic presented for study and exploitation (Láng 2008; Kieckhefer 2000; Page 2013).

The meaning of the term “natural magic,” however, would remain unstable. The occult properties that natural magic claimed to manipulate were commonly understood as arising from the influence of natural, celestial motions or “higher principles” (*altiora principia*) as Thomas Aquinas (ca. 1225–1274) himself asserted in his letter *De operationibus occultis naturae*. Nevertheless, associated astrological practices could implicate spiritual intelligences and therefore demonic magic, and from the perspective of the uninitiated, natural magic could appear to claim command over supernatural influences properly reserved for the divine (Aquinas 1976).

Understandably, many scholars avoided the term “magic” entirely. The Franciscan scholar Roger Bacon (ca. 1214–1292) attributed considerable value to the promises of the *Secretum secretorum* but identified the content of this text and his own work as “experiential science” (*scientia experimentalis*) in explicit opposition to magic, which he associated with illusions and demonic power. His experiential science instead emphasized the primacy of mathematical knowledge, including a geometrical analysis of light that conceptualized its emanation as rays of self-propagating *species* – an imperceptible property

that could account for characteristically occult “action over distance” or remote action, including celestial influences. Bacon emphasized the high status of his secret knowledge and the power it could grant over nature, distancing himself from the magician’s reliance on supernatural powers. Ironically, Bacon would become famed as a magician and potential conjurer among later generations, but his understanding of magic as inherently demonic had a traditional precedent that would be reflected in many hardline demonological texts accompanying the criminalization of magic in the late Middle Ages and Renaissance (Eamon 1983; Láng 2008; Power 2006).

Bacon’s self-conscious aversion to the term “magic” reflects its long-standing status as a term of abuse. Alongside growing academic interest in the promises of natural magic persisted increasingly focused efforts to oppose any potentially demonic form of magic, which in turn propagated apprehension among intellectuals. The uncertain boundaries of natural magic often expanded to include practices commonly considered suspect or contracted to consciously exclude such practices, such that distinctions between, for example, natural magic and image magic – or between natural magic and the mechanical arts – are impossible to consistently establish with an acceptable degree of certainty.

By the end of the fourteenth century, the rise of the Inquisition resulted in a broadening rash of condemnations of magical practices and a tendency to proscribe all forms of magic as suspect of collusion with demons – a stance clearly exhibited by the 1398 *Conclusio* issued by the faculty of theology at the University of Paris, which condemned magic as *superstitio* and *idolatria*. The spread of inquisitorial pressure received added momentum with the Council of Constance (1414–1418), which united Catholic orthodoxy under the Roman papacy and fueled reform efforts that broadly targeted magical theories and practices in their myriad forms. By the fifteenth century, magic came to be seen as a very real and widespread diabolical threat against Christendom, while simultaneously becoming more accessible to an increasingly literate population, both in manuscript and in print. It is,

perhaps, no coincidence that the height of learned magic in the sixteenth century coincided with the apogee of polemical demonology. In the resulting intellectual climate, natural magic would become an important rhetorical category for scholars attempting to establish distance from criminalized magical practices (Hansen 1978; Kieckhefer 1997; Jolly et al. 2001; Peters 1978).

Innovative and Original Aspects

Recent scholarship has revealed the fundamental continuity between Renaissance and medieval magical practices, which share an emphasis on image magic (that purports to manipulate celestial influences by means of symbolic figures) and ritual magic (that focuses explicitly on initiating contact and communication with spiritual intelligences). Nevertheless, the status of the uniquely Renaissance magician or *magus* is one self-consciously distanced from medieval magic. Fifteenth-century natural magic sought legitimacy in part from ancient authority, drawing not only from Greek philosophers such as Plotinus and the imagined Egyptian antiquity of Hermes Trismegistus but also from the ecclesiastical authority of figures such as Thomas Aquinas and Albertus Magnus. This heightened religiosity and *ad fontes* approach to texts elevated magical endeavors with an ancient genealogy reaching back to the *prisca sapientia*, incorporating gnostic elements from Neoplatonism and Jewish Cabala in order to distinguish a newly reformed magical tradition (Klaassen 2013; Ankarloo et al. 2002; Clark 1997; Weill-Parot 2002).

Marsilio Ficino (1433–1499), a scholar and physician in the employ of the Florentine Medici, produced and translated seminal works for this Renaissance transformation of magic. The famed corpus of Hermes Trismegistus, as well as crucial texts by Plato and Neoplatonists such as Plotinus and Iamblichus, were introduced to the Latin West through Ficino’s translations. In addition, Ficino explicated his own theory of magic in his medical treatise *De vita libri tres* (1489), a text that would receive nearly 30 editions by the mid-seventeenth century. In *De vita*, Ficino explicitly contrasted

his own work with illicit magic, identifying natural magic as “subjecting natural materials to natural causes” (*naturales materias opportune causis subiciunt naturalibus*), referring chiefly to the medicinal application of celestial influences over sympathetic correspondences in nature. He identified the natural means of this celestial power as *spiritus*, a subtle medium between body and soul that existed not only in human beings but in fact inundated all of creation, providing an analogical link between the human microcosm and the macrocosm of the world at large, as well as a conduit to divinity, significantly elaborating natural operations beyond the elemental qualities and manifest and occult causes of Scholastic Aristotelian natural philosophy. Although Ficino incorporated a considerable amount of material easily identifiable with the medieval natural magic of astrological medicine and even talismanic image magic (largely derived from al-Kindi’s *De radiis stellarum* and the *Picatrix*), he also borrowed liberally from Neoplatonic philosophy to elevate his magical medicine with the transcendental ambitions and vitalist correspondences of a Neoplatonic worldview (Ficino 1989; Copenhaver 2015).

Ficino’s student Giovanni Pico della Mirandola (1463–1494) diverged from the astrological foundations of his teacher’s work with a more religiously oriented theory of magic that is nevertheless notable in this context for its remarks on natural magic. In his 900 *Conclusiones* of 1486/1487, wherein he proposed an epistemic syncretism derived from magical tradition, Pico briefly describes natural magic as “licit and not prohibited” (*licita et non prohibita*) and furthermore as the “practical part of natural science” (*pars practica scientiae naturalis*), ultimately reflective of the highest, Cabalistic magic fundamental to all knowledge. His sentiments in many ways characterize the early reform of magic in the Renaissance, when the legitimacy of natural magic was established not only by its claim to purely natural causation but also by its derivation from and service to higher religious wisdom (Farmer and Mirandola 1998; Copenhaver 2015; Zambelli 2007).

The work of the learned Renaissance magicians cannot be separated from this struggle over legitimacy, where the magician must determine what strictly distinguished benign forms of magic from a contentious legacy of demonic magic. In his *De vita*, Ficino expressed his sensitivity to the possibility that his own talismanic medicine could potentially operate through demonic power and thus, though natural, be mistakenly identified with clearly illicit demonic magic. In fact, Ficino’s *De vita* appeared shortly after the publication of Heinrich Kramer’s and Jacob Sprenger’s renowned *Malleus maleficarum* in 1486–1487, and the *apologiae* issued by Ficino and Pico in 1487 and 1489 speak to the threat of such anti-magical sentiment as articulated in the *Malleus* (Ficino 1989; Copenhaver 1984).

Nevertheless, within its new Neoplatonic context, natural magic became popular in learned circles at least in part as a framework ancillary or alternative to Scholastic Aristotelian natural philosophy, allowing immaterial mechanisms and occult causation to undergird natural operations. In the sixteenth century, this new natural magic flourishing in Italy would spread north through the works of Benedictine abbot Johannes Trithemius (1483–1505) and, more significantly, the works of his pupil Heinrich Cornelius Agrippa von Nettesheim (1486–1535). Agrippa’s *De occulta philosophia libri tres* (1533) presented a more fully conceived theory of magic that expanded and refined Ficino’s categories. Agrippa was also sensitive to the unsavory connotations of the term “magic,” and in fact he consciously avoided using it in the book’s title, opting instead for the “less dangerous” (*minus infenso*) title *On the occult philosophy*. Nevertheless, he described a much-expanded program of licit magic in which natural magic comprised only one part of a tripartite hierarchy consisting of natural, celestial, and divine magic. Encyclopedic in its sources yet iconoclastic in its regard for them, Agrippa’s philosophy exhibited an incipient fideistic skepticism that ultimately turned to divine knowledge in response to the inadequacy of human reason and experience. Agrippa thus emphasized the necessity of divine insight, but he also distinguished his

natural magic from illicit magical practices by restricting it to natural operations, which he did not seek to contravene or supersede (Lehrich 2003; Nauert 1965; Nettesheim 1992).

Following Agrippa, characteristic features of Renaissance magic include the suffusion of an active world-soul in passive matter, the hierarchical connection reaching between physical matter and divinity, the operative power of the imagination, and the sympathetic correspondences indicative of the relationship between the human microcosm and the external macrocosm that it reflected. In this context, late sixteenth-century texts published on natural magic shifted notably from the emphatically theosophical magical programs espoused by Ficino, Agrippa, and their intellectual contemporaries to ones more focused on investigation into natural operations and the naturalization of occult causes. In this shifting context, naturalizing magic was an important part of both establishing distance from disreputable magical practices and emphasizing the material relevance of the power that magic promised. Thus, while perpetuating these elevated theories of magic, scholars also increasingly emphasized the practical dimension of natural magic.

This emphasis on the practical captured the diverse interests of Neapolitan scholar Giambattista della Porta (1535–1615), who first published his encyclopedic *Magia naturalis* in four books when he was only 15, expanding the work to 20 by its 1589 publication. He insisted that natural magic was nothing less than the “study of nature in its entirety” (*universae Naturae contemplatio*), offering a comprehensive understanding of nature and all its secret operations; it perfected natural philosophy, in strict opposition to demonic magic and the unnatural knowledge upon which it depended, sounding here much like Pico’s philosophy. However, in his considerable work, della Porta devoted only two books to the prestige of higher knowledge, instead dedicating the greater part to recipes, curiosities, and parlor tricks that appealed as courtly spectacle. His emphasis on amusing manipulations of nature seems distant from the lofty ambitions of Agrippa’s high magic, but della Porta’s focus on natural *mira* emphasized the potential to

understand nature more fundamentally through its preternatural states (Eamon 1994; Della Porta 1589).

This ambition to increase human influence over nature through artificial manipulation also recalled the considerable if distorted legacy of Roger Bacon, invoked by no less a personality than the famous magician John Dee (1527–1609), who similarly emphasized the primacy of mathematics in perfecting natural knowledge to grand effect. Similar priorities were echoed in other practices related to natural magic, including the rise of chymical medicine with the iconoclastic works of German physician Paracelsus (1493–1541) and his successors, especially Petrus Severinus (1540/1542–1602) and Jan Baptista van Helmont (1579/1580–1644). Paracelsus posited an ontological theory of disease dependent upon the occult action of invisible *semina* or seeds of disease, forming only a small part of a new chemical philosophy. In the broadest sense, the pervasive influence of natural magic within both Platonic/Neoplatonic and Aristotelian frameworks of natural philosophy encouraged the investigation and naturalization of hidden operations in nature. A contemporary of della Porta, Girolamo Cardano (1501–1576), is an important representative of this approach. An astrologer and physician with highly diversified expertise, he saw the potential to comprehensively expand the purview of human knowledge through unbounded inquiry into the secrets of nature, recommending diverse heuristic approaches both rational and empirical (Eamon 1994; Debus 2001; Eamon 1983; Pagel 1958; Power 2006; Webster 1982).

Impact and Legacy

Magic with ambitious theosophical conceits would continue to attract proponents and detractors into the Early Modern period, notably with the works of the Dominicans Giordano Bruno (1548–1600) and Tommaso Campanella (1568–1639), who would both meet legal woes of varying severity. By the late sixteenth and seventeenth centuries, demonological polemic

against magical practices – such as the Jesuit scholar Martin Delrio's *Disquisitionum magicarum* (1599–1600) – distinguished natural magic as by definition acceptable; however, potential conflation with demonic power ensured its unstable status in natural philosophy. Largely concerned with the knowledge and manipulation of imperceptible forces, natural magic became ancillary to broader epistemological questions concerning the human potential to comprehend what the senses cannot apprehend. In addition, a characteristic optimism concerning the potential of natural magic to empower human enterprise would defy traditional opposition to magical knowledge as heretical curiosity, reflecting an emerging ambition for unbounded human potential. In seeking to submit imperceptible operations to natural causes, the relationship between natural magic and experimental practice would continue to strengthen through the sixteenth century (Delrio 1608; Thomas 1978; Clark 1997).

By the seventeenth century, the rising skepticism accompanying the mechanical philosophy – reflected in the works of men like Pierre Gassendi (1592–1655) and Rene Descartes (1596–1650) – rejected the possibility of immaterial mechanisms in nature along with the hylemorphic metaphysics of the increasingly outmoded Scholastic Aristotelianism. Nevertheless, rejecting the occult through the possibility of rendering manifest these poorly understood mechanisms also recalled the heuristic empiricism of a magical tradition accustomed to seeking knowledge of the insensible. Thus, in the philosophical reform proposed by Francis Bacon (1561–1626) – whose seminal influence the Royal Society of London would claim in their manifesto – natural magic is addressed as severely corrupted yet epistemically promising. In Bacon's appetitive matter theory, sympathetic relationships in nature – distinctly dependent upon a subtle physical *spiritus* – recalled an important role for the magical perspective in his ambition to reveal and manipulate the fundamental operations of nature and to apply this knowledge to the benefit of mankind (Weeks 2007; Rossi 1968; Hutchison 1982).

In the 1960s, it was famously argued by Francis Yates that the Hermetic tradition introduced to the Latin West by Marsilio Ficino and fully realized in the works of Giordano Bruno provided a fundamental intellectual contribution to the development of modern science and technology through its formative influence on experimental philosophy and the mathematization of nature. Subsequent scholarship – including an increased emphasis on Neoplatonic influences – has revealed the inadequacy of assuming this level of cohesiveness in Renaissance magic. Nevertheless, Yates' emphasis on the importance of Hermeticism in the development of Renaissance philosophy was significant in reorienting the historian's perspective to include the undeniable participation of magical thought in the rise of Early Modern science. It is now clear that in fields as diverse as medicine and mechanics, the epistemic and epistemological challenges faced by proponents of natural magic often encouraged aggressively active approaches to natural investigation that complemented the empirical priorities of experimental natural philosophy. Thus, while acknowledging that "magic" is inherently polythetic, we must yet recognize the formative influence of the category of natural magic on the priorities of Early Modern natural philosophers, encouraging active investigation into the boundaries of nature and challenging the limitations of the human capacity to understand and influence natural operations (Yates 1964).

Abstract

Gabriel Naudé was a French physician, librarian, and natural philosopher whose reputation today rests on three pillars. Naudé's early work in systematizing librarianship continues to interest historians of libraries. His relentlessly skeptical scientific and political rationalism and his combined fondness for preserving the state and for the thought of Machiavelli are still cited by historians of thought and politics. Finally, his association with the group of freethinkers led by Pierre Gassendi, a group criticized by René Pintard for what he called their "libertinage érudit" (Pintard 1943), makes of Naudé an important figure in the history of religious dissidence in the early modern era. These three domains are by no means arbitrary: as Damien (2006) and others have emphasized, Naudé's thoughts in all three areas were developing at a time when the intellectual edifice of classical and medieval thought systems – from Aristotle and Pliny to Thomas Aquinas – and of the Christian religion was increasingly being questioned. It was no accident that Naudé, a precocious and brilliant student, should have been attracted to the rational systematization of human knowledge and to the construction of thought systems that could persuasively lay claim to occupying the epistemological space vacated by those classical and medieval predecessors. In a polemical climate in which many French authors, the poet Théophile de Viau being perhaps the best-known example, came under attack from conservative thinkers, it was perhaps inevitable that Naudé himself,

after his death, should become the target of the Capucin polemicist Jacques de Chevanes (Autun 1671).

Biography

Born in Paris (a citation in the parish register quoted by Jack A. Clarke makes 3 February 1600 more probable than the frequently cited previous day (Clarke 1969, 331, n. 1)). In addition to Clarke's very readable summary of Naudé's early life (331–33), René Pintard (1943, 156–173 and *passim*) is still worth consulting. The child of parents of modest means, Naudé was by all accounts a brilliant student who very quickly developed a passion for books and knowledge; while a student at the Collège de Navarre, he came under the influence of the skeptic Claude Belurgey, and skeptical rationalism would remain the core of his intellectual makeup for the rest of his life. Encouraged at first by his family to study theology following completion of his master's degree in 1620, he instead turned to medicine, being more interested, even as a very young man, in natural and human phenomena than in religion and the supernatural. A turning point in Naudé's life came in 1622, when he accepted a position as a librarian to Henri de Mesmes, the owner of an extraordinary collection of some 8000 volumes, which for many years, unlike almost all private libraries, had been open for consultation to the public, and where Naudé came to know many kindred spirits, including the brothers Pierre and Jacques Dupuy, whose circle of scholars would later play a central role in his intellectual life.

Traveling to Italy in 1620, Naudé experienced firsthand the *Bibliotheca Ambrosiana*, which reinforced his enthusiasm for open public libraries. Returning to France the following year, he published his thoughts on the correct constitution and organization of libraries in the influential treatise *Advis pour dresser une bibliothèque* (Naudé 1627), addressed to Henri de Mesmes. Thanks to the good offices of Pierre Dupuy, who was responsible for the library of Jacques August de Thou, President of the Parlement de Paris, Naudé was

able to return to Italy in 1630 and spent the next decade in that country before being summoned back to France in 1642 by Richelieu to take charge of his own library. After Richelieu's death later that same year, Naudé was charged by Mazarin with the task of constructing a library to rival the best in Europe, a mission to which he would essentially devote the remainder of his life. Often purchasing books by the bale without any consideration of whether the authors were luminaries or unknowns and of whether the purchases duplicated works already in the collection, Naudé ransacked not only the many booksellers of Paris but those of all the neighboring countries of France, often purchasing entire collections as they came to market. His success was truly remarkable; as Jack A. Clarke writes, "By the end of December 1647, Naudé had purchased more than 40,000 printed books and 850 volumes of manuscripts at a cost of 65,000 francs—a prodigious sum in those days even for a cardinal" (Clarke 1969, 339). Naudé was also successful in having Mazarin's library opened to scholars so that it could indeed become the jewel that the Cardinal had wished it to be, but the events of the Fronde, and the fall of Mazarin, brought catastrophe: the library was broken up, and dispersed across Europe. In despair, Naudé went into voluntary exile in 1652, taking a position as royal librarian at the court of Queen Christina of Sweden, before returning to France the following year, apparently with the intention of endeavoring to rebuild Mazarin's storied collection. Falling ill en route, however, he died at Abbeville in July 1653; he was interred in the church of St. George, but his tomb vanished when the church was destroyed during the Revolution (Prarond 1871, 312 ff.).

Impact and Legacy

Naudé's reputation today is primarily buttressed by his intellectual activity and his publications in three core areas, the first of which is indeed that of his contribution to early modern librarianship. Naudé's (1627) *Advis* remains a foundational work in this regard, one that Robert Damien has called *un des actes de naissance de la modernité*

["a birth certificate of the modern era"] (Damien 1995, 32). To read the *Advis* today is to be struck by the extent of Naudé's determination, in creating the ideal library, to provide to the curious and learned man unrestricted access to the whole sum of human knowledge: "Tout ce qui est, qui fut, et qui peut estre,/En terre, en mer, au plus caché des Cieux" (Naudé 1627, 23). As Damien has suggested, Naudé is relentless in his insistence on the primacy not of human thought, but of human knowledge ("On pourrait presque dire qu'il n'y a plus pour Naudé de pensée mais des savoirs qui donnent des idées utiles et communicables sur un réel infiniment singulier" [One might almost say that for Naudé it is no longer a question of thought but of knowledge, which provides useful and communicable ideas about an infinitely singular real world]) (Damien 2006, 21). The indiscriminate nature of this drive does much to explain Naudé's insistence on bulk buying: if the ideal library is to encompass the whole of human knowledge, the most obscure authors acquire an importance that in some other schemas they would not have. It also helps to explain Naudé's refusal to include works of fiction in his collecting: like Plato, he believed that writers of fiction provide no understanding of the world as it is.

Naudé devotes an important chapter of his *Advis* (Naudé 1627, 129 ff.) to the question of how the library should be organized: without due attention to the proper principles of taxonomy, he writes, even a collection of 50,000 volumes could no more be called a proper library than a mob of 30,000 men could properly be called an army (Naudé 1627, 130). His insistence on organizational principles is entirely characteristic of his time and recalls, among others, the tireless and minutely detailed work of the Jesuit Claude-François Ménéstrier in iconology and iconography. To read Naudé today is to be made acutely aware of the extent to which taxonomies are reflective of the culture and knowledge: while the principles of order and hierarchy he espouses remain valid, the details of the organization he proposes often strike the modern reader as quaint and antiquated. Naudé concludes his treatise with an appeal to his patron on behalf of the principle of opening libraries to the learned public;

unsurprisingly, he includes a plea to appoint some learned man, steeped in the tradition of books, to take on the task of administering the library (Naudé 1627, 157). This is surely self-serving, but it seems clear that Naudé's real plea is lodged on behalf of the library as a foundational organizing element in the rational construction and preservation of humanity. As Robert Damien has written, "Organiser les savoirs acquis, les cataloguer, les inventorier et les rendre ainsi disponibles et utilisables, c'est conserver une rationalité active qui fut fabriquée et peut être refaite ou parfaite" [To organize the knowledge one has gathered, to catalogue it, to compile an inventory of it and thus make it available and useable, is to preserve an active rationality that has been constructed and that can be reconstructed or perfected] (Damien 2006, 23).

This "active rationality" was to guide Naudé's political and philosophical thought throughout his life, and the *Advis* is in this regard emblematic of his work as a whole. As Anne Kupiec has written, Naudé's work on making books and knowledge accessible takes place in a secular political context which leads him time and again to think about the connections between knowledge and power (Kupiec 1999, 11). In his insistence on opening up the library to the public (not to some vulgar populace, of course, but to the learned lay public), Naudé was acting in a way that many of his conservative contemporaries rightly believed to be subversive. Just as the rigorously ordered structure of the library simultaneously preserves and makes accessible the sum of human knowledge, both keeping it safe and opening it for critical examination, so does the structure of the state play a vital role in providing a bulwark to resist the ever-shifting buffets of fortune. For Naudé, the link between theories of the library and theories of the state thus seems to have been an entirely natural and logical one. His *Bibliographie politique contenant les livres et la méthode nécessaires à étudier la politique* of 1633 (Naudé 1642) and *Considérations politiques sur les coups d'état* of 1639 (Naudé 1639 [1667]) provide clear and abundant evidence of this tendency. For Naudé, the power of the state is to

human politics what the library is to human knowledge, and the two stand in counterpoise: "Face à la souveraineté du pouvoir, au Léviathan, la souveraineté du savoir, la bibliothèque universelle" (Damien 1995; quoted by Kupiec 1999, 16; see also Cavaillé 1998). Like the library, the state is grounded in reason and rationality and thus represents the stability of the wise and learned in contrast to the chaotic and uneducated mob. Like the state, the library thus becomes a thoroughly political entity in the service of human reason.

This insistence on human rationality, coupled with his lengthy and intimate association with a number of early modern French intellectual luminaries deemed by René Pintard to have been "learned libertines" (*libertins érudits*) or free-thinkers, has made Naudé a somewhat controversial figure in the history of ideas. In France, the trial and conviction of the Epicurean satirical poet Théophile de Viau for immorality and blasphemy in the early 1620s had instilled new habits of caution among his freethinking contemporaries and successors. Having as a young man gravitated to the circle of Pierre Gassendi, Naudé soon became closely associated with the freethinkers who gathered under Gassendi's auspices and those of the Dupuy brothers to debate philosophy and theology. One of his first published works, the *Instruction à la France sur la vérité de l'histoire des frères de la Roze-Croix* (Naudé 1623), as Peter Donaldson has emphasized, dwells at length on the need to free oneself from the superstitious habits of the masses and to become what Naudé calls "déniaisé." Donaldson correctly adds that "just how far *déniaissement* is supposed to extend, and whether the attack on superstition is at the same time a guarded assault on Christianity itself, is a debated matter" (Donaldson 1988, 143). Naudé's *Instruction* was published in 1623, the very year in which the incomparably polemical Jesuit François Garasse issued his thunderous demolition of the freethinking *beaux esprits* (Garasse and Salem 2009): coupled with the condemnation of the *Parnasse satyrique* anthology, which had appeared the year before, Garasse's treatise signaled the determination of

the ecclesiastical authorities to eradicate all publications deemed to endanger the moral or political order.

As Jean-Pierre Cavaillé has pointed out (Cavaillé 2011, 2), analysis – both philosophical and psychological – and moral sanction go hand in hand for René Pintard, whose *Libertinage érudit* (1943) was scathing and unequivocal about its subjects. For Pintard, the true scandal of the published work of the “libertins érudits” and the foursome known as the “Tétrade” (Gassendi, Naudé, Elie Diodati, and François de La Mothe le Vayer) was what he viewed as their concerted and systematic effort to mislead the authorities and the naïve. Their discourse was thus largely one in which their irreligious tendencies would be clear to those in the know but sufficiently veiled to escape the dreadful fate that had befallen such heretical freethinkers as Lucilio Vanini and Giordano Bruno. “[Ils] tissent au-dessus de toutes leurs actions une trame transparente aux initiés, mais qui trompera les profanes. Ils s’accoutument à s’entendre à demi-mot, à parler entre eux un langage intelligible à eux seuls. . . .” [Over all their actions, they weave a cloth that is transparent to those in the know, but that will fool the uninitiated. They are accustomed to making themselves understood through hints, to speaking among themselves in a language intelligible to them and them alone] (Pintard 1943, 1:146; cited by Kupiec 1999, 21).

Few scholars have written more in this century on the subject of “libertinage érudit” and on Naudé’s place in that context than Jean-Pierre Cavaillé (see, e.g., Cavaillé 2007, 2009, 2011, 2016). His very substantial critical review (Cavaillé 2011) of Isabelle Moreau’s study of the rhetorical strategies deployed by the *libertins* (Moreau 2007) provides a very useful overview of Naudé’s rhetoric in comparison to that of his contemporaries. Cavaillé, like Moreau and other authors, emphasizes the extent to which Naudé, like La Mothe le Vayer, was adept at using his pen in the service of those in power, taking advantage of their implicit protection to disseminate views that might very well have provoked trouble for him otherwise, though the expressed views of the

Tétrade seem far less inflammatory now than when Pintard published *Le libertinage érudit*. Debate continues about the sincerity of the repeated professions of faith to be found in the works of Naudé and of La Mothe le Vayer, in light of the rationalist and skeptical views they so frequently expressed, but the attention of modern scholars is more frequently drawn to assessing their role in constructing a foundation for their rationalist successors. As many scholars have emphasized, Naudé’s thought is less anti-Christian than anti-superstitious. His influential early satirical treatise, the *Apologie pour tous les grands personnages qui ont été fausement soupçonnés de magie* (Naudé 1625), remains a cornerstone of his legacy in this regard. Written in response to an outbreak of witchcraft phobia in Burgundy during 1644–1645, Chevanes’s violently polemical tract on “learned unbelief” seems, ironically, to have resulted in additional reprints of Naudé’s book, a trend that continued for more than a century after his death and that probably cemented his legacy as a key figure in the development of French rationalism (see Horowitz 2002, 62).

Abstract

Daughter of Charles, Count of Angoulême and Louise of Savoy; sister of the King of France, Francis I; wife of Charles, Duke of Alençon, and after his death, wife of Henry II, King of Navarre; grandmother of Henry of Navarre, future Henry IV, King of France. Marguerite is a key figure of the French Renaissance: a skilled politician, a fervent advocate of spiritual reform of the Catholic Church, a patroness of monastic congregations and literary circles, an eminent mystical poetess, and the first French woman to commit her writings to print.

Biography

Being a princess of royal blood and a peer of France (an honor usually reserved for men), Marguerite was fully engaged in diplomatic relations with the papacy and the main European chancelleries, especially during the crisis caused by the imprisonment of Francis I following his defeat at the Battle of Pavia in 1525. As Queen of Navarre, she also tried to promote the interests of her small kingdom, situated between France and Spain. Receptive to the early writings of Luther, she

helped the young Calvin flee from France, only to be later criticized by him for not admitting her alleged Protestantism. Nonetheless, her fidelity to Catholicism was not merely dictated by political expediency, but was, most of all, consistent with her spirituality and, indeed, her philosophy, which never took the form of a system of thought but rather permeated her poetry, prose, and theater.

Despite her bold decision to allow her poetry to be made available in print, Marguerite de Navarre's literary output was mainly destined for her own aristocratic milieu. Hence, her body of work displays a particular interest in ethical questions she and other courtiers faced (Langer 1999, 2013). Nonetheless, the queen was first and foremost a spiritual writer. The key concept underlying Marguerite's writings is faith, understood not as a professed doctrine, but as trust (*fiance*) in the other. When trust becomes confidence, it may easily turn into a sinful expression of human pride and self-assurance (*cuyder*). Such blindness is exposed in many novellas of Marguerite's *Heptameron*, her unfinished, highly original, and deeply spiritual response to Boccaccio's *Decameron*. To avoid such sinful overconfidence, one has to open the "eye of faith" which is illuminated by intentionality directed at the union with God and His Word. Yet human intentions can never be clearly perceived and understood, especially because they tend to remain hidden under layers of self-justification and disguises, some of which seem at the first sight pious and saintly, while in fact, covering up human nothingness. Only the mantle of God's unmerited grace can truly protect and sanctify the human soul. Such redemption is never assured and can only be hoped for through faith, which is, in fact, hope. Its precondition is the annihilation of our ego in the face of God's transcendent Being. Or rather, in conformity with the tradition of Pseudo-Dionysius the Areopagite and Nicolas of Cusa – whose radical metaphysics was conveyed to Marguerite through her correspondence with the bishop of Meaux, Guillaume Briçonnet – God's Being transcends any being and, indeed, Being itself. As a "suprasubstantial" Being, God is therefore in fact the Non-Being.

However, God's Nothingness is not an ontological status but rather an act: the act of infinite love through which God voluntarily annihilates Himself on the cross. This act of God's entrusting Himself to Man is also an act of faith "working through charity." God's trust calls for a reciprocal act of loving trust on the part of the human being. Indeed, God's annihilation challenges us to look into the abysmal void of our own nothingness, stripped of any hypocritical self-confidence. It is only when we face our own nothingness, only when we annihilate ourselves by aspiring to be united with the Divine Totality, that we will, hopefully, imitate Christ and, possibly, achieve in turn faith "working through charity."

All of Marguerite's thinking stems from such mystic spirituality and metaphysics, which drastically radicalizes the Neoplatonic *doxa* commonly accepted during her times. This especially is the philosophical basis of her writings which, regardless of genre, be it allegorical poetry, chansons, novellas, or theatrical "sotties," is by and large of dialogic nature. This dialogic form of writing is indeed the best enactment of Marguerite's philosophical stance. As a writer, Marguerite never assumes the position of a master lecturing the reader. On the contrary, through specific stylistic and rhetorical devices, she annihilates her auctorial agency in order to entrust the spiritual and ethical transformation of the readers to the mysterious operation of God's grace.

Before the ideological divide between Rome and Geneva became irremediable, Marguerite of Navarre served as the centerpiece of the "Evangelical network" (Reid 2009) of clerics and laymen, intellectuals and poets, philologists and preachers, that attempted to spiritually revitalize the Catholic Church in the 1520s and early 1530s; during this same time, she exerted tremendous, yet subtle, influence on the most illustrious French Christian humanists and writers, such as François Rabelais, Clément Marot, and Jacques Lefèvre d'Étaples. Her 1531 poem, published anonymously, *Miroir de l'âme pécheresse* was translated by the future Queen of England, Elizabeth I. Although the project of spiritual renewal underlying French "Evangelism" ultimately fell victim to the increased theological and political

polarization which led to the Wars of Religion in France, the impact of the movement to which Marguerite contributed, continued in the late Renaissance, in the political thought of Michel de l'Hospital, and in the fideism and skepticism of Michel de Montaigne.

Negative Theology in the Renaissance

Andrea Fiamma

D'Annunzio University of Chieti-Pescara, Chieti, Italy

Abstract

The term “negative theology” refers to any discourse or examination that goes in search of God by negation (via *negationis*). Negative theology is sometimes used by theologians who deny the possibility of human intellect knowing God. This is why negative theology is also called apophatic theology. Negative theology in the Renaissance is present most of all in the fifteenth century, mentioned by authors such as Nicholas of Cusa, Giovanni Pico della Mirandola, Marsilio Ficino, and Lefèvre d'Étaples. From the sixteenth century onward, owing to a doctrine hardening in the aftermath of the Council of Trent, negative theology was less mentioned and only by following the classical interpretation of Thomas Aquinas.

Term

The term “negative theology” refers to any discourse or examination that goes in search of God by negation (via *negationis*). Positive theology defines the names or properties of God. On the contrary, negative theology denies any possibility of predication referred to God because of his transcendence. Thereby, negative theology aims at completing and improving positive theology. Negative theology is sometimes used to underline the impossibility of knowing God. This is why negative theology is also called apophatic theology (Vannier 2011).

Heritage and Rupture with the Tradition

Renaissance philosophy inherits the negative theology model from the Middle Ages as it is put

forward by Dionysius Areopagite in *De divinis nominibus* and *De mystica theologia* (Gersh 1978; Ruh 1990). Medieval commentators were convinced that the author of these works was the same Dionysius who is mentioned in the *Acts of the Apostles* 17, 34. However, the history of negative theology dates back to the interpretation of Plato's *Parmenides* (Steel 2003; Franke 2013). In the Middle Ages, Dionysius's writings inspired academic *Quaestiones* on God's name and provided subjects for scholastic debates. Robert Grosseteste, Albertus Magnus, Thomas Aquinas, Bonaventure, and Meister Eckhart have commented on Dionysius's negative theology based on different keys of interpretation (Wéber 1995; Ruh 1996). In the Renaissance, negative theology is often used to undermine the Aristotelian Scholastic's method and affirm a new Platonic model (Senger 2000). Cardinal Bessarion (1457–1458) in *In calumniatorem Platonis*, Nicholas of Cusa (1449) in the *Apologia docta ignorantia*, and Marsilio Ficino in *De sole* assess the dependence of Dionysius' negative theology on Plato's doctrines (Luscombe 1997). In the fifteenth and sixteenth centuries, Dionysius's method influenced Giovanni Pico della Mirandola, Charles de Bovelles, and others. In the same years, Lorenzo Valla, Erasmus of Rotterdam, Joseph Justus Scaliger, and Isaac Casaubon argue that Dionysius was not a follower of St. Paul, but rather a sixth-century A.D. author (Leinkauf 1997).

Innovative and Original Aspects

In *De docta ignorantia*, Nicholas of Cusa argues that negative theology is to be completed by a positive one in a circular theology. In the dialogue *De non aliud*, Nicholas of Cusa has a character say that God is not in mere negation but rather in negation of negation. The expression *negatio negationis* is borrowed from Meister Eckhart, but it is originally used by Proclus in *Platonic theology*. Lefèvre d'Étaples tries to expel Dionysius from Neoplatonism and interprets negative theology in line with Augustine and Scholasticism (Santinello 1969). Marsilio Ficino, in his commentary on *De divinis nominibus*, states that the principle is beyond all, entity and discourse. The

same neoplatonic doctrine is defended by Pico della Mirandola in the *De ente et uno* (Ficino 1952, 1964–1970; Pico della Mirandola 2010). Both Ficino and Pico privilege the *via negationis* to God (Luscombe 1997). However, Ficino’s originality compared to Nicholas of Cusa, and Pico lies in his revision of Dionysius’ negative theology which results in an irenic philosophy. Ficino integrates Dionysius’ traditional discourse on the divine names with astral symbols from Zoroastrian, Pythagorean, and Hermetic works (Leinkauf 1997; Toussaint 1999; Celenza 1999). Elements of Ficino’s interpretation of Dionysius are also present in the second part of Giordano Bruno’s *De gli eroici furori*.

Impact and Legacy

From the sixteenth century onward, philosophers almost completely cease applying negative theology owing to a doctrine hardening in the aftermath of the Council of Trent (Casarella 2012). However, it is documented that in the sixteenth and seventeenth centuries, several negative theology treaties were commonly used in the monastic milieu, especially among Franciscans, Carmelites, and Cistercians (Leinkauf 1997). John of the Cross uses negative theology as a way to reach God. Unlike Renaissance philosophers, he returns to the Medieval Dionysius’s model, and privileges the mystical union through will. In the seventeenth century, Scholasticism resumes applying negative philosophy following Thomas Aquinas’ commentary on Dionysius’s *De divinis nominibus*.

Neo-Latin Epic

Abstract

While vernacular epic poetry is a comparatively well-studied field, the following entry will focus on Neo-Latin epic poetry from the early modern period. In general, epic poetry was a thriving literary genre throughout the early modern period, understood here as the period from the fourteenth to the eighteenth century, and this was the case not only in terms of quantity: In contemporary poetical treatises, epic maintained supremacy over all other poetic genres. It was used regularly to praise rulers and noble families, cities, or institutions. The main function of these panegyric poems was to legitimize and ennoble their hero and develop a universally valid narrative for them. The authors of these texts often also used them as a means to seek patronage. While at the outset of the Renaissance, epic poems were written in Latin, from the later fifteenth century onwards heroic poetry was also composed in different vernacular languages, and formed the basis for a rich vernacular tradition. The subjects of these poems were historical, mythical, and religious. Formally there exists a wide

variety within the genre ranging from extensive poems consisting of several books to short epics and from supplements to centos. By using the special features of epic (e.g., similes, speeches, catalogs), the poets made themselves part of the epic tradition. This tradition in itself had a considerable impact on the way in which a specific depiction was realized: Many heroic figures are constructed on the model of Aeneas, heroines after Dido and formidable opponents exhibit features of Turnus – just to stress the comparison with Virgil's *Aeneid*. After the eighteenth century, other literary forms took over the function of epic poetry, which became obsolete because of social and political changes.

Introduction

Among the numerous poetic genres we find in the early modern period from the fourteenth to the eighteenth century, epic poetry held a prominent position: The father of Italian humanism, Francesco Petrarca (1304–74), not only composed an extensive Latin epic poem – his *Africa* deals with Rome's fight against Hannibal in the Second Punic War – he even conceded a special place to this work in his complete oeuvre. After all, the *Africa* was the very reason that Petrarch was given the poetic laurel at the Capitol Hill in Rome (Warner 2005, 1–50). By the end of the eighteenth century, a huge number of epic poems had been composed, and offshoots of this tradition can be found as late as the nineteenth and twentieth centuries: The last large-scale Latin epic is the seven-book *In beatam Mariam Virginem a Pio XI pontifice maximo sine labe originis proclamatum* written by the Jesuit Innocentius Polcari (1818–1908) and published in 1905 in Benevent (IJsewijn 1998, 30).

Impact and Legacy

That epic poetry in the early modern period was a widespread and popular genre, is not only evident from the enormous number of texts produced (see

below), but also from a number of metapoetic statements to be found in contemporary writing on literary theory. A few examples will serve to illustrate this assertion: In the 24th book of his *Epistolae familiares* (Petrarch 1999), Petrarch addresses famous authors from classical antiquity. In the title of his letter to Virgil (24.11) Petrarch emphasizes that Virgil as an epic poet was the first of all Roman poets (*Ad P. Vergilium Maronem, heroycum poetam et latinorum principem poetarum*); in the letter, Petrarch writes about the success of the *Aeneid*, still read and appreciated by readers in the early Renaissance (*Ut tuus Eneas vivit totumque per orbem / et placet et canitur*, 24, 11, 55–56). More than a century later, Giovanni Pontano (1429–1503) discusses epic poetry in his dialogue *Actius* (1499) on literary theory. Here one of its interlocutors, Bembo, calls epic “*heroica poesis, quae est omnium regina*” (2,7). In a later example of praise for epic poetry, Marco Girolamo Vida (1485–1566) goes even further: Vida’s didactic poem *De arte poetica* (1527) declares the *Aeneid* the standard for all types of poetry (Rolfes 2001, 146). Again, in 1561, Julius Caesar Scaliger’s (1484–1558) *Poetices libri VII* were published, and he calls epic poetry “*omnium est princeps*” (1.3). Moving on to the next question, a definition of epic poetry, we can refer to a quote from the Jesuit Jacobus Pontanus (1542–1626), who in his poetics (1594) deduces the importance of epic from the deeds of the heroes, who are celebrated in these texts: *illustres illustrium actiones* (famous deeds of famous men).

Definition and Models

It was a difficult task even for the contemporary readership to define what exactly epic poetry was. Whatever features one describes as common and characteristic of this particular genre, some fringe texts always remain which do not fit into the definition proposed. But most commonly, epic poems are long narrative pieces of high style, written in a specific meter typical for the genre (in Latin epic poetry, the dactylic hexameter is the typical verse). Epics are narrative texts dealing with historical, biblical, or mythological events. They are often

modeled on classical prototypes, especially the *Iliad* and *Odyssey* or Virgil’s *Aeneid*, but also on later texts such as Lucan’s *Pharsalia*, Silius Italicus’ *Punica*, or the poems by Statius, i.e., the *Thebaid* and the *Achilleid*. Very frequently, Latin Renaissance epic poems have titles ending in *-eis* or *-ias* and consist of 12 books in imitation of the *Aeneid*. The late antique poet Claudianus served as an important example of how to use Virgil’s *Aeneid* in order to meet panegyric aims and to celebrate contemporary politicians in Virgilian style. Next to classical models, some medieval texts also exercised a certain degree of influence: Walter of Châtillon’s *Alexandreid*, for instance, was a text read at Italian humanist schools, and we, therefore, find traces of creative transformation in Renaissance epic (Haye 2009, 121).

Corpus

The corpus of epic poetry from the Renaissance is enormous (Borinski 1886): Traditionally, Francesco Petrarca stands at the beginning of this period, and his Neo-Latin epic *Africa* ranks as the first epic poem of the Renaissance. The *Africa* remained unfinished and Petrarch wished it to be burned after his death in 1374. But just as with Virgil, who wanted the unfinished *Aeneid* to meet a similar end, Petrarch’s wish was not fulfilled. The *Africa* was published and very widely read. From this starting point, numerous epics were composed, especially in fifteenth-century Italy (Lippincott 1989), in order to celebrate the origins of cities and their ruling families. The *Sfortiad* by Francesco Filelfo (1398–1481) is an example of one such text. Filelfo, who worked at several different Italian universities throughout his career, celebrates Francesco Sforza (1401–66), then duke of Milan in his poem (De Keyser 2015). The *Sfortiad* is a good example of the many contexts relevant for epic poetry in the fifteenth century: the court culture of aspiring rulers, panegyric by poets looking for patronage, *aemulatio* of the most prestigious genre of ancient literature, and so on. In the sixteenth century, the Latin production of epic poetry continued unabated: In 1590, William Alabaster, for example, began his *Elisaeis*, an (unfinished) poem on

Queen Elisabeth I (Binns 1997, 293). But by now a large number of vernacular poems were also being composed which would become models for a huge vernacular production: In France, Pierre de Ronsard (1524–85) portrayed in his *La Franciade* (1572) the legendary founder of the Frankish Empire, Francus. In Italy, Ludovico Ariosto (1474–1533) wrote his *Orlando furioso* (first version 1516) picking up where Matteo Maria Boiardo (1441–94) had left off in his *Orlando innamorato* (1495) and later Torquato Tasso (1544–94) his *La Gerusalemme liberata* (1581), both of which became classics of Italian epic. In Spain and its colonies Alonso de Ercilla (1533–94) wrote an epic poem, *La Araucana* (first version 1569), on the wars during the Spanish colonization of Chile to which the author was an eyewitness. For Portugal, Luís de Camões (1525–80) in his poem *Os Lusíadas* (1572) treated the Portuguese explorations and colonizations in Asia. All these vernacular poems were modeled, like their Latin counterparts, on the original classical models of antiquity. But they were also open to other influences such as the French medieval *chansons de geste*. All in all, the production of epic poetry had reached an impressive rate, both in Latin and the vernaculars. After the eighteenth century, due to the radical changes in society and a new concept of literature, epic was superseded and other literary forms took over its place in the literary scene.

Distribution

In order to get an overview of this vast corpus of epic poetry (Belloni 1912), several approaches have been proposed: Epic poems can be categorized, for example, by topics (e.g., Hofmann 2001). According to this method, the largest group would contain poems dealing with historical topics (Murrin 1994), either by taking a long view of history (e.g., Pantaleon Candidus who describes in his *Gotiberis*, Strasbourg 1587, the empire of the Visigoths in Spain up to the Arabic invasion in the eighth century, cf. Pantaleon 2008), or shorter contemporary events (such as Michael Capellarius who celebrates Queen Christina of Sweden in his *Christinaiis*, printed in

Venice in 1700 – interestingly, one of the few epics with a heroine at its center). Alongside historical poems, epics with religious content were also very popular. We might take as an example Giovan Battista Marino's poem *La strage degli innocenti* (1632) on the Slaughter of the Innocents. Other important topics include mythology, the world of chivalric orders, and the extensive field of didactic poetry which cannot be discussed here, but must also be seen in the context of epic poetry.

An alternative way of categorizing the genre examines the literary form of the poems: There are poems, for example, that compete in length and structure with their classical forebears (e.g., poems in 12 books on the model of Virgil's *Aeneid*). At the other end of the spectrum, there exist innumerable shorter poems, often called *epyllia*, consisting of only a few hundred lines, which nonetheless clearly belong in the epic tradition on account of their style and their use of epic features. There are also special forms like supplements, which attempt to complete some of antiquity's unfinished epic poems (e.g., Lucan's *Pharsalia* or Claudianus' *De raptu Proserpinae*). Ludwig Neumann (1726–77) in his *Supplementum ad librum VI. Aeneidos* (1768) extends Aeneas' glance into the future of his line in the sixth book of the *Aeneid* as far as the Habsburg rulers of his own time (Klecker 2002, 242–47). Centos can be considered another such special form. Here, epic poems are stitched together out of the linguistic material provided by other authors. In 1634, Alexander Ross (1590–1654) published the 13 books of his *Vigilius Evangelizatus sive Historia Domini Nostri Jesu Christi* in London, in which he tells the biblical story from the founding of Jerusalem until Christ's Ascension, using exclusively verses taken from Vergil.

Literary Level

On the literary level, poets attempted to position themselves within the epic tradition. To this end, they used special features of presentation, the so-called type scenes of epic. These literary structures established connections between earlier epic poems, where the same features appeared in

comparable situations, and the new author's own text. One of the most popular examples of such features is the epic simile. By way of a simile, the poet has the opportunity to open a window on a totally different world, to leave the world of politics and war, and to plunge his reader into everyday life, for example, or into particular spaces in his contemporary world. In the third book of Ubertino Carrara's (1642–1716) poem *Columbus* (1715), a comparison is drawn between the busy work of craftsmen and artists and the frenetic activities at the arsenal in Venice (*Columbus* 3.437–47). The liberty that similes permit authors, to integrate ideas from completely different areas of life, was employed by Renaissance poets to embed mythological, biblical, or historical topics: A heavy storm, for example, in the *Xaverius Viator* (1721) of Niccolò Parthenio Giannettasio can be compared to the thunderbolts that Moses heard when he received the Ten Commandments on Mount Sinai (*Xaverius* 6.802–8). Or, in Naldo Naldi's *Volaterrais* (1474) the resolution of a period of turmoil is compared to Neptune who raises his head out of the sea and calls a halt to the winds (*Volaterrais* 3.227–31). Also other types of epic “type scenes” allow direct intertextual allusions to previous poems, including speeches, prayers, scenes where characters are dressed in armor, *aristeias*, shield descriptions, *ekphraseis* in general, games and contests, *concilia deorum*, catalogues, *sphrageis* to name but a handful. When Nicodemus Musnicki in 1805 in his poem *De Christi ab inferis reditu* (2.314–17) describes the shield of the Devil, the passage evokes a number of earlier descriptions and places the new text firmly inside the epic tradition. By and large, the rewriting of scenes taken from classical models was an important technique for epic poets, inviting readers not only to compare the two texts, but ennobling and charging the modern text with intertextual meaning.

Characters

What has been said about epic features in general also holds true for the central characters of Renaissance epic: The heroes who stand at the center of a poem and in whom the origin of important ruling families can be located and later celebrated, invite

comparison with Virgil's Aeneas. In many cases, such a hero will even be depicted like an *alter Aeneas* and his virtues as a ruler will be modeled after the Roman *dux*. Imposing enemies, like Solimano in Tasso's *Gerusalemme liberata* or Caupolicán in Ercilla's *Araucana*, often take on characteristics of Turnus (*Aeneid*) or Hannibal (*Punica*), and the hero's love interest or warrior maidens will be portrayed as Dido or Camilla.

Structure

The structure of Renaissance epics can be explained with reference to a combination of formal and functional aspects: Many poems, dealing with historical events, avoid a chronological arrangement, but rather chose to find their beginnings *medias in res* and to build in earlier elements of the story later on by way of flashbacks among other techniques commonly found, too, in classical poems. On the other hand, many Renaissance epics head for a clear narrative destination (Kallendorf 2007); a final battle, where the hero emerges victorious; a final victory parade where the hero is celebrated; or even an *apotheosis* where the hero is accepted amongst the saints. This teleological aspect of epic poetry, already mentioned at the beginning, is often expressed throughout the poem's overall structure.

Innovative and Original Aspects

Panegyric epic poetry was for centuries the literary form of power *par excellence*. It appeared most frequently in contexts of political or religious power centers and managed to fulfill the particular aims of all the figures involved: Rulers had a clear interest in having themselves and their families celebrated in the highest literary form. In analogy with the Virgilian model, they became a second emperor Augustus whose reign became a model for many aspects of early modern monarchic systems. For the figures around the ruler, an epic poem creates a guiding narrative, a story that builds community and identity, which praises the reign of the hero, legitimizes and ennobles it, and which, in many cases, proclaims the ruler's power along teleological lines according to

the will of God. This normative character of epic poetry is not only visible in the early production of the Italian Quattrocento, where even dubious characters are sometimes lifted up into a noble light, but also, for example, in the time after 1773 when the Jesuit order was suppressed and a number of now ex-Jesuits tried to redeem their prolific and valuable labors by constructing a normative narrative for their order. The poet, finally, anticipated patronage from the ruler or the institution he celebrated in his text. This relationship to power becomes particularly evident when one examines the splendid manuscripts presented to rulers that aimed to make a luxurious display of the importance of their content. In his seminal study *Epic and Empire* from 1993, David Quint could show that Renaissance epic poetry not only presents the voice of power – even if this voice is always louder – but the part of the losers is also portrayed, and thus we appreciate the lot of the underdogs who must suffer under the ruler’s power. This aspect of epic poetry, which allows us to hear the problems of the native peoples in South America in Ercilla’s *Araucana*, for instance, stands in the tradition of Lucan’s *Pharsalia* and safeguards the genre from functioning as mere propaganda.

On a functional level, many epic poems attempt to align themselves with their intended readership by creating a clear opposition between a positive “We,” dominated by the hero, and a dark and negative otherness. This polarization between positive and negative forces, accompanied by the integration of the reader into the positive side, helps the genre to create a sense and identity for its targeted groups. Various levels of the narrative are instrumentalized for this process: Alongside the human story, we often find the sphere of the gods who support the mortal figures: Positive forces, such as God himself (often depicted in the mold of ancient Jupiter), support the hero, while negative forces, like Discordia, the personification of war, back his enemy. This authoritative divine plot allows the poet to expand his perspective into the future: Just as in the first book of Virgil’s *Aeneid*, where Venus addresses her father Jupiter and discovers the future fate of her son Aeneas, whose reign will have no end (*imperium sine fine*, Aen. 1.279), the epic poets of the Renaissance used the same technique to predict a magnificent future for their heroes.

State of the Art

Vernacular epic poetry has been studied by modern scholars – at least in some cases – intensively (Hardie 1993), as helpful overviews and case studies testify (e.g., Borris 2000 for English, Jossa 2002, Sacchi 2006 and Faini 2015 for Italian, Maskell 1973, Usher 2014 for French epic poetry). There exists no comprehensive overview of the Neo-Latin epic poetry of the Renaissance, and critical editions, translations, and commentaries of only a few important texts have been published. The tides, however, are changing and with every case study, our picture of the phenomenon becomes clearer and more subtle.

Abstract

Giovanni Nesi was born in Florence in January 1456 and died in the same town in 1506. He mirrors the troubling sequence of a generation of Florentine intellectuals that saw Plato and Platonism undermine Aristotle and merge with the Hermetic tradition, and that spanned the

ideological and political trim of Lorenzo the Magnificent's age, to later participate in the great reforming hope of the Savonarola's years, to be overwhelmed, again, by the defeat of Savonarola in 1498, and finally to attend at the beginning of the new century to the definitive crisis of Florentine society.

Biography

Giovanni Nesi was born in Florence in January 1456. The wealth of his family allowed him to devote himself to his studies without worries of economic nature and, even if we ignore from whom he got his primary education, we know that he followed very soon Donato Acciaiuoli, of whom he can be considered a disciple. In his youth, he underwent the influence of the Aristotelianism of Acciaiuoli, as well as the one of Cristoforo Landino and the civic tradition of Florentine humanism.

Between 1472 and 1486 he delivered a series of sacred sermons in the secular confraternities that enlivened the religious and cultural life of the city. His first work, still unpublished, dates back to 1484: it is the dialogue in four books, *De moribus*, dedicated to Piero de' Medici, son of Lorenzo. The first three books can be considered a summary of the *Etica nicomachea*, whereas the fourth shows a clear Neoplatonic influence.

Two years later, in March 1486, at the renowned Compagnia dei Magi, particularly linked to the Medici family, he delivered a speech *De charitate*, where platonic and Hermetic themes were displayed with a metaphorical language very close to Ficino's one: but already in *De moribus*, indeed, Nesi had celebrated Ficino as his master.

From 1485 until his death, he held in Florence various political missions, both before and after the event that very deeply marked his personality: his support – although rather eccentric – to Savonarola's movement. Nesi's work that best mirrors this support is the *Oraculum de novo saeculo*, dedicated firstly to Giorgio Benigno Salviati, and then published in May 1497 with a dedication to Gianfrancesco Pico (Nesi 1497; Vasoli 1977). In the *Oraculum* he heralds, with a great abundance of astrological and cabalistic

references, the forthcoming in Florence, the New Jerusalem, of the moral revival predicted by Savonarola – the *Ferrariensis Socrates* – and expected by Giovanni Pico.

The Hermetic and neo-Pythagorean symbols that occur in the work were explained by Nesi in his *Symbolum*, dedicated to the Camaldolese Paolo Orlandini (Celenza 2001). The same versatility, ready to unify the Neoplatonic tradition – that besides Plato's works, was comprehensive also of Hermetic, Orphic and Pythagorean works, and Suggestions by Savonarola – can be found in Nesi's poetic production, that is, in his *Canzoniere* and his unfinished *Poema*, in terza rima (Ponsiglione 2012; Zanini 2014).

In the second half of 1505, Nesi was appointed podestà in Prato. He died in Florence the following year, between November and December, and was buried in the church of Santa Croce (Tortelli 2013).

Heritage and Rupture with the Tradition

Just because of his unbridled versatility, Nesi is an important witness of the cultural and religious ferment and of the unrest of the Florence of his time, that saw Plato and Platonism undermine Aristotle and merge with the Hermetic tradition, before even trying to find a common ground with the *renovatio* preached by Savonarola. In 1484, when he composed the dialogue *De moribus*, he was by the time more than halfway on his intellectual path, and, from his interest in the secular function of the Aristotelian ethics, he had already come to some Neoplatonic stance (Garfagnini 2007). As all the unoriginal personalities, yet capable of reinterpreting in an independent way the ideals and the expectations of his own environment, Nesi mirrors the troubling sequence of a generation of intellectuals who spanned in less than half a century the secular ideals and the ideological and political trim of Lorenzo the Magnificent's age, to later participate in the great reforming hope of Savonarola's years, to be overwhelmed, again, by the defeat of Savonarola in 1498, and finally to attend at the beginning of the new century the definitive crisis of Florentine society (Vasoli 1977).

Abstract

Niccolò Niccoli (Firenze, 1365 – Firenze, February 3, 1437) played an important role as

a merchant and political man in Florence in the early fifteenth century: he assembled a large library that later formed the core of the first public library: that of the Dominicans of St. Mark, built by Cosimo de' Medici on the project of Melozzo da Forlì.

Biography

Niccolò continued with his brothers the work of his father Bartolomeo, who practiced the art of wool. There is no news about his formation: it is presumed that he had been in contact with Luigi Marsili since 1382, when Marsili returned to Florence from Paris, as well as with Coluccio Salutati. He shared with Salutati not only the attendance with Manuele Crisolora, Leonardo Bruni, Iacopo Angeli, and Poggio Bracciolini, but also common interests, such as the project about an edition of the *Africa* by Petrarch, and above all, a passion for books to be read, annotated and transcribed. Drawing on the profits of the merchant's work, he began to collect manuscripts for his library, with tenacity and dedication, as emerges from Bracciolini's *Epistolae* (the first book is entirely devoted to the correspondence with Niccoli: Bracciolini 1984), from Leonardo's Bruni *Epistolae* (Bruni 2007) and also from Ambrogio Traversari's (Favi 2004), where we can find requests for transcription, purchase, and loan of the manuscripts for Niccoli and his friends. The passion for books also pushed Niccoli to arrange in 1408, at his own expense, the library of Boccaccio, which had been deposited in the Convent of Santo Spirito at Florence.

At Bruni's suggestion, and using his economic resources, Niccoli agreed to pay a private wage to Guarino Veronese, who in March 1410 moved to Florence to teach Greek but in 1414 was drawn from the city perhaps because of the clashes with Niccoli. At the same time, driven by an ever-growing admiration for the study of classics and, consequently, by the devaluation of poetry in vernaculars, he contrasted with Cino Rinuccini, who

wrote the *Invectiva contro a cierti caluniatori di Dante e di messer Francesco Petrarca e di messer Boccacci i nomi de quali per onestà si tacciono di questo*. In 1414, Niccoli was named among the officers of the reopened Studium of Florence, confirming the prestige now reached in the city. In 1415, with the dedication of Bruni's *Cicero novus*, he was finally consecrated as the flag of the new culture, politically "invented" and ideologically linked to the imitation of the ancients. In 1417, Cristoforo Buondelmonti also dedicated to him the first editorial of the *Descriptio Insulae Cretae*; also in the same year, at Pisa, where he had fled to avoid the plague, Niccoli purchased from Giovanni Aurispa a Greek manuscript of Thucydides. In the exquisite adventure of the discovery of ancient manuscripts, Poggio Bracciolini was conducting on his many trips to ancient monasteries of Switzerland, Germany, and France at the Council of Constance, Niccoli played a decisive role, probably as a travel lender, but above all a careful and firm reference to the new "discoveries": in fact, as it clearly emerges from the letter of Bracciolini of 16 December 1416 describing to Guarino the discovery of an integral Quintilian in the monastery of St. Gallus, it was Niccoli, next to Bruni, who, verifying the texts transcribed by Bracciolini or the indexes of the manuscripts found, checked and recognized the novelty of the text "uncovered." The exchange with Bracciolini, always woven of news concerning texts and books, continued in the following years, in a relationship of friendship that remained firm until his death.

If Niccoli maintained friendly relations with Bracciolini, he was the protagonist of numerous clashes and controversies: Around 1420, Lorenzo di Marco Benvenuti wrote an *Oratio in Nicolaum Nicolum*, where he challenged Niccoli's private life and urged him to flee from Florence to take refuge in that so-admired Greece of his. But the most traumatic break was that of Bruni, who wrote against Niccoli the *Oratio in nebulonem maleficum*.

The attention to new discoveries of manuscripts never declined in Niccoli: In 1423,

Giovanni Corvini, during an embassy in Florence, brought to Niccoli a codex with the *Orator* and the *Brutus* of Cicero, texts which had recently been founded at the Cathedral of Lodi. Moreover, Niccoli was interested in the transmission of Cicero's *Philippicae*; he had in his hands Tacitus's *Germania*, intervened on the manuscript of Ammian Marcellin smithy discovered in Fulda (current Vat. Lat. 1873), on a Valerio Flacco manuscript, and also on the text of the 12 comedies of Plauto, which were discovered by the young Nicholas of Cusa. In 1431, he wrote a *Commentarium in peregrinatione Germaniae* (Sabbadini 1972, 7–9), that is, a memorandum delivered to the Cardinals Giuliano Cesarini and Niccolò Albergati who departed for the Council of Basel: in this paper, Niccoli listed the manuscripts to search in the monasteries of Germany (Frontino, Tacito, Cicero, and Livio). They were books that had been described by Bracciolini himself. He was also a passionate collector of antiquities, sculptures, and gems, among which the most famous is a chalcedony representing Palladio's abduction; Leonardo Bruni had promised him an ancient stone-carved Narcissus reflecting in the water (Luiso 1980, 30); Ciriaco d'Ancona sent him an “antiquissimum phoenicibus characteribus epigramma”; Traversari sent him from Venice a golden coin representing Berenice (Weiss 1989). As Vespasiano da Bisticci tells, he was in friendship relations with Filippo Brunelleschi, Donatello, Luca Della Robbia, and Lorenzo Ghiberti (Vespasiano da Bisticci 1976, 225–242).

Niccoli had the intention to go to Palestine, according to a Traversari's *epistola* of 1420, as well as to Greece, according to Poggio Bracciolini in February 1421. It was only in 1424 that he arrived in Rome, where he wished to travel from 1406. To welcome him in the months between February and July 1424, there was Bracciolini, enthusiastic about the arrival of his friend to whom he would show the ruins and relics of antiquity. A second trip to Rome in 1426, at the time of Bruni's embassy to Pope Martino V, was unlikely, since it was deduced only from the dialogue of *De*

voluptate by Lorenzo Valla. However, it is also true that in the Catasto of 1427 the name Niccoli did not appear, an element that would benefit his absence from Florence.

In 1430, together with the Medici family and Carlo Marsuppini, Niccoli left Florence because of the plague. Before leaving, on June 11, he had made a will in which he left his library at the Camaldolese monastery of S. Maria degli Angeli, where his good friend Traversari lived. He headed to Verona, where he appreciated the wealth of libraries. Afterward, he made a trip to Venice and then returned to Verona, where, as Traversari tells (Zippel [1891]: 1979, 120), he met Vittorino da Feltre and transcribed some manuscripts. The desire to increase his book collection did not diminish in his last years: In 1433, Alberto da Sarteano wrote to him about some Greek and Latin books in Naples.

He was always attached to the Medici family: on November 4, 1434, he was appointed among the Officers of the Studium.

On January 14, 1437, Niccoli wrote his second testament (also published in Ullman-Stadter 1972, 295–299), which included sixteen testamentary beneficiaries (including Traversari, Bracciolini, Bruni, and Marsuppini), being Cosimo de' Medici the first one, who was entrusted with the task of allocating his library, rich in Greek and Latin codes, “ad communem utilitatem” in the form that would be most suitable. His books constituted the core of the famous library of the Dominican Convent of St. Mark erected by Michelozzo Michelozzi for will of Cosimo himself, remaining in many cases recognizable by the note on the “ex hereditate Nicolai Nicoli.”

Except for two vernacular letters, addressed to Cosimo de' Medici, no letters to his interlocutors, such as Traversari, Poggio, and Bruni, are preserved. It seems that he has written only one work, the *Orthographia*, according to Giuseppe Brivio and the Guarino, which is lost or not traced. From the paleographical point of view, Berthold Louis Ullman and Albinia de la Mare have highlighted Niccoli's decisive role in the recovery of *littera antiquae forme*, with the discovery by de

la Mare, to whom Teresa de Robertis had added some important remarks, of his textual hand.

Nicholas of Cusa

Born: 1401, Kues (Germany)

Died: 1464, Todi (Italy)

Paul Richard Blum

Department of Philosophy, Loyola University
Maryland, Baltimore, MD, USA

Abstract

Nicholas of Cusa was born in Kues (Germany) in 1401 and died in 1464 in Todi (Italy); he studied canon law and pursued a career in the Church, eventually becoming Cardinal. In his philosophical work, he covered philosophical theology, mathematical theory, mysticism, philosophical anthropology, and philosophy of religion. His philosophical theology shifted the perspective from dogmatic approaches to epistemology so that the quest for knowing God was rephrased as the problem of consciously knowing that the transcendent is unknowable. For this, he developed the concept of coincidence of opposites that occurs on the level of the absolute and the minimal. This

insight is exercised in and illustrated by mathematical studies, most prominently the squaring of circles. At this juncture, mathematics meets mysticism, since both address the dependence of the finite on the absolute. Mysticism, however, was for Cusanus always also a pastoral effort communicated to ordinary believers. Mystical experience opens the anthropological idea that aiming for the supernatural is essential to being human and prefigured in the dual nature of Christ. One foundation of Nicholas' thinking is the mutual implication of oneness and diversity (as implied in the idea of coincidence); applying this to the question of diversity of religions he suggests that all of them, including Islam, compete with one another in worship one and the same God so that religious war is a contradiction in terms. Cusanus was received as a model of rational mysticism but also as the first modern philosopher to emphasize the power of the human mind.

Biography

Nicholas of Cusa was born in 1401 in the town of Kues (Latin: Cusa) on the river Moselle in Germany, diocese of Trier. His father was a ship owner and merchant by the name Hennen Kryfftz (= Johann Krebs), meaning crayfish; hence Nicholas later had a crayfish as his heraldic animal. It is advisable to avoid mistaking the place of origin, Cusa, to be the person's last name; appropriate names are Cusanus ("the Cusanian") or Nicholas. Cusanus studied liberal arts in Heidelberg (1416–17) and law in Padua (1417–23); in 1425, he enrolled at the University of Cologne as a specialist in canon law and met the theologian Heymericus de Campo, a Platonizing scholastic who introduced him to the thoughts of Albert the Great and Raymond Llull (Fiamma 2016a).

Working in the interest of the archbishop, who had conflicts with the Pope, Nicholas went in 1432 to the Council of Basel (operating since 1431) and engaged in debates with Hussites and the conflict regarding the supremacy of the council over the pope. This occasioned his first major

work *Catholic Concordance* (*De concordantia catholica*, 1434), in which he laid out the unity in diversity of the Church as both the religious authority and the community of believers. After being ordained a priest and changing his affiliation toward the supporters of the papal primacy, he left the Council in 1437 and, by the order of Pope Eugen IV and Cardinal Giuliano Cesarini, he traveled to Byzantium. The Eastern Church was under the assault of the Ottoman empire and was seeking support from Western Christianity. Therefore, the Council of Basel continued in Ferrara and Florence (1438–39), and the Byzantines negotiated a union of the two Christian Churches (Nicholas, however, was not involved in those negotiations; cf. the entry ► “Byzantine Philosophy, Renaissance”). Cusanus was assigned to receive the delegates in Constantinople and escort them to Ferrara. During the time spent in Constantinople, he studied ancient and medieval Greek philosophy and theology.

According to his own testimony, the journey by ship and the conversations with the Greek scholars inspired him to his major work *On Learned Ignorance* (*De docta ignorantia*, 1440). The fundamental insight was that the human mind has to rise to such simplicity that contradictory ideas coincide. In the 1540s Nicholas wrote sequels to the *Learned Ignorance*, for instance, *On Conjectures*, *The Hidden God*, *Searching for God*, *On Being a Son of God*, *The Gift of the Father of Light* (*De coniecturis*, *De Deo abscondito*, *De quaerendo Deum*, *De filiatione Dei*, *De dato Patris luminum*). He also started research in geometry, which aimed at finding rational solutions to apparently irrational problems, such as the squaring of circles; some of those treatises are *De geometricis transmutationibus*, *De arithmetici complementis*, *De circuli quadratura*, to which he added a “theological complement” (*Complementum theologicum*) (Albertson 2014; Murawski 2019). In 1450 he produced a trilogy of dialogues with a layperson (in Latin, *idiot*): *Idiota de sapientia*, *Idiota de mente*, *Idiota de staticis experimentis*, in which the speculation on human understanding is tested with a person without philosophical sophistication while avoiding terms and tricks of the

theological trade. Due to his advocacy for the community of non-professional believers and his sermons, a legend became popular according to which Cusanus had been educated in Deventer by the Brethren of the Common Life or *Devotio moderna* movement (Bocken 2004, part I; 2012).

During those years Nicholas also lobbied for the authority of Pope Eugen, which earned him the label “Hercules of the Eugenians,” coined by Ennea Silvio Piccolomini, later Pope Pius II. In 1448 he was nominated Cardinal (assigned to the church San Pietro in Vincoli in Rome), and in 1450 he became prince-bishop of Brixen (Italian: Bressanone, in South Tyrol). As administrator of the diocese, he ran into conflict with the worldly power Sigismund, Duke of Austria. He also strove to reform the Christian community and religiosity of the area and continued personally delivering sermons, which was unusual for a bishop at that time. In 1458, after many quarrels with Sigismund of Tyrol, he left his diocese and transferred to Rome entering the service of Pope Pius II (his friend, the humanist Ennea Silvio Piccolomini) where he worked on the management of the curia and the diocese of Rome.

Nicholas’ personal and political expertise was shaken by the conquest of Constantinople by the Turks in 1453. He wrote a book on *Peace of Religion* (*De pace fidei*), a manifesto of toleration. At the same time, he dedicated an almost mystical treatise to a monastery, *De visione Dei*, suggesting that the human vision of God is ensured by His seeing humanity. He continued writing philosophical works that take up the earlier speculations: *De beryllo* (spectacles as a metaphor of speculation), followed by *De aequalitate* and *De principio*. During those years Nicholas wrote three more momentous treatises that display his effort to dismantle common approaches to natural theology and metaphysics: *De posset* contracts the words “can” and “is” to “can-is,” that is, God *is* His power and His creation realizes that while still remaining suspended in the realm of possibility. *De li non aliud* (On the non-other) unfolds the otherness of God: God is distinct from creation and hence “the other”, but that is God’s identity that can humanly be known and insofar He is not unattainable; God is positive as being a double

negation: God is “non-other” than the other. *De venatione sapientia* pursues wisdom as a goal that keeps being hunted so that wisdom achieves the insight that the hunt never will be completed. Once again, Cusanus employs mathematical speculation in order to persuade the reader that the human understanding knows what precision might mean without ever reaching perfection – this is the theme of *De ludo globi*, in which an asymmetric ball that only haphazardly hits the mark represents the approximating effort of the mind.

Once more Nicholas addressed the question of diverging religions when he “scrutinized the Qur’an” (*Cribratio Alcorani*) in a detailed commentary that both criticizes Islam and offers paths toward community. During the last year of his life, he produced two summaries of his thinking, aptly titled *Compendium* and *De apice theoriae* (*The peak of speculation*).

In 1458, Cusanus founded, together with his family, a hospital in his hometown Kues, an infirmary for thirty-three elderly single men of all strata, which is still in operation. The design of the building followed mathematical rules (for instance, the cloister has $1 + 2 + 3 + 4$ windows). It also accommodates the library of manuscripts that he collected over his lifetime. His last travel was intended to meet Pope Pius II in Ancona and embark on a new crusade. He died while in Todi (Umbria) in 1464 and was buried in the church San Pietro in Vincoli in Rome, but his heart was transferred to the hospital in Kues.

Heritage and Tradition

As a philosopher and theologian, Nicholas of Cusa was well versed in the late scholastic methods and patterns. He strives to undo the technical school terminology and, with it, the patterns of argumentation that can be largely related to Aristotelian logic and ontology; and he does so by starting with *Learned Ignorance* (Vimercati and Zaffino 2020). For instance, he opens this work with the statement that in the same way that hunger indicates natural self-preservation, the intellect works to perfect itself, since intelligence and being are the same (Dedication to

Giuliano Cesarini). To a reader trained in scholasticism, this must have been a provocation because it parallels bodily desire with speculation and, while defining the mind as a substance, undoes such ontology by emphasizing the dynamic process of thought.

Another intellectual climate that influenced Cusanus was Renaissance humanism (Secchi 2018). This is evident in the literary forms he adapted, especially fictional dialogues. He also uses personal letters to discuss matters of universal importance, and frequently he opens a work with a personal reminiscence (e.g., *De pace fidei*, *De visione Dei*). Moreover, he shows historical awareness both respecting the changes of mindsets over time and the importance of historical documentation. In his *Catholic Concordance* (bk. 3, ch. 2), he proved with close reference to historical sources that the so-called Donation of Constantine, that is, the transfer of worldly power from Emperor Constantine to the Roman Pontiff, is not supported by any documentation. In this, he paralleled Lorenzo Valla, who also debunked the main document as a forgery, among others, on philological grounds. Cusanus later expressly recommended Valla’s philological expertise (Casarella 1992, 437–39). Cusanus opens this work by admitting to being aware of a humanist style but unable to comply for reasons of accuracy, which was a frequent dilemma in the humanist debates about eloquence and elegance. At the same time, he insists that any interpretation, legal or theological, has to be based on an accurate reading of original sources. Nicholas’s admiration for the ancients was encouraged by his encounters with Greek scholars: he maintained scholarly contact with Cardinal Basilios Bessarion, and throughout his life he collected manuscripts. Platonic and Neo-Platonic sources caught his attention as they became mainstream in Renaissance philosophy.

Among the late medieval influences, Raymond Llull’s work was outstanding. Reading and commenting on manuscripts provided Cusanus with the analogical method, present in most of his work, according to which there is a correlation between the creative activity of God and the properties of creation, which make understanding the world and, by inscrutable analogy, any

speculation of the divine logically possible (Blum 2018, 91–105). He also knew mystical, Platonizing, and natural philosophical trends in medieval philosophy, for instance, Albert the Great and Thierry of Chartres (Albertson 2014; Fiamma 2016b), while Paolo dal Pozzo Toscanelli, whom he befriended in Padua, might have introduced him to mathematical methods.

Philosophy

Philosophical Theology

Nicholas of Cusa achieved an important advancement in philosophical theology. Inspired by Raymond Llull who had designed his new method with the aim of finding rational arguments that might convert Muslims to Christianity, Nicholas addressed the question of the very relationship between human reason and divine wisdom. Instead of over-relying on the power of the intellect, he laid bare the weaknesses and limitations of the human mind. Every investigation, he said, aims at the unknown; hence, ignorance is the driving force of understanding. God is the greatest possible unknown and coming to understand God means maximal ignorance. Consequently, Cusanus speculates about the meaning of maximum and minimum as those extremes that exceed reason. In being beyond limits they coincide. This is how the treatise on *Learned Ignorance* unfolds. In book 1, he explains why the Trinity as oneness is incomprehensible and applies mathematics as a paradigm for reasoning in terms of approximation and proportion. He transfers this method to metaphysics because, in patterns of Platonism, every being is what it is by way of proportionate participation in the absolute. Book 2 then argues that everything can be seen as a proportionate manifestation of the absolute to the extent that the universe is an image and a vestige of the Trinity; and as such it is also a sign that refers back to the Creator. This also applies to the finite world, which is indefinite insofar as God is its center and circumference. In this context, Cusanus anticipates the reasoning of Nicholas Copernicus assuming that the earth is not at the center of the planetary

system but a planet among others (II 12). After having argued for the presence of the absolute in the proportional finite, book 3 lays out a philosophical anthropology, according to which the coincidence of the absolute and the concrete (“contracted” in Cusanus’ terminology) is realizable only in human existence (Webb 2020). Paradigmatic is the case of Jesus who, in Christian creed, is both human and God, that is, a concrete being and the absolute. With reference to scholastic discussions about the question, in which sense the statement “In Christ, God is man” is true, Nicholas defines Jesus as the instance, in which God is in equal unity with maximal humanity (III 4). In his concluding letter to Giuliano Cesarini, the method is summarized as: “in learned ignorance we gather the incomprehensible in incomprehensible ways,” so that the quest itself remains the essence of human endeavor. The novelty of this philosophical theology is documented by the critique of a contemporary theologian, Johannes Wenck, who identified the work as anti-Aristotelian, mystic, and making Creator and creation coincide, in modern terms: pantheistic. Nicholas responded to the pamphlet titled *On ignorance of literature* with an *Apology of Learned Ignorance* (Wenck de Herrenberg 1910; Nicholas of Cusa 1988; Ziebart 2014, 53–163). The philosophical difficulty of Cusanus’ method is his persistent changing between epistemological and metaphysical approaches; no statement is plainly factual nor merely methodological; the perspective deliberately conjoins that of the absolute divine and that of the human experience and strife. Therefore, at the same time as working on *Learned Ignorance* he also wrote a treatise with the telling title *On Conjectures* (*De coniecturis*). Conjectures may be surmises, guesses, inferences from given knowledge, or even dreams, that have in common the purpose to gather as far as possible something unknown. The unity of the truth that per se is unattainable can be known, but only by presuming that it is other than anything known, which otherness is what can humanly be known. Conjectures are one of the human creative potentials that reflect God’s fecundity (*De coniecturis* 2 and 3). Nicholas illustrates that with examples from mathematics.

Mathematics

Unity and otherness, for instance, may not be taken to be utterly opposed; rather, reality is a seamless floating between these extremes. Since neither of these extremes has tangible reality, Cusanus depicts them with a geometrical figure of two pyramids, like a simile or paradigm, in which one pyramid has Unity as its base, the other has Otherness as its base (*De coniecturis* I 11, figura P); these two intersect and penetrate each other in such a way that the peak of each pyramid touches the base of the other. In this image, the least degree of unity coincides with utmost otherness, while the least degree of otherness transcends into unity. Spread out between these two, utter oneness and utter difference, is the reality of the world and heavens. Mathematics, namely geometry, has some advantages in philosophical argumentation. First, it is not entangled with material reality which, by definition, is changeable and uncertain; then, it may refer to absolutes like Zero and All without any expectation of handy availability, as can be seen in the extremes of unity and otherness. The third, and eventually most important feature of geometry, is its reliance on the mind: eventually, it turns out that mathematics is paradigmatic for the creativity of the mind that construes its ideas (Floss 2020; Murawski 2019; Albertson 2014; Counet 2004). In his dialogue *Idiota de mente* (II), he mentions a person who crafts a wooden spoon by transferring the shape of the ideal spoon into a piece of wood as a proportionate image of the ideal. This is possible, he explains, because the mind creates proportions and differences in things. It is the mind that produces point, line, plane, and body, as well as number, multitude, and magnitude. Mind is defined as that which measures (*mens – mensura*) (*Idiota de mente* IX and I–II). Given that the source of understanding things lies in the mind as such, and given that mathematics is a pure intellectual activity that builds the foundation of lofty speculation, performing mathematical operations reveals first and foremost the very nature of the human mind. The “objects” of speculation are within the thinking subject: whatever the mind sees, it sees it in itself (*Complementum theologicum* II).

In his *Compendium*, Cusanus turns this insight into the nature of measuring and calculating into a theory of signification. He likens the philosopher to a geographer designing a map of the whole world. Locked in his study he sends out his scouts, the five senses, who report to him the sensible world. Then he dismisses them, shuts all gates, and draws a map in the right proportion. Now he reflects upon his agency as a geographer: as the map is the product of his experience, which is reproduced proportionately in order to signify the external world, so God creates the world in order to signify proportionately his power of creation. This is just one example of how Nicholas alternates between human reasoning and mind-transcending theology.

Mysticism

Cusanus is mostly concerned about the relation between humans, God, and the world in such a way that positive statements are not the immediate goal but, rather and akin to negative theology, reflections on the impossibility and desirability of certitude. In this sense, his philosophy and theology resonate with mysticism. In his *De visione Dei* Nicholas offers a philosophical explanation of the difference between rational theology and trans-rational vision. The text is a response to criticism of his philosophy – including political implications – in the form of a letter to the brethren of the monastery in Tegernsee in Bavaria (Ziebart 2014, 137–96). Its most prominent feature is the description of an icon of the all-seeing God. Every single viewer of the image feels like being watched while looking at it from any angle. From this, Cusanus develops a theory of mystical contemplation that aims beyond the sensual and intellectual, and yet can be deliberately initiated by the faithful who is intent on leaving rationality behind. This transition is metaphorically described (*De visione* IX) as finding God behind the “wall of paradise” where opposites coincide, and which is guarded by the “highest spirit of reason” that must be overwhelmed in order to gain access. Remarkably, the human condition remains the valid point of departure: considering concrete humanity leads to absolute humanity,

which is God who is the ultimate paradigm of all humans or humans in absolute essence.

Anthropology

Nicholas of Cusa shared with the humanists and the mystics a keen interest in the meaning of being human. Not only was the human condition of immediate urgency for any philosophical or religious activity, and it was not just an anthropocentric turn in an intellectual climate that was losing confidence in biblical and positive dogmatic theology; rather, as for contemporaries like Lorenzo Valla, Marsilio Ficino, or Giovanni Pico della Mirandola but also in the footsteps of Augustine of Hippo (Secchi 2017), insight into the specificity of the human perspective was deemed to be the key to understanding as such, namely, relating to the natural world and the divine. Unsurprisingly, many of the *Sermons* explained humanity to the pious audience. For instance, *Sermo* 284 emphasized the twofold nature of Christ as confirmation of the resurrection of mortal humans, for every single person shares with Christ, who exemplified the essence of humanity, the same human nature. Not only was Christ a man but also God “inhabited” immortality in Christ. Cusanus concludes his *De coniecturis* with chapter II 17 “On Self-knowledge”. This is one of the sections that appear to anticipate modern rationalism. The intellect pursues the art of understanding, reason exercises its procedures, and senses operate their experience; and they all do so for the sake of preservation, nutrition, and adornment. However, they are equipped to operate only because they participate in the oneness, equality, and the connection of both that is bestowed on humans by the trinitarian God. Therefore again, understanding the workings of the human mind uncovers a glimpse of the divine while, at the same time, making methodical conjectures about the transcendence of God unpacks the essence of being human. Cusanus’ anthropology elaborates on the nature of being human as stretched out between the basic bodily life, including nutrition, and divine transcendence: being an image of God is not a vague promise or consolation for the misery on earth, it is the reality of human life that always

wavers between shortcoming and redemption. In two preceding chapters “On Humans” (II 14–15: *de homine*) Cusanus describes the variety of human behavior and achievements as a pendulum and comparable to rivers that keep flowing and yet never stay the same way, at times turbulent, at times calm, rising, and ebbing (Floss 2020, 147–66). The corporeal, sensual, rational, and intellectual are in cooperation. Moreover, the various peoples include some more spiritual and equally some more animalistic versions of humanity. One instance of this diversity within the one humanity is religion, which he describes even in terms of geography.

Religion

Religion only comes in diversity – this is the main message of *De pace fidei*. People live in diverse parts of the world with diverse traditions and necessarily with many individual leaders and prophets. God created humanity this way. Inevitably, societies tend to conflate truth and longstanding customs and despise others; eventually, cultures can turn to fanaticism. The task of a philosophy of religion is to show the way back to true faith and veneration (I). Willing people are in need of “manuduction” (being led by hand) toward concord (Bakos 2011). The author stages this human condition and the aim of restoring true worship of God as a conversation in heaven of representatives of many denominations and religions (among others a Byzantine, a Muslim, a Jew, and a Bohemian) with Saints Peter and Paul. The result is twofold, political and theological. Every nation is entitled to its peculiar tradition – as long as both faith and peace are preserved (XIX). The theological result is the claim that “there is no single religion, except in a variety of rites” (I). This, however, is the main assumption that is being corroborated in the entire debate and, consequently, its presupposition is the epistemological aspect of religion: all rites and cultures exist only because they do “presuppose” there being a God. Since Cusanus had always reiterated that access to the absolute depends on conjectural approaches, this also applies to the very existence of religion in all its instantiations. Religious war, it

turns out, is a contradiction in terms. Thus, Nicholas laid the basis of modern religious toleration. While in his *Catholic Concordance V* he had already remarked that the unity of faith is what ties diverging opinions together, he extended that to the human drive for truth and transcendence. The formula of “one religion – variety of rites” was inspired by reading the *Qur'an* and related sources (Pim Valkenberg in Levy et al. 2014). Therefore, in the *Scrutiny of the Qur'an*, he maintained – despite his critique of Mohammed – that a benevolent reading would find the truth of the Gospel in the *Qur'an* because there are many ways to pursue the good, which is one (Valkenberg 2019), so that it can be shown that what the Gospel teaches is confirmed in that book (*Cribratio Alcorani*, Prologue).

Impact and Legacy

Nicholas of Cusa had an impact on early modern mysticism but later his epistemology was in the foreground of studies. He was read by Renaissance authors, and particularly his “coincidence of opposites” was taken up when expressing the dialectics of finitude and infinity, Creator and creation, truth and method, and thus was welcome in a number of innovative or non-scholastic currents, including Christian Kabbala (Meier-Oeser 1989). The edition of Cusanus’ *Opera* (Paris 1514) by the humanist Jacques Lefèvre d’Etaples was paradigmatic of the appreciation of Cusanus among humanist mystics, including Charles de Bovelles (Emery 1984; Oosterhoff 2019; Yelena Matusevich in Izbicki and Bellitto 2002). The preface praised Cusanus’ humanist erudition and style in combination with his practical sense and mathematical achievements and their import on piety. Juan Luis Vives emulated Cusanus’ anthropology (Senger 2002, chap. 15).

Giordano Bruno adapted, among others, *De beryllo* and its geometrical examples, as well as the application of trinitarian theology to cosmology (Secchi 2006; Blum 2018; 2010, chap. 2). Nicholas’ *Sermons* were extensively appropriated in a book on number mysticism, the *Numerorum*

mysteria of 1599 (Bongo 1983; Blum 2010, 21–28). Also in a mystical context and serving the interests of religious groups, the *De visione Dei* and the *Idiota* dialogues were published in various English translations in the mid-seventeenth century (Blum 2018, 107–24). During the same time, the Bohemian philosopher and educator Jan Amos Comenius adapted Cusanian methods of mathematics and infinity in debates with Christian dissidents and took Cusanus as an inspiration for a non-substantialist interpretation of reality (Floss 2020, chap. IV; Petr Pavlas and Simon J. G. Burton in Burton et al. 2019). Gottfried Wilhelm Leibniz took many inspirations for Cusanus regarding potentiality (including possible worlds) and philosophical theology (Dall’Igna and Roberi 2013).

In 1730, the Jesuit Caspar Hartzheim published the first monograph on Cusanus, obviously meant to flatter the local authorities in Trier, Cusanus’ diocese; this study highlighted the mathematical and the political areas of his life. Other Jesuits were critical of Cusanus because, as it appears, his reflections on the end of the world and their implications for Christology and ecclesiology were supposed to be endorsed by the Jansenists in France (*Memoirs pour l’histoire des sciences et des beaux arts* [Journal de Trevoux], Mars 1715, 420–31, Oct. 1715, 2153–54, and Jan. 1734, 1–34). In the eighteenth century, interest in Nicholas of Cusa was triggered through the reception of Giordano Bruno: Bruno was supposed to be a forerunner of Baruch Spinoza, deemed to be an atheist. Readers like Johann Georg Hamann noticed the concept of coincidence of opposites in Bruno and searched for the sources in Cusanus (Volzhin 2018). The Enlightenment Protestant theologian Johann Salomo Semler published in 1787 a German translation of *De pace fidei* with the intent to overcome tensions between Protestant and Catholic denominations based on freedom of conscience (Nicholas of Cusa 1787).

In 1847, a Catholic opponent of modernism, Franz Jakob Clemens, presented Cusanus and Bruno as contrasting philosophers: Cusanus as the continuation of good medieval philosophy

and Bruno as a forerunner of Hegel (Clemens 2000). Analogously, about a century later in 1966, Hans Blumenberg used Nicholas and Bruno as contrasting figures to shed light on the threshold toward modernity from the theocentric to the anthropocentric, self-asserting mindset, the one before and the other after the passing of the threshold (Blumenberg 1983). Between Clemens and Blumenberg, Richard Falckenberg, in 1880, emphasized the modernity of Cusanus with a special interest in epistemology (Fiamma 2016b). Following him, Ernst Cassirer presented Cusanus as the first modern thinker because he transformed the tension between the finite and the infinite from dogmatic statements into the condition of human understanding as such. In one and the same move, Cusanus served in this book by Cassirer, “The Individual and the Cosmos in Renaissance Philosophy”, as the vehicle to convey the author’s distancing from Neo-Kantianism (Cassirer 2010). The German first edition in 1927 included the texts of Cusanus, *Idiota de mente*, and Charles de Bovelles, *De sapiente*. While these works appropriated Nicholas for the sake of a reassessment of the history of modern philosophy, Russian philosopher Simon Frank, in the 1930s, endorsed his philosophy systematically and claimed Cusanus to be his only teacher in his own attempt to overcome pragmatism and relativism by restoring the tradition of Christian Platonism. His book “The Unknowable” (German original version: *Das Unergründliche*) even features a chapter on ► “Docta Ignorantia” that profits from various formulas in Cusanus that bridge the gap between the concrete and the transcending, foundational otherness (Frank 1995; Frank 1983).

Nicholas of Modruš

Born: ca. 1425, Kotor

Died: 1480, Rome

Luka Špoljarić

University of Zagreb, Zagreb, Croatia

Abstract

Nicholas of Modruš was a Croatian bishop and intellectual, who after rising through the ranks in Croatia and Hungary spent the major part of his career in the Papal State. During his life, he authored at least eight works on various topics. Although initially he wanted to establish his name as a theologian and philosopher, he later developed a stronger interest in humanist rhetoric and historiography.

Alternate Names

[Nicholas Mahin of Kotor, Bishop of Modruš](#)

Biography

Nicholas was born around 1425 in Kotor, Venetian Dalmatia, into a well-off, though non-noble, family that drew origin from the Mahin clan based in the immediate hinterland. After presumably finishing elementary and secondary education in his hometown, he moved to Venice to pursue philosophical studies in the Scuola di Rialto under Paul of Pergola. He seems to have studied with Pergola from about 1448 until 1454/1455. His rapid rise began after his move to Croatia in 1456, where in 1461 he became bishop of Modruš, the most important bishopric of northern Croatia, and from where he came to enjoy regular contact with the Hungarian intellectual circle centered around John Vitez. After serving as papal legate in Bosnia and Hungary from 1463 to 1464, he relocated permanently to the papal curia. Over the next 16 years, until his death in 1480, he established himself as the chief representative of

the Illyrian national community, dividing his time between Rome and the provincial cities of the Papal State where he often served as governor. In Rome, he immediately formed close connections with Cardinal Marco Barbo and Pope Paul II, as well as with Cardinal Bessarion and his intellectual circle, while later he became one of the intimates of Pope Sixtus IV (Mercati 1937; Neralić 2003). During his career, he authored at least eight works on various topics, from philosophical treatises to speeches and works of history.

His first two works are philosophical-theological treatises written during the period he divided his time between Croatia and Hungary. His first known work, *Dialogue on the Happiness of Mortals* (*Dialogus de mortalium foelicitate*, 1462), is a dialogue set in the Scuola di Rialto with his teacher Paul of Pergola and two of his former fellow students, Domenico Bragadin and Giovanni Cesarini, acting as interlocutors. The dialogue, which was based in fact on the discussions that took place in Vitez's palace in Nagyvárad (Oradea), treats the question of whether a man can achieve his happiness in the mortal world through natural reason or only through divine revelation (Lepori 1987; Lepori 1980; Schiffler 1992; Banić-Pajnić 1998). The other of his first two works, *Peter's Barge* (*Navicula Petri*), was more modest in ambition. Written in 1463 in the form of an epistle, it explores the problem of physical evil, with Nicholas analyzing what he sees are five reasons why God incurs evil on humans. The prologue implicitly places the work in the context of the Ottoman conquest of Bosnia, which Nicholas, the last papal legate in the kingdom, barely escaped with his life (Špoljarić 2015a).

After his move to the papal curia in 1464, Nicholas continued to pursue philosophical topics in his works, at least initially. In 1465/1466 he finished *De consolatione* (*On Consolation*), which discusses the question of sorrow and methods of consoling (Jovanović 2002). The work blends Christian and Stoic ideas and is praised today as an important chapter in the history of writing about grief (McClure 1987; Jovanović 1999; Baltussen 2015). Nicholas's

next work, *On Humility* (*De humilitate*, 1470), is more enigmatic. It was dedicated to a woman who had taken religious vows, most probably Franciscan ones, but today is preserved only in manuscript fragments, which discuss nourishments, companion virtues, and fruits of humility.

Although the marginal notes in the books that belonged to his library show that he still continued to occupy himself with theological and philosophical questions in the privacy of his study (Špoljarić 2012), from the early 1470s Nicholas began writing about other topics. His later works include *On the Wars of the Goths* (*De bellis Gothorum*, 1472/1473), a history of the Gothic wars of late antiquity; the funerary oration for Cardinal Pietro Riario (1474) (Nicolaus Episcopus Modrusiensis 1474); a short treatise on the authors and themes of psalms (1476/1477); and an anti-Medicean propaganda piece, *Defense of Ecclesiastical Liberty* (*Defensio ecclesiasticae libertatis*, 1480). One should also mention here his Latin translations of Isocrates's orations *To Nicocles* and *To Demonicus* (after 1468), although these were in fact redactions of already existing translations (Špoljarić 2015b); he studied Greek with Bessarion's scribe Andronico Callisto, but he never seems to have developed anything more than an elementary knowledge of the language.

Although many of Nicholas's works often offer unique perspectives on the questions they address, they seem to have exerted little influence on contemporaries. Apart from his funerary oration for Pietro Riario, which owing to papal support became the most printed funerary oration of the fifteenth century, no work of Nicholas was printed during his lifetime, and most are today preserved in one or two manuscripts, usually either presentation copies or his own.

Abstract

Nicodemism can be generally defined as the practice of religious (dis)simulation in contexts of more or less open persecution. "Nicodemite" was the name that the sixteenth-century French reformer John Calvin gave to Protestants living in Catholic countries who chose to conceal their faith out of a concern for personal safety. In the 1540s and 1550s, the legitimacy of such behavior was at the center of a heated controversy stretching from Calvinist Geneva to nearby countries such as Italy, Germany, Holland, and France. While supporters of religious dissimulation invoked a range of scriptural and rational arguments in their own defense – including the illustrious precedent of the Roman Nicodemus, who believed in Christ but visited him only by night out of fear – prominent reformers such as Calvin denounced Nicodemism as morally inexcusable and strategically ruinous for the long-term development of Reformed churches. Historically, the emergence of Nicodemism as a particular form of religious dissimulation buttressed by scriptural and rational arguments is inextricably tied to the specific circumstances of religious life in the Reformed and philo-Reformed milieus of mid-sixteenth-century Europe. Modern historiographical discourse, however, has often stretched the term Nicodemism well beyond its context of origin, in ways that have not failed to raise debate and

that ultimately reflect underlying disagreements about the meaning and essence of Nicodemism itself.

Heritage and Rupture with the Tradition

The term “Nicodemism” derives from the word “Nicodemite,” one of several labels used in sixteenth-century Europe to designate religious dissemblers, particularly Protestants who lived in Catholic countries and chose to keep their faith secret in order to escape persecution. The earliest documented instance of the term “Nicodemite” is found in a 1544 tract by the French reformer John Calvin, *Excuse à Messieurs les Nicodemites*, which was later translated into Latin by Calvin himself (*Excusatio ad pseudo nicodemos*, in Calvin 1549) and into Italian by Lodovico Domenichi (*Escusazione a’ Nicodemiti*, in Calvin 1550) (on these translations, see Garavelli 2004; Zuliani 2015).

In the *Excuse*, as in other writings from around the same period, Calvin censured the behavior of all those “lukewarm” Christians who would rather bury their faith deep in their hearts than put their life, freedom, or fortune in danger. What was even worse in Calvin’s eyes was the fact that such disingenuous “crypto-Reformed” sought to justify their position on the level of principle, by invoking a range of scriptural and rational arguments in defense of religious dissimulation – including the illustrious precedent of the Roman Nicodemus, who believed in Christ but visited him only by night out of fear (John 3:1–15). It was indeed their appropriation of Nicodemus’s example that earned them Calvin’s scornful (and not entirely unproblematic) nickname of “Nicodemites” (Zuliani 2015).

In a series of writings later collected under the title of *De vitandis superstitionibus* (“On Avoiding Superstitions”, 1549), Calvin debunked the Nicodemites’ arguments for religious dissimulation one by one. To their adiaphoristic spiritualism, which played down the importance of outward ceremonies and doctrinal complexities in favor of a simplified form of inner faith, Calvin opposed a powerful “either with us or against us”

narrative that ruled out the possibility of any compromise between Roman idolatry and the true faith of the “people of God.” Strongly condemning dissimulation as duplicitous behavior unworthy of a true Christian, Calvin called on all persecuted Protestants to either take the route of exile or steadfastly embrace a martyr’s death (Eire 1986; Shepardson 2007).

While the exact polemical targets of Calvin are difficult to identify with any certainty, the work of several generations of scholars has revealed that they may have included a range of heterogeneous groups rooted in different geographical contexts and animated by different motives: French evangelicals and *moyenneurs* (Turchetti 1984; Causse 1986; Wanegffelen 1995, 1997); Italian heretics (Caponetto 1974; Simoncelli 1979; Firpo 1984; Turchetti 1987; Cantimori 1992; Garavelli 2004; Firpo 2007); Dutch spirituals (Eire 1986); and also (though to a lesser extent) German Protestants (Eire 1986). In Germany, Calvin’s work intersected with that of homegrown Protestant leaders such as Wolfgang Musculus, whose 1549 polemical dialogue *Prosaerus* – written in the aftermath of the Augsburg Interim of 1548 and rapidly translated into French (*Le temporiseur*, 1550) and English (*The Temporisour*, 1555) – addressed issues of compromise and dissimulation much in the same vein as Calvin’s anti-Nicodemite writings did (Ginzburg 1970).

Innovative and Original Aspects

One aspect that has come to the fore thanks to the aforementioned studies is the Europe-wide significance that Calvin’s anti-Nicodemite writings were intended to have – and did in fact have. Looking at the Nicodemite controversy from a transnational perspective sheds some helpful light on the long-debated question of Nicodemism’s origins, a question that has traditionally been addressed from a national (not to say nationalistic) perspective. For the Italian scholar Delio Cantimori, whose groundbreaking studies contributed to creating Nicodemism as an object of study in the mid-twentieth century (Cantimori

1959a, b, 1992), Nicodemism was an essentially Italian phenomenon, tied to the particular conditions of religious life in the peninsula during and after the Council of Trent (1545–1563). While Cantimori's position was subsequently adopted and developed by a number of scholars (Rotondò 1967; Caponetto 1974; Simoncelli 1979), it did not encounter unanimous consensus. Alternative views included Albert Autin's franco-centric narrative (1910), also followed by Eugénie Droz (1970–1976) and Maurice Causse (1986) and Carlo Ginzburg's ingenious thesis of a German birth of Nicodemism, expounded in a field-changing monograph of 1970. Here Ginzburg argued that something very close to the theoretically justified dissembling behavior denounced by Calvin in the 1540s had already taken shape among the German Anabaptists in the aftermath of their crushing defeat in the Peasants' War of 1524–1525. According to Ginzburg, at the origins of the Nicodemite movement was a German botanist of heretical inclinations named Otto Brunfels. Brunfels's writings contain references to the same scriptural passages on which the later generation of Nicodemites targeted by Calvin allegedly based its defense of religious dissimulation – including the notorious episode of Nicodemus in John 3:1–15, as well as various passages from the Old Testament and from Paul's Epistles.

Ginzburg's approach was to some extent a continuation of that of Cantimori, in that it similarly implied the rejection of Calvin's identification of the Nicodemites with the crypto-Reformed and replaced it with a counter-genealogy that emphasized the heretical matrix of Nicodemism. Like Cantimori, Ginzburg portrayed Nicodemism as a conduct typically adopted by nonconformist groups pursuing heterodox forms of religious spirituality that made them unwelcome to the established churches on both sides – the Roman Catholic as well as the Protestant in its many forms. By shifting the focus from Italy to Germany, however, Ginzburg was not simply replacing one national narrative with another, as previous scholars had generally done; he was also moving past it, highlighting the

existence of deeper commonalities between Italian and German heretical movements tied to the history of religious dissimulation (1970: 159–181), as well as suggesting possible links with the French side of the story (1970: 182–205).

Ginzburg's thesis has since been criticized on many levels (Biondi 1974; Eire 1979, 1986). One particularly penetrating critique (Bietenholz 1990) has taken issue with Ginzburg's adoption of selected elements from Calvin's portrait of the Nicodemite (viz., the use of specific scriptural passages as arguments for religious dissimulation) as a heuristic framework for identifying Nicodemite tendencies *before* Calvin. In addition to flagging this retroactive fallacy, Bietenholz raises crucial methodological questions regarding the legitimacy of relying on negative descriptions derived from polemical sources (such as Calvin's portrait of the Nicodemite in his anti-Nicodemite writings) for modern historiographical work.

Other aspects of Ginzburg's work on Nicodemism proved more fruitful and long-lived. His 1970 monograph, in particular, paved the way to a “transnational turn” in the study of Nicodemism, which encouraged later investigations of Nicodemism as a unified, though far from monolithic, pan-European phenomenon – one whose geographical and chronological boundaries far exceed the span of the original Nicodemite controversy of the 1540s–1550s (Biondi 1974; Bietenholz 1990; Cavaillé 2012b; Wanegffelen 2013). As a result of these new research trends, the last few decades have seen a deep transformation of the scholarly debate on Nicodemism. In the last 20 to 30 years, scholars have stretched the term Nicodemism well beyond its context of origin, in ways that ultimately reflect underlying disagreements about the meaning and essence of Nicodemism itself. Nicodemite attitudes have been ascribed to a number of individuals and groups active in different historical contexts, such as Catholics in Elizabethan England (Pettegree 1996; Tutino 2006), Marranos and Moriscos in early modern Spain (Firpo 1994; Schwartz 2008), and religiously heterodox thinkers such as Jean Bodin and Isaac Newton

(Quaglioni 1984; Snobelen 1999). In some cases, the very notion of Nicodemite has been thoroughly reconceptualized so as to include not only strategic dissemblers waiting for more favorable circumstances to declare their true faith but also a wide range of non-aligned religious groups permanently resisting confessional polarization in the so-called age of confessionalization. Following up on earlier work by Carlo Ginzburg (1970) and Mario Turchetti (1984), both of whom identified connections between Nicodemite practice and a certain penchant for adiaphorism, irenicism, and religious compromise, some scholars have proposed to use Nicodemism as an umbrella concept for all those who “chose not to choose” in a world characterized by increasing religious tension and polarization (Wanegffelen 1997, 2013; Cavaillé 2012b). In its most radical form, this approach changes the very essence of what we mean by Nicodemism: in this view, what defines Nicodemism in the first instance is not so much the practice of religious dissimulation (whether theoretically informed or not) but rather a particular understanding of the Christian faith (already advanced by thinkers like Erasmus, Juan de Valdés, and Martin Luther) that places more importance on interiority than exteriority, thus reducing the importance of rites and other forms of public display of one’s faith (Belladonna 1980a; Bietenholz 1990; Firpo 1990).

Impact and Legacy

One consequence of the semantic expansion of Nicodemism in recent scholarship is that the term can now be used to think cohesively about the many forms of (and disputes about) dissimulation and nonconformity that arose in various places and at various times in early modern Europe. While the extent to which the term Nicodemism may legitimately be generalized beyond its context of origin remains an open question (Biondi 1974), reappraising the Nicodemite phenomenon as part of broader

debates about secrecy, (dis)simulation, and “ways of lying” (Zagorin 1990, Pettegree 1996; Cavaillé 2009; Snyder 2009; Eliav-Feldov 2012) – as well as part of a general reaction to institutional attempts at disciplining the inner life of individuals (Prosperi 2009) – has enabled scholars to better appreciate the place of Nicodemism in early modern European culture at large. (For a rich, though not exhaustive, bibliography of scholarship on Nicodemism, see Cavaillé 2012a.)

Such broader, contextual approach to Nicodemism is not only heuristically productive but can also be defended on historical grounds. In the sixteenth and seventeenth centuries, dissimulation was a topic debated in a number of fields, ranging from religion to politics, ethics, and aesthetics (Belladonna 1975, 1980b; Ascoli 1999). While it is certainly important to determine what (if anything) sets Nicodemism apart from other forms of dissimulation, it must also be acknowledged that a clear distinction between different types or degrees of dissembling behavior was not always made in the early modern period. At times of intensified civil tension, such distinctions were often deliberately obscured for polemical purposes: during the French civil wars of the later sixteenth century, for instance, Huguenot and Catholic pamphleteers took turns conflating classic anti-Nicodemite commonplaces with a harsh condemnation of “Machiavellian” simulation (Battista 1962; Vivanti 1963).

More attention to the ways in which dissimulation was appropriated as a polemical weapon in contexts that were simultaneously political and religious would shed much-needed light on the afterlife of the Nicodemite controversy in the latter half of the sixteenth century – and beyond. One way to do this would be to examine how the reception of (in)famous texts such as Machiavelli’s *Prince* or Tacitus’s *Annals* (both of which discussed dissimulation as an essential component of statecraft) may have overlapped and interacted with the later circulation of Calvin’s and Musculus’s anti-Nicodemite texts. More generally, reception is an angle from which such debates have rarely been

studied, and we can expect significant progress in this area in the future.

Abstract

Agostino Nifo is one of the few philosophers who have commented on all the logical works of Aristotle and one of the philosophers who have commented on the largest number of works of the Stagirite.

Nifo's reflection marked him in Renaissance thought as an important exponent of Aristotelianism, which he interpreted in an eclectic manner according to the principles of Averroism, Thomism, and Neoplatonism.

In his 56 works, he made a fundamental contribution to sixteenth-century philosophy in the fields of logic, methodology, the doctrine of knowledge, the theory of the immortality of the soul, metaphysics, astrology, meteorology, natural philosophy, medicine, morals, and politics. He compared his ideas on these issues to those of some of the major thinkers of his time such as Pietro Pomponazzi, Giovanni Pico della Mirandola, and Niccolò Machiavelli.

Biography

Regarding the reconstruction of the life of Agostino Nifo, it is essential to remember that no credible evidence regarding the years prior to his arrival in Padua has been found.

Reliable information about his life after this event has been obtained mainly from the archives of the universities in which he carried out his academic activity: Padua, Salerno, Naples, Rome, and Pisa. The first documented information can only be found in the records of the registers of the *Sacrum Collegium Artistarum Medicorum*.

Agostino Nifo was probably born in Sessa Aurunca in 1469, even if the only evidence of this, that has come down to us, is in biographies, published, or manuscripts, in which reference is made to documents of which there is no longer any trace. Tommaso De Masi declared that he examined the notarial deeds and the property

registers which revealed the structure of the Nifo family, whose offspring includes, in addition to Agostino, a sister named Beatrice and a brother named Vincenzo (De Masi del Pezzo 1761, pp. 105–107).

Little is known about Nifo's youth. According to biographical reconstructions, he was first taught by a tutor named Antonio Calcidio, also from Sessa, a humanist renowned for his knowledge of classical literature (Minieri Riccio 1844, p. 69).

The date when Nifo obtained his degree is unknown because in the register of degrees, in record number 317, which attests the doctoral exams taken at the University of Padua from August 1489 to November 21, 1492, there is no sign of any exams taken by Nifo (Sacrum Collegium 1492), nor does his name appear in the exams reported in the previous record, number 316, which contains all previous documents from 1488 (Sacrum Collegium 1489).

The first indication of Nifo's academic activity can be found in record number 649 relating to the year 1492, in which, on *folio* 269, it is reported that Nifo is a Professor *secundi loci* of *Philosophia Naturalis* (Sacrum Collegium 1499b, f. 269).

Nifo held this position until October 9, 1495, when he became Full Professor *secundi loci* of *Philosophia Naturalis*. This step is indicated on *folio* 386 of record number 648, in which it is specified that in 3 years between 1492 and 1495, he never left the University of Padua (Sacrum Collegium 1499a, f. 386).

In 1496, another important event in Nifo's academic career took place, as Pietro Pomponazzi gave up *lectura ordinaria* and left his place to Nifo who became Full Professor *primi loci*. His *concurrans* was Antonio Fracanzano who directly became Full Professor *primi loci* in 1497 when Nifo left Padua (Sacrum Collegium 1499a, f. 388).

Therefore, it can be affirmed with some degree of certainty that Nifo was a professor at the University of Padua from 1492 to 1497 without interruption. A note on a small sheet of paper, bound between *folio* 269 and *folio* 270 of

record number 649 of the Ancient Archive of the University, contains the information that on April 17, 1497, he certainly still held the position of Full Professor of *Philosophia Naturalis* (Sacrum Collegium 1499b, ff. 269–270). However, the following year he probably left the teaching position.

Regarding the dates of completion of the works, the first written work completed by Nifo is *De animae beatitudine*, completed in Padua on May 14, 1492. Also in *Patavino Studio*, on August 26, 1492, he completed *De intellectu*. Nifo's first published work, *Destructiones destructionum*, was also written in Padua, begun in 1494 and completed on January 22, 1497, and printed for the first time in Venice by the publisher Boneto Locatelli, commissioned by Ottaviano Scoto, on March 1, 1497. *Quaestio de sensu agente* was completed in Padua on May 15, 1495, and printed along with *Destructiones destructionum*. Moreover, the first edition of *De anima* can also be attributed to the Paduan period, though it was finished in Sessa on September 12, 1498, and printed in Venice by Pietro de Querengis, commissioned by Alessandro Calcedonio, on May 10, 1503. In the same year, *De intellectu* was also printed along with *De demonibus* in Venice, by Pietro de Querengis on August 3, 1503.

However, we should remember that, while the chronology of the printed editions of Nifo's works can be established with certainty, it is less easy to define the precise order of the drafting of his texts, especially regarding the production of his early years at the University of Padua, since Nifo may have felt the need to backdate the composition of some of his writings to dispel any suspicion of heresy following the warning issued by Pietro Barozzi.

Nifo made his debut in the cultural scene of his time as an orthodox follower of Nicoletto Vernia's Averroism and, as an Averroist, was involved in the warning issued on May 6, 1489, by Pietro Barozzi, the Bishop of Padua, who, in agreement with the inquisitor Fra' Martino of Lendinara, forbade any public discussion on the subject of the unity of the intellect, the central theory of Averroistic psychology.

In his commentary on *Destructiones destructionum Algazelis* by Averroes, Nifo sought to find matching features of Plato's reflection and that of Averroes, in tune with the dominant approach in Italian philosophical meditation between the fifteenth and sixteenth centuries that aimed at reconciling different philosophical doctrines.

The subject of the dispute was the attribution of the theory of the unity of the intellect to Plato by Al-Gazali. This theory opened a small controversial door to the possibility of reconciling the theory of the unity of the soul with that of the multiplicity of souls. According to Nifo's account, Giovanni Pico della Mirandola fully shared Al-Gazali's interpretation and gives an example to support his position. Pico recalls that a scaffold is necessary in order to construct an arch; the scaffold is removed once the work has been completed after it has contributed to giving shape to the arch. In the same way, there is only one form, which is the same for all souls and which supports the growth of individual bodies; this is the unique intellect, and, after the completion of human development, it leaves only a shadow of itself that is the individual soul (Nifo 1497, cc. 20r–21v).

On the other hand, Aristotelianism itself, especially Averroism, does not exclude the influences of Platonic thought. At the University of Padua, it was Nifo himself who introduced Sigerian doctrine, and it was his reflection that led to the deepening of this thought by Pico.

The prevalence of Averroistic doctrines within the University of Padua led Paduan scholars, including Nifo, to address much-discussed issues such as the debate on the veracity of the theory that the intellectual soul is a substantial form of the human body.

According to the Averroistic doctrine, the active intellect, which completes the cognitive process, and the potential intellect, which is the highest of the cognitive faculties of man, enjoy a separate existence; this attributes to the soul an eternal but impersonal existence and therefore appears to the exponents of Thomism as extremely risky on the ethical level. In fact, it excludes the possibility that the earthly behavior

of man may have repercussions on receiving reward or punishment in the afterlife, to which the soul would have access exclusively on the basis of the acquisition of the universal principles of human knowledge.

However, taking up the thought of Thomas Aquinas, the Thomists reaffirmed, as is well-known, that the intellectual soul is a substantial form of the body and this involves both individual immortality and responsibility on the ethical level of conduct.

Nifo, for his part, believed that the Sigerian doctrine could be an effective mediation between the theory of Averroes and the doctrine of Thomas.

Indeed, Nifo was the most important exponent of Sigerian doctrine of the sixteenth century. He was the only one who knew some of the fundamental texts of Siger of Brabant and still today, represents the main source to whom one must turn for the reconstruction of the fortunes of Siger in the sixteenth century.

It follows that, despite the fact that Siger of Brabant was the objective of Thomas's criticism of Averroism, Nifo found in Sigerian doctrine a thought that was versatile and appropriate to the solution of the complex issues that animated the psychology of his time. He supported the Sigerian doctrine according to which the intellect, though separate, remains as a form of the human body, and, to defend this position, he identified and distinguished two functions present in the cognitive process: the intellect and the *cogitativa*. According to this theory, the potential intellect remains unique for the whole human species, but, in order to make its potentiality an actuality, it needs to be united at all times with each individual who puts it in contact with the universals of the *species sensibiles*. The *cogitativa*, on the other hand, guarantees the union between the potential intellect and the *species sensibiles* because it is the highest faculty of the sensitive soul and is responsible for ensuring the potential intellect the right conditions to make its cognitive potentiality an actuality. It follows that the *cogitativa* establishes the cognitive act, abstracting the *species sensibiles* from sensations and preparing the conditions for the intervention of the intellect

that, passing from potentiality to actuality, completes the cognitive process. According to Nifo, the potential intellect, on the one hand, participates in individual cognitive acts and multiplies its interventions by the number of individuals and their processes of knowledge of the conceptual universals, and on the other hand, remains separate while retaining its uniqueness and individuality. It is in this that the mediation between Averroism and Thomism is realized, given that the intellect remains unique, indivisible, and immutable, according to Averroistic doctrine and, at the same time, participates in the cognitive process as a form of the human body, guaranteeing the individuality of the intellectual act as prescribed by Christian orthodoxy and Thomistic doctrine (Nifo 1503a, cc. 64r–70r).

Nifo supports the theory that the union of the intellect with individuals makes the intellectual soul become a substantial form inherent in man and not just an assistant form. On the other hand, the moment when the potential intellect is activated both by these forms that have become intelligible and by the systematic study of the sciences in which the intelligible forms are articulated in specific contents, the human soul reaches the divine bliss that consists in the conjunction of the human intellect with the active intellect (Nifo 1522, cc. 159r–v).

Moreover, Nifo points out that a logical-gnoseological procedure like the one implemented by human knowledge also has important consequences on the metaphysical level. At the very moment of human beatitude, God becomes the form of the blissful intellect which is, in turn, the form of the human body. It follows that a predominantly cognitive process creates the spread of divine beatitude that propagates, by means of man, throughout the earthly world (Nifo 1508b, c. 20r).

Nifo spent the period from 1500 to 1507 between Sessa and the University of Naples. He taught at the University of Naples from April 1, 1504, to December 31, 1505 (Cannavale 1895, p. 270).

In 1503, the town of Sessa was besieged by a terrible plague. Nifo describes this terrible episode of his life in *De nostrorum calamitatum*

causis, which he completed in Sessa on July 20, 1504; it was printed in Venice by Ottaviano Scoto on April 3, 1505. In the work, the author focuses on analyzing the causes of the epidemic and concludes that the responsibility for the infection lay with the Spanish army, which camped for 40 days near the city and spread the disease throughout the region. Almost all the events of the Franco-Spanish conflict are described in detail in many of its phases in *De nostrarum calamitatum causis*, also with reference to the astral influences that could have determined them (Nifo 1505b, c. 2r).

Moreover, in Sessa on February 22, 1504, Nifo completed another work dealing with astrological matters, *De diebus criticis seu decretoriis*, printed in Venice by Alessandro Calcedonio on October 15, 1504.

In both works, the author confirms his confidence in the reliability of astrology, thus conforming to the trend prevailing in the scientific culture of his time (Nifo 1504, cc. 14v–15r).

The main criticism Nifo made of horoscope writers highlights the fact that they venture into risky predictions without following the guidance of the first of the masters of the science of the sky, Ptolemy, to whom he dedicated a work entitled *Ad apotelesmata Ptolomei eruditiones*, which was printed in Naples, by Pietro Maria de Richis on April 23, 1513 (Nifo 1513).

On November 17, 1504, in Sessa, Nifo also completed *Quaestio de infinitate primi motoris*, the central theme of which was the relationship between God and the universe. In this text, Nifo compares the physical laws governed by God and His divine essence and makes a clear distinction between the Prime Mover as an aim, on the one hand, and as a form and an agent cause, on the other. He comes to the conclusion that, since the Prime Mover is only an aim, He has no quantity, either as substance or concept, since He is clearly distinct and separate from the universe. Rather, since God is the form and cause agent of the universe, He must be considered finite because the universe moved by Him is finite and, consequently, the action exerted on it is also finite (Nifo 1526c, cc. 109r–113r).

On August 13, 1505, in Venice, Alessandro Calcedonio printed the work entitled *In duodecimum metaphysices Aristotelis et Averrois. On April 3, 1505, in Venice, Averrois de mixtione defensio* was printed by Ottaviano Scoto.

From December 31, 1505, until 1507, Nifo stayed in Sessa again. It was here that on May 15, 1506, he completed the *Aristotelis physicarum acroasum*, and on August 22, 1507, he placed the *explicit* to *De substantia orbis*.

In 1507, Nifo began teaching at the University of Salerno, where he remained until 1510 (Nifo 1511, c. 444) and where he started writing *Metaphysicarum disputationum dilucidarium* commissioned by Prince Robert II Sanseverino. On November 28, 1507, in Venice, *Aristotelis perihermenias hoc est de interpretatione* was printed by Ottaviano Scoto, and the following year three works were printed in Venice by Ottaviano Scoto: *De animae beatitudine* on December 23, 1508, *Aristotelis physicarum acroasum* on August 26, 1508, and *De substantia orbis* on December 29, 1508.

In the years between 1510 and 1514, it is very probable that Nifo stayed in Sessa again but that he also moved to Rome. In this city, on August 20, 1510, he began to write *De figuris stellarum helionoricis*, while in Sessa he wrote the *explicit* on February 4, 1511. In the same year, on September 1, Sigismondo Mayr printed *Metaphysicarum disputationum dilucidarium* in Naples, which had been completed in Naples on March 27, 1510.

The following year, on June 12, 1512, Nifo completed, in Sessa, *De divinatione naturali, artificiosa et de prophetia* which is the tenth work of the *Parva naturalia*, a *collectanea* that would be completed almost 10 years later. On October 15, 1514, in Sessa, Nifo also completed *De coelo et mundo*, which was printed in Naples by Sigismondo Mayr on March 23, 1517.

In 1514, Nifo taught at the University of Rome, where he was Full Professor *primi loci* of *Philosophia* and where he stayed until 1519, when he went to teach at the University of Pisa (Renazzi 1803, I, p. 45).

On October 27, 1518, with *De immortalitate animae*, printed in Venice by the heirs of

Ottaviano Scoto, Nifo returned to participate in the philosophical discussions, at the invitation of Pope Leo X, this time setting himself as a prestigious antagonist of Pietro Pomponazzi.

The famous dispute over the nature and destination of the human soul began, as is well-known, with the publication of Pomponazzi's *De immortalitate animae*, which was published in Bologna on November 6, 1516. The author chose an Alexandrist interpretation of Aristotle's *De anima* and went as far as to propose a naturalistic ethic in harmony with a general mechanistic vision of nature. However, a consequence of this interpretation is also an implicit adherence to the theory of the mortality of the soul and, therefore, to an anthropology based on the recognition of values that are entirely earthly.

Nifo's reply, on the other hand, was more nuanced and fluctuated between Averroism, Platonism, and Thomism. He knew very well that the contrast between Alexandrism and Averroism was less clear than it may have seemed at first sight, also because both doctrines supported an interpretation of Aristotle that was free from theology and speculative metaphysics, toward which, instead, the Thomistic tradition inclined. Therefore, Nifo started from an eclectic position in defense of Catholic orthodoxy and, in response to Pomponazzi's objections to Thomas Aquinas, made use of the well-known Platonic argument on the soul, according to which if the soul is similar to the idea, it is not possible to bind it to matter.

Pomponazzi also went as far as to support an ethic that was completely free from metaphysical conditioning. He countered the objection that denial of the immortality of the soul would have repercussions on the moral life, inasmuch as it would make the belief in the reward or punishment of the afterlife disappear, with the argument that virtue and vice bring their reward or their punishment in themselves. By making human beings happy, virtue compensates them for the efforts they have made to pursue it; vice, on the other hand, brings with it the breaking of the harmony of the soul and, therefore, the punishment of unhappiness. Pomponazzi's criticism was directed precisely at the Platonists who,

while sustaining the dignity of human beings then deprive them of their prerogatives, since they put forward a theory according to which the perfection of moral action depends on a transcendent reality (Pomponazzi 1516).

Instead, Nifo used Platonism in his refutation of Pomponazzi in that he reiterated that, while it is true that looking for good is beautiful and heroic, it is in this yearning to sublimate oneself that one can see the most reliable testimony of the presence of the transcendent in human nature. By forming man, God lifted his gaze from the ground so that, through the observation of the sublime, he could reach the contemplation of his Maker (Nifo 1518, c. 20v).

In 1519, Nifo finished teaching in Rome and began at the University of Pisa, where he taught as a Full Professor of *Physica* until 1522 (Fabroni 1791, I, pp. 313–319).

He participated immediately in the discussions of the time that took place in the Tuscan academic circles. Europe and Italy, and Florence in particular, were involved in a heated dispute over the astrological argument because the conjunction of Jupiter and Saturn in Pisces, forecast for February 1524, was interpreted by most astrologers as the prediction of an imminent universal flood.

The dispute between astrologers, philosophers, doctors, and various men of culture seems to have originated in a booklet of 1512 by the Italian physician and mathematician Luca Gaurico, who arrived at the flood hypothesis by analyzing some points of the ephemeris (Gaurico 1512).

A few years later, in *De falsa diluvii prognosticatione. Quae ex conventu omnium planetarum, qui in piscibus continget anno 1524, divulgata est*, printed in Naples by Giovanni Pasqueto on December 24, 1519, Nifo affirms that belief in the flood was already widespread among the masses but concludes that the only concrete possibility is that of modest floods of a local nature (Nifo 1519).

On May 1, 1520, in Pisa, Nifo completed the second edition of *De anima*. On July 17, 1520, Leo X gave Nifo the privilege of including the insignia of the Medici family in his family coat of

arms and of joining his surname to that of the Medici. In August 1520, *Dialectica ludicra* was printed in Florence by the heirs of Filippo Giunta.

On January 28, 1521, in Pisa, Nifo completed the first edition of *Epitomata rethorica ludicra*. On April 3, 1521, in Pisa, *De generatione et corruptione* was completed and printed, together with *Quaestio de infinitate primi motoris*, in Venice, by the heirs of Ottaviano Scoto, on April 28, 1526. On April 3, 1521, in Florence, the heirs of Filippo Giunta printed *De his quae ab optimis principibus agenda sunt*. On October 23, 1521, the first edition of *Epitomata rethorica ludicra* was printed in Venice by Filippo Pincio.

In the same year, 1521, the works included in the *Parva naturalia* were completed in Pisa and printed in Venice by the heirs of Ottaviano Scoto on March 2, 1523. On April 25, 1521, he finished *De iuventute et senectute*, which is the fourth work of the *Parva naturalia*; on May 3, 1521, he completed *De animalium motu*, which is the second work of the *Parva naturalia*; on May 14, 1521, he finished the *De respiratione*, which is the fifth work of the *Parva naturalia*; on May 27, 1521, he finished *De memoria et reminiscencia* which is the seventh work of *Parva naturalia*; on May 28, 1521, he completed *De morte et vita* which is the sixth work of *Parva naturalia*; and on December 10, 1521, in Sessa, he completed *Physiognomicorum libri* which is the first work of *Parva naturalia*. On April 15, 1522, in Pisa, *De longitudine et brevitate vitae*, the third work of the *Parva naturalia*, was completed. *De somno et vigilia* which is the eighth work of the *Parva naturalia* and *De insomniis*, which is the ninth work of *Parva naturalia* have no completion date.

On May 13, 1522, the second edition of *De anima* was printed in Venice by the heirs of Ottaviano Scoto.

In the same years, between 1521 and 1522, Nifo wrote three political works: the cited *De his quae ab optimis principibus agenda sunt*; *De regnandi peritia*, which was completed on October 3, 1522 in Sessa and printed on March 26, 1523, in Naples by Caterina De Silvestro; and, finally, *De rege et tyranno*, which was printed

on January 23, 1526, in Naples by Evangelista Papiense.

De his quae ab optimis principibus agenda sunt belongs to the genre of precepts, widely used in the Renaissance, which gives guidance on the training, behavior, practical, and moral skills that the prince should possess. The ideal image proposed is that of a strong and refined prince, trained in physical stamina by hunting and gymnastics and inclined to good taste through literature, painting, and music (Nifo 1521b, p. 27).

De regnandi peritia is known to critics as plagiarism of the more famous *Il principe* by Niccolò Machiavelli, although it should be noted that Machiavelli's work was printed long afterwards, in 1532 (Machiavelli 1532a).

De regnandi peritia is written in Latin and, from the point of view of plagiarism, on careful reading, it emerges that it should be considered as a revision of the theories proposed by Machiavelli through Aristotelian doctrine until a recovery of the ethical dimension in opposition to the radical realism of Machiavelli's reflection is reached. Therefore, Nifo indicates the rules that a good prince must follow in the government of the state. He must distinguish himself from the tyrant and must be a Christian prince, since Nifo censors Machiavellian expressions that are contrary to or disrespectful of religious precepts. Moreover, *De regnandi peritia* is also a treatise on forms of government that privilege Aristotelian doctrine over the historical and military reality highlighted by Machiavelli. It ends with a clear opposition between the kingdom and tyranny, thus supporting an ethical vision of politics (Nifo 1523a).

In 1522, Nifo finished teaching at the University of Pisa and moved back to Salerno.

In the same period, in Sessa, he completed his commentary on *Posteriora analytica* on April 18, 1522, while the work was printed in Naples on January 3, 1523, by Caterina, wife of Sigismondo Mayr. With this text and the commentary on the *Priora analytica*, completed in Salerno on March 27, 1524, and printed on March 14, 1526, in Naples, by Evangelista Papiense, Nifo made the final arrangement to his logical doctrine.

Moreover, Nifo reaffirmed the excellence of the analytics in that only the demonstration, set up as a strictly scientific syllogistic procedure, can follow the laws of causal inference which guarantee the scientific nature of the investigation beyond any contingency and accidentality.

As is well-known, the causal connection can be reconstructed by resolutive means, i.e., by rising from the effect to the cause, or by compositional means, i.e., by going down from the cause to the effect. If we use the resolutive method, proceeding from the particular toward the universal, we carry out the analytical procedure typical of the *demonstratio quia*. If we use the compositive method, proceeding from the universal to the particular, we realize the synthetic procedure typical of the *demonstratio propter quid* (Nifo 1523b, c. 41r).

Nifo underlines the need for a method in which the connection of the two demonstrations is realized through the conversion of their medium terms, and this procedure takes the name of *regressus demonstrativus*. In *regressus* the *demonstratio quia* and the *demonstratio propter quid* bind together, thanks to the conversion of the medium term that takes on the role first of effect and then of cause and allows a concatenation of the *ordo mentalis* with the *ordo realis* to be created.

We should remember that the *regressus demonstrativus* also carries out the conciliation of *prius nobis* and *prius naturae*. Indeed, what appears first in knowledge does not in itself coincide with what is more certain, since natural phenomena occur in a succession in which the effect arises from its cause; consequently, according to the natural order, it is the effect that always presupposes the cause. However, this order of cause and effect is overturned for the person who knows, to whom the effects appear first, followed by the causes (Nifo 1523b, c. 13r).

For this reason, according to Nifo, the *negotiatio intellectus* has a central role, in which the intellect grasps the cause regardless of the data coming from the senses and evaluates it exclusively on the basis of its rational foundation

in order to insert it effectively in the sphere of scientific syllogism.

On April 5, 1523, in Salerno, Nifo completed *In libris Aristotelis meteorologicis* and *De mistis* which was printed in Venice, by the heirs of Ottaviano Scoto, on October 26, 1531.

On January 11, 1524, in Salerno, he completed *De auguriis*, which was printed in Bologna by the heirs of Girolamo De Benedictis in 1531.

Subsequently, on August 3, 1525, in Sessa, Nifo completed *De armorum literarumque comparatione* and *Apologia Socratis et Aristotelis*. On May 8, 1526, *De armorum literarumque comparatione*, *De inimicitiarum lucro*, and *Apologia Socratis et Aristotelis* were printed in Naples by Evangelista Papiense. On May 12, 1526, *De figuris stellarum helionoricis* was printed in Naples by Giovanni Pasqueto. On August 8, 1526, in Sessa, *De verissimis temporum signis* was completed.

On July 16, 1528, in Sessa, Nifo completed the work *De ratione medendi*. This text is particularly important because it summarizes his medical practice which is based on the fact that the treatment of the disease cannot be separated from the identification of its causes, and, in order to be able to trace what caused certain effects, we must know how to recognize the symptoms. In this perspective, the symptoms are to be found exclusively in the internal nature of the patient, that is, in the individual disposition to the disease. Therefore, diagnosis of the disease must be achieved essentially by identifying the internal causes and signs that characterize it (Nifo 1551, cc. 9r–v).

In 1525, Nifo taught at the University of Salerno under the protection of Prince Sanseverino (Sinno 1921).

In 1528, he received honorary citizenship of the city of Naples and in 1531 he resumed teaching at the University of Naples as the chair of Medicine and Philosophy where he remained until June 12, 1532 (Cannavale 1895, pp. 63, 183).

During this period, Nifo completed other works. On November 3, 1529, in Sessa, he

finished *De pulchro et de amore*, printed in Rome by Antonio Blado in 1529.

Subsequently, Nifo completed the five works included in the *collectanea* entitled *Prima pars opusculorum in quinque libros divisa secundum varietatem tractandorum*, printed in Venice by Ottaviano Scoto in 1535. On September 19, 1530, in Naples, he completed *De vera vivendi libertate*; on August 6, 1531, in Sessa, he completed *De divitiis*; on September 8, 1531, in Sessa, he completed *De his qui in solitudine apte vivere possunt*; on October 21, 1531, in Sessa, he completed *De sanctitate et prophanitate*; on July 5, 1533, he finished *De misericordia*.

On April 9, 1533, in Sessa, Nifo finished *De sophisticis elenchis* that was printed in Venice by Octaviano Scoto in 1534.

On April 24, 1534, in Salerno, Nifo finished *De re aulica* which was printed in Naples by Giovanni Antonio de Caneto on July 24, 1534.

De re aulica comes within the scope of treatises on the court. Most of this production, however, is of a clearly Platonic mold, as are the other two fundamental texts on this subject, *Il Galateo* by Giovanni Della Casa and *Il cortegiano* by Baldassar Castiglione. In this context, Nifo's *De re aulica* outlines a figure of the courtier that is quite different from the models belonging to the philosophy of the court proposed by Castiglione and Della Casa, based on simple adulation, and the models of a political nature, proposed by Niccolò Machiavelli and Francesco Guicciardini, which were based on private interest. The figure of the courtesan of Nifo is completely original, both because he uses the tools of rhetoric not out of personal interest but to pursue a public good, consisting of the proper political and economic management of the kingdom, and because he applies the Aristotelian criterion of the right means as a guide to his suggestions to the sovereign (Nifo 1534a).

On June 13, 1534, Nifo finished *De generatione animalium* in Salerno. This work was subsequently published together with *De historia animalium* and *De partibus animalium et earum causis*, which have no completion date.

On August 20, 1534, in Sessa, Nifo completed the second edition of *Epitomata rethorica ludicra*.

Nifo's final work is *Topica inventio*, which was finished on August 10, 1535, in Sessa and printed in Venice by Ottaviano Scoto in 1535.

In order to understand the content of this work, it may be useful to remember that, at this time, Italian Aristotelianism was influenced by the growing interest in new scientific methods that were spreading in European universities where the suggestions of Platonic dialectics were accepted and the rhetoric of Cicero and Quintilian had been rediscovered (Nifo 1535b, c. 2r).

Nifo tried to reconcile Aristotelian doctrine and *inventio dialectica* instead of replacing the former with the latter. He was firmly convinced that, on the one hand, the objective of research was to define an order that could not be continually challenged by contingency and, on the other hand, that the cognitive process could not be stopped every time truth could not be learned through the demonstration method (Nifo 1535b, cc. 2r–3r).

Therefore, Nifo's concept of dialectics was not affected by Platonic influences because he did not see dialectics from a metaphysical point of view as the way to access the knowledge of the supreme ideal and intelligible forms; instead, he interpreted it only from a methodological and philological point of view that is therefore mainly useful for research.

Agostino Nifo died in Sessa on January 18, 1538.

At the time of his death, unpublished works remained and would be published later. The first work to be published posthumously was the second edition of *Epitomata rethorica ludicra*, printed in Venice by Ottaviano Scoto in 1538. The second work published posthumously was *De verissimis temporum signis*, printed in Venice by Girolamo Scoto in 1540. The title of the third work published posthumously is *De historia animalium. De partibus animalium et earum causis. De generatione animalium*, printed in Venice by Girolamo Scoto in 1546. The last work to be published posthumously is *De ratione*

medendi, printed in Naples by Mattia Cancer in 1551.

It is useful to remember that, included in the lists of the works of Nifo, two other works have always been mentioned. The title of the first work, whose author is Galeazzo Florimonte, is *I ragionamenti di M. Agostino da Sessa all'illustrissimo S. Principe di Salerno sopra la filosofia morale d'Aristotele*; it was printed in Venice, by Plinio Pietrasanta in 1554 (Bianchi 2016, pp. 43–45). The title of the second work, which is attributed to Gabriel Naudé, is *Augustini Niphi sua tempestate philosophi omnium celeberrimi opuscula moralia et politica. Cum Gabrielis Naudaei de eodem auctore iudicio*; it was printed in Paris by Roletus le Duc in 1645.

Innovative and Original Aspects

Nifo expounds and develops the doctrine of the soul, especially in *De intellectu* and *De anima*.

He also proposes original solutions as in the case of the interpretation of the role of the *cogitativa* (Nifo 1503a, cc. 64r–70r). The *cogitativa* can be considered both a separate faculty and an integral part of the human soul. However, if the second thesis is chosen, it follows that it should be recognized that the soul has more than one form and this leads us outside orthodoxy. Therefore, Nifo proposes the theory of *semi-animae*: the *cogitativa* and the potential intellect constitute two distinct parts of the same soul, two *semi-animae*, which together constitute the only form that is the rational soul, whose task is to give human beings their condition as reasoning animals (Nifo 1522, cc. 159r–v). It follows that a theory that contemplates the possibility of the division of a single form into several parts cannot be considered heterodox with regard to Christianity.

Heritage and Rupture with the Tradition

The controversy between Pomponazzi and Nifo concerning the destiny of the soul continued with the reply that Pomponazzi addressed to Nifo in

his *Defensorium sive responsiones ad ea quae A. Niphus Suessanus adversus ipsum scripsit de immortalitate animae*, completed in Bologna on March 4, 1519, and printed in Bologna by Giustiniano De Ruberia on May 18, 1519. With regard to this reply, it is important to underline the fact that, although he was attacked by many distinguished opponents, Pomponazzi decided to dedicate a paper to defend himself expressly against the arguments of Nifo.

Among all Pomponazzi's publications, this one against Nifo is the only one he produced in response to a single thinker. It can be deduced that Nifo was certainly highly esteemed by Pomponazzi and that his prestige already placed him on a par with the most famous European thinkers of the time.

However, it must also be said, that in his *Defensorium*, Pomponazzi is more concerned with reiterating his theories than with bringing further original contributions to the discussion.

Impact and Legacy

One of the most well-known aspects of Nifo's work is certainly the alleged plagiarism of *Il principe* by Niccolò Machiavelli in the work *De regnandi peritia*, although it is important to point out the fact that Machiavelli's work was printed many years after that of Nifo, in 1532, on January 4 in Rome by Antonio Blado and again on May 8 in Florence by Bernardo Giunta (Machiavelli 1532b).

The two most interesting theories on the enigma of this alleged act of plagiarism were expounded by the nineteenth-century critics Luigi Settembrini and Francesco Fiorentino.

Settembrini suggested that there was no imitation either on the part of Nifo or Machiavelli, but that both were inspired by Isocrat's speeches to Philip of Macedon, through which the author exhorted the sovereign to intervene to bring peace to Greece (Settembrini 1890, II, p. 171).

Fiorentino, on the other hand, states that there is no continuity between the themes previously dealt with by Nifo and those of *De regnandi peritia*, while the subjects dealt with in

Il principe belong to the same genre normally dealt with by Machiavelli, who also adds numerous references to his own personal experiences (Fiorentino 1879).

Abstract

After detailing crucial social realities of the Renaissance elite to provide a basic foundation, this article explores philosophical debates surrounding the concept of nobility. It particularly studies Poggio Bracciolini's *De nobilitate* (c. 1440) and its impact before turning to Baldassar Castiglione's *The Book of the Courtier* of almost a century later. Central to those debates was the question of whether nobility derived from birth, as had been largely accepted in ancient Greece and Rome, or virtue, defined in a variety of ways. By the end of the Renaissance, the concept of birth nobility came to predominate.

Sociocultural Foundations

Great in influence, though small in numbers, ranging from around 1% in parts of western and central Europe to around 10% in places further east, the nobility dominated Renaissance society (for basic overviews, see Dewald 1996; Scott 2007). Arguing they possessed qualities of virtue and leadership to a greater degree than others, nobles held high military, state, and church offices. They controlled vast economic resources. Through their patronage, nobles played a critical role in the development of Renaissance art and culture. In crucial respects, the nobility enjoyed what Dewald has called a truly European history (Dewald 1996, 3). However, the nobility was far

from homogeneous, in part because of the great variety of political entities across Europe, ranging from aristocratic urban republics like Venice to small principalities to large kingdoms like France. In addition, few laws existed to define nobility in precise terms and economic differences also caused distinctions within the nobility. These differences helped inform Renaissance philosophical debates regarding nobility as a social group and as a concept.

Quattrocento Debates and Classical Inheritances

Among other debates, Quattrocento humanists discussed whether to define nobility as a quality primarily acquired through birth and lineage or one primarily acquired through virtues gained from humanist education put into worldly practice (for a useful collection of contemporary texts, see Rabil Jr 1991; for modern scholarly discussions, see Castelnuevo 2009; Finzi 2010). Ancient works, including, for one major example, Aristotle's *Politics* (Aristotle 2013), informed those later Renaissance discussions. Classical texts revealed the widespread ancient, particularly Roman, view that birth provided a defining characteristic of nobility, even if this view was critiqued at times by satirists like Juvenal (1998, 62–70). Although they began earlier, philosophical debates over the concept of nobility in Renaissance Italy intensified over the first half of the fifteenth century, a time leading up to the Peace of Lodi (1454) that witnessed major political transformations, from the self-governing urban communes of the Middle Ages towards the principalities of later years.

A vital trigger for this intensified debate came around 1440 with the appearance of Florentine humanist Poggio Bracciolini's *De nobilitate* (For the text, see Rabil Jr 1991 and for analysis of the work, see Castelnuevo 2009; Finzi 2010). Forty copies of the tract survive, testifying to its impact (Castelnuevo 2009, 2). Bracciolini's treatise takes the form of a dialogue he supposedly hosted

between Florentine man of politics Lorenzo de' Medici, brother of Cosimo de' Medici, and Florentine man of letters Niccolò Niccoli, who functions in the work as a mouthpiece for Bracciolini's own views. Niccolò stresses a stoic sense of absolute virtue as defining nobility (Finzi 2010, 343, 346). Moreover, throughout the treatise, Bracciolini suggests that true nobility is to be found in urban settings, like Florence, rather than in rural areas. He also critiques the concept and practice of ennoblement and the connections between nobility and martial functions and values (Castelnuovo 2009, 6). In making these points, Bracciolini surveyed other models of nobility from across Italy and the rest of Europe, comparing these other models unfavorably to Florence (Castelnuovo 2009, 4–6). He went so far as to refer to the Venetian aristocracy as a *factio* and not a true nobility because of its basis on birth nobility (Finzi 2010, 347). Bracciolini's contentions prompted a vigorous response from other Italian humanists. Notably, Venetian Lauro Quirini composed three treatises refuting Bracciolini (Quirini 1977; Rabil Jr 1991). While not rejecting outright linkages between nobility and virtue, Quirini stressed the role of lineage (Finzi 2010, 354–364).

Castiglione and the Impact of the Courtier

In the following century, Baldassar Castiglione's *The Book of the Courtier* (1528) profoundly shaped European understandings of nobility. The work appeared in the wake of the sack of Rome (1527) as outside powers increasingly dominated Italian affairs. Early on in his work, Castiglione explores nobility through a dialogue between Count Ludovico de Canossa, who defends birth nobility, and Gaspar Pallavicino, who takes the opposite side, less out of conviction than out of a desire to prolong the ongoing discussions about what makes for the perfect courtier (Castiglione 1959, 26–35). Castiglione allows Ludovico to control the discussion. Summing up his arguments, Ludovico declares that “I deem necessary to have [the Courtier] be of noble birth, not only

for many other reasons, but also because of that public opinion which immediately sides with nobility (Castiglione 1959, 31).” This view, which contrasts with Bracciolini's earlier arguments, proved influential as Castiglione's work was reprinted multiple times and translated into a variety of European languages (Burke 1995). Thus, Castiglione's vision formed a crucial basis for European conceptions of nobility moving forward. At the same time, the rural kingdoms of northern Europe, France in particular, also saw shifting understandings of nobility for sociopolitical as well as intellectual reasons. These understandings shifted from medieval understandings of nobility deriving from virtue gained through the profession of arms to a more classical sense of birth nobility by the end of the sixteenth century (Schalk 1986). In short, by the end of the Renaissance, birth and lineage came to define nobility across much of Europe.

Nunes, Pedro

Born: 1502 in Alcácer do Sal, Portugal

Died: 11 August 1578 in Coimbra, Portugal

John O'Connor and Edmund Robertson
University of St. Andrews, St. Andrews, UK

Abstract

Pedro Nunes or Nunez was one of the greatest mathematicians that Portugal has ever produced and one of the most significant scientists of the sixteenth century. He is best known for his contributions to navigation and cartography. He invented the idea of the rhumb line or loxodrome, eventually perfected by Mercator, and developed a method of making more accurate measurements with an astrolabe that eventually led to the Vernier scale.

Biography

Pedro Nunes or Nunez wrote under the Latin name of *Petrus Nonius Salaciensis* (after the Latin name of the city of his birth). Nothing is known of his parents, but they were certainly of the Jewish

religion since he himself was registered as a “new Christian.” Nunes traveled to Spain around 1517 and studied at the University of Salamanca and graduated in 1523.

By 1527 he had returned to Portugal and was employed as a tutor to the brother of King John III. He began teaching moral philosophy at the University of Lisbon and was then appointed to the Chair of Logic before moving to the Chair of Metaphysics in 1532. During this period, however, Nunes was working toward a doctorate in medicine. He was awarded his doctorate in 1523 and gave up public teaching.

Nunes moved to the University of Coimbra to take up the Chair of Mathematics in 1544, a post he held until 1562, although he spent 4 years away from the University living in Lisbon during the period 1557–1561. While at Coimbra, Nunes taught Christopher Clavius, who was the mathematician eventually employed by Pope Gregory to reform the calendar. The Chair of Mathematics was a new post in the University of Coimbra, and it was set up to provide instruction in the technical requirements for navigation, clearly a topic of great importance in Portugal at this period when control of sea trade was the chief source of Portuguese wealth. Nunes had been appointed Royal Cosmographer in 1529 and was promoted to Chief Royal Cosmographer in 1547. He held this post until his death.

The first of Nunes books to be published was *Tratado da Sphera* in 1537 (Nunes 1537). This contains his methods for solving spherical triangles. His next published work was *De Crepusculis* (1542) in which he addressed a problem posed to him by one of his pupils: “Which day has the shortest twilight.” His knowledge of spherical geometry enabled him to solve this without the use of calculus.

In 1546, soon after moving to Coimbra, Nunes published *De erratis Orontii Finaei* (1546b). This book was written to show that Oronce Fine’s attempts to solve the three classical problems of squaring the circle, trisecting an arbitrary angle, and doubling the cube were incorrect.

Nunes work on navigation is what he is best known for. He advocated charts in which lines of latitude and longitude would be represented by

straight lines. Around 1550 he investigated the loxodrome or, to use the name that Nunes coined, the rhumb line. This is the path followed by a ship sailing on a fixed compass bearing. Nunes was one of the first to realize how such a curve differs from a great circle route. In the Mercator projection (invented more than a century later), rhumb lines became straight lines. It was Willebrord Snellius who named Nunes' rhumb line the loxodrome.

He had begun writing his *Libro de Algebra* in 1534 before he went to Coimbra and it was eventually published in 1567. This work deals with, among other subjects, the solution of quadratic and cubic equations, describing the state of knowledge on that subject at the time. In 1571 he put together two of his previously published texts, *De Crepusculis* and *De erratis Orontii Finaei*, bringing them out in a single volume.

Nunes invented a clever method of improving the accuracy of measuring angles in astronomical observations. It consisted of a set of circles drawn on the face of a quadrant or astrolabe and then subdivided so that fractions of a degree could be estimated. This system he called the “*nonius*.” It was later refined and simplified first by Clavius and eventually by Vernier. In some countries, the Vernier scale is still called a *nonius*.

In 1472 Nunes was called to court to preside over the reform of weights and measures. He stayed in Lisbon for two years before finally returning to Coimbra.

Outside mathematics, he worked in geography, physics, and cosmology and he wrote poetry.

Observation in Renaissance Science

Daniele Cozzoli

Pompeu Fabra University, Barcelona, Spain

Abstract

Following the ancient Greek tradition, Renaissance authors subsumed the notion of observation under that of experience. Nonetheless, observation in the Renaissance played a crucial role in the making of modern science, when astronomers and physicians began observing the world systematically. The invention of the printing press, the discovery of the Americas, the introduction of perspective shaped the way Renaissance actors observed the world.

Heritage and Rupture with the Tradition

Observation was not an autonomous philosophical category in Ancient and Medieval philosophy. This fact does not mean, of course, that people did not observe the world, but rather that observation played a different conceptual role in the process of knowledge acquisition and validation. The Greeks incorporated observation under the category of experience. The historians were the firsts who remarked the limits of observation and the problems it raised. Herodotus argued that direct observation was always to be preferred over

indirect observation in the production of historical knowledge (Herodotus 2003). Yet, Thucydides remarked the limits of the *autopsia* stressing that he could not be sure even of what he directly observed and that correct historical explanation was rather matter of interpretation of the events and of the intentions of the actors that were not always explicitly uttered in their speeches (Thucydides 1972, 1, 21; Nenci 1953; Hartog 1988). Plato was rather critical on the possibility of acquiring reliable knowledge even on the human events by means of simple observation. In his *Theaetetus*, he criticized the identification between “seeing” and “knowing,” a distinction that Renaissance authors kept in mind. At the beginning of the dialogue, Euclid asks Terpsion to tell him the conversation between Socrates and Theaetetus he listened to sometime before. Terpsion explains that he wrote down the dialogue after having witnessed it. When he went back home, he started writing it and, whenever he went to Athens, he asked Socrates about what he did not remember. So, the dialogue between Theaetetus and Socrates is a *post hoc* reconstruction, which is moreover going to be read by a slave (Nenci 1953; Canfora 2014; Plato 1997). Aristotle by contrasts relied on observation for the acquisition of knowledge of nature, but he did not put emphasis on it in his theory of knowledge. In his naturalistic and biological writings, indeed, he described several observations, but he also thought over the difficulty of acquiring knowledge by observation. For instance, in his

Historia Animalium, he explained that: “Now, as the nature of blood and the veins have all the appearance of being fundamental, we must discuss their properties first of all, and all the more as some previous writers have treated them very unsatisfactorily. And the cause of the ignorance is the extreme difficulty experienced in the way of observation. For in the dead bodies of animals the nature of the chief veins is undiscoverable, owing to the fact that they in particular collapse at once when the blood leaves them” (Aristotle, *Historia Animalium*, 511b trans. by A. W. Thompson in 1995, pp. 812–813). Nonetheless, Aristotle too focused on the notions of experience and perception, rather than on that of observation (*teresis*) as a philosophical category. In the *Posterior Analytics*, he explained that perception is required for induction (Aristotle, *Posterior Analytics*, 81b trans. by J. Barnes in 1995, pp. 132–133). However, he deemed that induction is a form of justifying knowledge inferior to deduction. Scientific knowledge ought to be organized in a deductive structure showing causal connections from abstract and logically prior principles. It was such philosophical view that prevailed in the *Wirkungsgeschichte* of Aristotelianism and Aristotle’s natural philosophy was rather considered “empiricism without observation” in Renaissance. Galen was concerned with the limits of direct observation too. He extrapolated, indeed, most of his anatomical observations on the human body from dissection on animals, and he thought that observation was fundamental in the process of healing, which, however, also required gaining the patient’s confidence (Nutton 2004).

Innovative and Original Aspects

Consequently, it is not surprising that observation did not play an autonomous role in Renaissance philosophy either and that most of the reflections of historians of early modern science and philosophy deal rather with the notion of experience (see Kuhn 1977; Dear 1995). Renaissance scholars were aware of the reflections on observation in ancient Greek culture. Nonetheless, observation

became a central category of scientific investigation since the Renaissance, mainly due to the work of astronomers and physicians. As astronomical phenomena show a regularity that other natural phenomena do not display, astronomical knowledge has developed in many cultures. It was, however, only in the second half of the sixteenth century, when astronomers started observing the heavens systematically and not only during certain particular astronomical events, such as equinoxes, conjunctions, eclipses, and comets, that observation acquired crucial importance for modern science (Kuhn 1962; Park 2011; Brahe 1913; Regiomontanus 1544). In doing so, they mutated the habits of scholars working on phenomena that did not display the same regularity, such as meteorologists who had to observe natural phenomena systematically, although with lesser predictive success than nonsystematic astronomical observers (Park 2011; Siraisi 2007). By the end of the sixteenth century and the first decades of the following one, some scholars aimed to go beyond the systematic observation of astronomic phenomena and looked for theoretical principles that could drive observation. In his *Mysterium Cosmographicum*, Kepler claimed he wanted to deduce the mathematical pattern of planetary motions a priori, and from the causes. Borelli aimed to study Galileo’s Medicean Stars by means of a theory describing a priori the periodic motion of planets and of their moons under certain data and physical limitations (Koyré 1973; Borelli 1666; Kepler 1981). Terminology in the writings of astronomers started changing too. Renaissance astronomers began using the plural term *observationes*. In 1544, Johannes Schöner published a book, where he summed up observations of a number of astronomers of the previous generations, among which there were Peurbach and Regiomontanus (Pomata 2011; Regiomontanus et al. 1544). By contrast, in classic Latin *observatio* was mostly used in the sense of observance, usually referring to the “respecting or obeying laws or customs,” whereas in the Middle Ages only in few cases it appears to refer to astronomical observation (Pomata 2011).

In the same years when astronomers began observing systematically the heavens, European

anatomists and physicians started observing in detail the human body. Disciplinary boundaries were not strict. The physician relied on astrological consideration for the diagnosis, and many astronomers were also interested in medicine. Physicians began also explaining arguments by referring to cases they have directly observed and not to cases described by classical authors. As stressed by Gianna Pomata, most of the physicians who described their own observations instead of classical examples were practitioners, town doctors, itinerant doctors, or court physicians. Therefore, they were somehow promoting their abilities to their potential customers (Pomata 2011). In his *De humani corporis fabrica*, Vesalius carefully reported and illustrated the results of his observations on the human body carried out by the practice of corpses' dissection, which was prohibited in Galen time (Vesalius 1543). The latter's observations on the human body were mainly extrapolated by dissection of monkeys. Systematic and detailed observation in anatomy was also likely eased by the spread of printed books. Every manuscript was a unique piece often carefully illustrated by an artist, whereas Vesalius' detailed anatomical descriptions required uniformity in all the copies that only a printed book could assure. It is not therefore surprising that authors hitherto preferred relying on observations they found in classic texts, which were familiar to the audience, rather than to cases they had directly observed. Likewise, it was useless to describe animals and plants if the reader could not identify them. In 1530 the first volume of Otto Brunfels' *Herbarum icones ad naturae imitationem effigiatae*, possibly one of the first illustrated florae, came out, and in the following years books describing plants and animals were widely published (Febre and Martin 1958). Nonetheless, observation did not become a category for natural philosophers who were working along the lines of the Greek category of experience. In Goclenius' *Lexicon philosophicum*, published in 1613, there was no entry for observation (Goclenius 1980). But even chemists, alchemists, and natural magicians performing direct observations relied on the category of experience.

Impact and Legacy

It was only in the twentieth century that observation became central in the historical and philosophical analysis of science. Yet, it is worth noting that historians and philosophers of science studied it extensively also by reflecting on the sixteenth- and seventeenth-century Scientific Revolution. Hanson remarked that observation is always theory-laden: how people observe the world depend on their background knowledge, on their prejudices, and on their expectations (Hanson 1958). Hanson drew on Ludwig Wittgenstein's distinction between "seeing" and "seeing how" (Wittgenstein 1991).

Observation in Renaissance, rather than as a philosophical category, can be studied, observation in the Renaissance can be studied by considering how changed the way changed in which different social actors (astronomers, anatomists, naturalists, collectors, artists, craftsmen, merchants, travelers, peasants, etc.) experienced and represented the world. Three elements can be taken into account to analyze *Renaissance* ways of observation. The first element is the encounter between ancient texts and new worlds (Grafton 1995). Analyzing such relationship entails shedding light on how the Europeans adapted their knowledge to the new peoples, places, animals, plants, and objects they found in the Americas. The second is the way in which artists portrayed the world. The third is the evolution of the worldview of lower strata of *Renaissance* society, which constituted the largest part of European societies, but whose written production was scarce. In the last few decades, historians of early modern science and culture have remarked that the cosmos of merchants, travelers, sailors, and astronomers became more similar in the Renaissance. The experience of the merchant and of the scholar somehow molded, when the knowledge of ancient text such as Ptolemy's *Geography* was transmitted through three-dimensional representations in metal globes and translated in the Vernacular (Grafton 1995). Since the seventeenth century metal globes became consumerism object as clocks (De Vries 2008). By contrast, the worldview of the lower strata of European societies was

affected differently by the Age of discoveries and by the invention of the moveable types printing press and servants were unable to elaborate a systematic, coherent system of beliefs: they absorbed various elements and arranged them “within the mosaic of tradition” (Gramsci 1991).

The discovery of the Americas affected the way Europeans observed the world and the way they formed their beliefs from the interaction between their background knowledge and their observations in a number of facets. Firstly, travelers realized that their own personal observations often contradicted their knowledge mostly derived from ancient texts, especially from Aristotle’s work. Secondly, Europeans came face to face with different ways of observing and of deriving knowledge from observation. In his *Historia general y natural de las Indias* Oviedo reported that Antilles natives tried to understand empirically whether the Europeans were mortal by sinking prisoners and observing whether their corpses putrefied, whereas the Europeans sent commissions to investigate whether the Amerindians had souls (Lévi-Strauss 1987; Viveiros de Castro 2014; Oviedo 1535). The discovery of people, plants, animal, and atmospheric phenomena that contradicted the European system of beliefs led the Europeans to revise them adapting their beliefs to what they observed. They adapted their knowledge through translations, popularizations, and material representation. Some of these changes worked in depth in European mentality and affected it above all in the seventeenth century. In his *Apologia pro Galileo* (1622), Tommaso Campanella invited the Catholic Church to revise the Holy Scripture passages concerning the motion of the Earth and that of the Sun arguing that after all the Church accepted to revise those passages concerning the impossibility that the Southern hemisphere could be inhabited after the observation reported by travelers and explorers (Campanella 2001). In a letter to Paolo Foscarini, Cardinal Bellarmine argued that Galileo’s observations could lead to think that we do not properly understand the Scripture, only if Copernicans would be able to provide evidence for their claims. Thus, Bellarmine implicitly stated that observations of travelers in

their reports were of a different kind from that Galileo performed by telescope (Blackwell 1991). The observation of human beings, a definitive closer object than celestial bodies, performed by naked eye, and validated by the collective assent of sailors and travelers, was more certain than the observation performed by few trained scholars by means of an instrument whose reliability could be questioned. In his *Novum Organum*, Francis Bacon described a way of acquiring knowledge centered on the experiment, as a middle term between the reason and the senses. Bacon, however, did not distinguish between experiment and experience, following the Roman and Medieval usage. In the *New Atlantis*, he incorporated both the observation of nature by means of the reproduction of natural phenomena and that of the novelties of the New World into a collective state-ruled system of knowledge production (Bacon 1962–89).

Nonetheless, during Renaissance observation of new people was often explained in terms of familiar observation. The English and the Spaniards often described the “other” they met in the New World by referring to the “other” they had known for centuries, respectively the Moors and the Irish. The English and the Spanish tried to implement the same segregation policy with the American natives that they had adopted with the Irish and the Moors, respectively (Elliott 2006). The incorporation of the observation of novelties found in the New World into the European systems of beliefs was eased by the publication of a number of treatises apt to teach the eye of the traveler to observe (Rubiès 2007). It is worth noting that, in many cases, the authors of these writings had traveled little. Such was the case of Giovanni Battista Ramusio (1485–1557), who undertook a large project of collecting and publishing the writings of travelers and sailors (Rubiès 2007; Ramusio 1550).

Observation of novelties was also organized along the lines of known patterns. The questionnaires sent out by Philip II administration to collect information on the New World, which according to Barrera-Osorio constituted the Spanish empirical way of understanding the world as opposed the Scientific Revolution empiricism

centered on the notion of experiment and inspired by Francis Bacon, were written according to Peter Ramus' *Locii Communes* (Barrera-Osorio 2006; Rubiès 2007).

During the Renaissance, the way in which artists looked at the world evolved too. The painting became the primary object of artistic production. Since the mid-1430s in Italy artists represented the world by means of the geometrical rules of perspectives, whereas in the Netherlands they aimed at representing the world as perceived by their audience (Belting 2010). By the introduction of the mathematical perspective in art, Humanist and Renaissance painters, architects, and engineers transformed the cities and the way their contemporaries saw them. A painting constructed by the rules of perspective is a unitarian organized space. As remarked by Erwin Panofsky, perspective subjected visual perception to geometrical rule, but at the same time it stressed that observation depends on the point of view (Panofsky 1991; Foucault 1966; Arnheim 1974; Gombrich 1960). Although perspective was the work of both humanist intellectuals, painters, engineers, and architects, there was a certain difference in the way a humanist intellectual and a Florentine craftsman observed the world; both were informed observers, but their background knowledge was different. The former was, indeed, aware of Euclid geometry, optics, the subtleties of humanist debates on logic and rhetoric, whereas the latter was the repository of know-how orally transmitted. It is not, therefore, surprising that Leon Battista Alberti's vernacular writings on painting differed substantially from those composed in Latin (Alberti 1991; Baxandall 1977; Grafton 2000).

Renaissance painters mediated their visual experience by means of instruments, such as those built by Dürer. The artist David Hockney and the physicist Charles M. Falco have also argued that realism in Renaissance authors derived from the use of the *camera obscura*, which was described by Leon Battista Alberti in 1437. Their hypothesis, known as the Hockney-Falco thesis, is not grounded in textual evidence, but is inferred from the observation of some Renaissance paintings (Hockney 2006; Dupré 2005; Schechner 2005).

The lower strata of European society observed the world in a nonsystematic way by definition. Nonetheless, it also evolved during the Renaissance, mainly as a consequence of the age of discoveries and of the invention of the printing press. While the elites could spread their ideas thanks to the printing press and, therefore, their observations, the way the subaltern observed the world was shaped by elements from the popular books they read (and by the illustrations they found in them), among which are the tales of travelers. Della Porta, Bruno, Campanella incorporated their observations into natural magic, while Menocchio and the Benandanti incorporated them into a magical worldview shaped by their readings (De Martino 2013; Ginzburg 1976, 1983; Rossi 2007).

Occult Properties in the Renaissance

Laura Sumrall

History and Philosophy of Science, University of Sydney, Sydney, Australia

Abstract

In Renaissance natural philosophy, occult properties – from the Latin *occultus* meaning “hidden” – referred to properties producing manifest effects such as magnetism and heliotropism that could not be causally linked to normal elemental mixture and their manifest qualities (such as the primary dichotomies of hot, cold, wet, and dry). Often termed “occult qualities” or “occult virtues,” occult properties were typically considered natural but acting in a manner that could not be empirically understood. Because occult properties existed beyond sensory perception, they were likewise considered potentially beyond intellectual comprehension, which ensured their central position in epistemological debates throughout the Renaissance.

Synonyms

Occult qualities; Occult virtues

Heritage and Rupture with Tradition

Following the works of Thomas Aquinas (ca. 1225–1274), occult properties were

accommodated within the Aristotelian context as products of an object’s substantial or specific form. In this interpretation, occult properties in individuals of a certain species could arise from the formal influence of celestial motion on natural generation. Attributing the effects of occult properties to form rather than matter likewise accounted for the characteristically disproportionate efficacy of occult action, owing to the higher potency of form (Aquinas 1976; Copenhaver 1984; Eamon 1994).

The potency of occult properties also ensured this category’s significance for natural magic, which sought to identify and manipulate them to powerful effect. In this context, occult properties indicated a formal reality beyond sensory experience that usually required epistemological approaches remote from traditional reason. For instance, in his famed *De occulta philosophia* (1533), Heinrich Cornelius Agrippa (1486–1535) emphasized divine knowledge against the unreliability of sensory experience. Agrippa’s natural philosophy and others like it also attempted to compensate for the inherent epistemological difficulties of occult properties by utilizing theories of symbolic correspondence, such as the microcosm-macrocosm analogy (Agrippa 1992; Copenhaver 1984; Daston and Park 1998; Henry 2008).

In general, the epistemic status of occult properties hinged on whether or not the insensible was likewise unintelligible. Once it was granted that such properties were causally obscured but not unintelligible, various epistemological stances could be taken. Philosophers in the Aristotelian tradition, such as Pietro Pomponazzi (1462–1525), would attempt to provide a reasoned, causal explanation of occult properties in order to bring them into scientific discourse. However, alternate epistemological approaches increasingly focused instead on understanding occult properties through their manifest effects. In this vein, the chymical physician Daniel Sennert (1572–1637) emphasized the potential to understand occult properties through investigation into the material in which they resided. Likewise, it was these manifest effects that Francis Bacon (1561–1626) would place at the foundation of his inductive approach (Rossi

1968; Hutchison 1982; Millen 1985; Eamon 1994; Newman 2006).

Impact and Legacy

In the seventeenth century, the mechanical philosophy – especially in its Cartesian form – recast occult properties as a temporary manifestation of human ignorance stemming from the inadequacies of the senses, rather than accepting them as unintelligible by their very nature. This skeptical attitude toward the epistemic power of the senses rendered all qualities fundamentally occult but likewise equally capable of being rendered manifest. In this context, the category of occult properties met with increasing derision from natural philosophers who considered them to be at best a passive excuse for ignorance. Even within works on natural philosophy that firmly adopted a magical perspective, occult properties became a target for investigative effort that emphasized clarification (Hutchison 1982; Millen 1985; Henry 1986; Copenhaver 1998).

In the late seventeenth century, the negative status of occult properties as a category would not prevent their persisting epistemological influence. Following the publication of his *Principia*, Isaac Newton (1643–1727) fell under criticism for what the Cartesians identified as the workings of occult properties in his theory of gravitation. While Newton deliberately distanced himself from the implications of the term “occult,” his willingness to eschew a causal explanation of gravitation in favor of focusing on its manifest effects reveals the creative potential of this long-standing category and its heuristic utility for scientific knowledge (McGuire and Rattansi 1966; Hutchison 1982; Henry 1986; Copenhaver 1998; Henry 2008).

Abstract

Defined as “the Savonarola of the 16th century” (Bainton 1940) and as “one of the fathers of scepticism” (Gotor 2013), Bernardino Ochino is undoubtedly one of the most representative historical figures of the Italian history of the reformation due to his charming and fascinating preaching, as well as his doctrines concerning the sacraments, predestination, and salvation. Banished since 1542, Ochino was forced to move across Europe for the rest of his life because of the radicality of his ideas (Benrath 1892). Many important studies have been devoted to Ochino, and Pierre Bayle (1647–1706) also dedicated one article of his *Dictionnaire Historique et Critique* to the Senese preacher.

Life and Works

Bernardino Tommasini “Ochino” was born in Siena in 1487. On the origins of his name, different

hypotheses have been formulated: for some, such as Aonio Paleario, the nickname “Ochino” depends on the physical features of Bernardino, such as his beauty or tiny sharp eyes; others thought that “Ochino” could refer to the *contrada* of the city of Siena where he was born (*contrada dell’Oca*) or simply be a family name. We have little information about his childhood but know quite a lot about him after 1503/1504, when Ochino took the Franciscan habit in the famous Senese convent of “la Capriola”: it was built on the ruins of Bernardino da Siena’s shelter, thanks to the interest of Pandolfo Petrucci (1452–1512). Ochino spent a few years in Perugia, where he studied medicine and may have known Giulio de’ Medici, the future Pope Clement VII (1478–1534).

Ochino, a Capuchin Friar

Between the end of the 1520s and the 1530s, Ochino entered the newborn order “della vita heremitica” friars of Saint Francis, the so-called Capuchins, due to the shape of the habit worn by Matteo Bascio (1495–1552) (Gotor 2008), one of the founders of the new order: on 3 July 1528, with the bull *Religionis zelus*, Pope Clement VII formally approved the new congregation, oriented to a stricter rule, compared to the Franciscan rule. Matteo, elected in 1529 general vicar of the Capuchins, decided to leave the new congregation and return to the Observant Franciscan. Ludovico of Fossombrone (1490–post 1555) followed Bascio in the new congregation, but he had difficulties handling the new shape that the order was assuming. There was a real exodus of Observant friars and, for this reason, the Franciscan asked the Pope to banish the new Franciscan family, between 1529 and 1534 (Gotor 2005).

With the protection of the Pope and support of influential personalities such as Caterina Cybo (1501–1557), the new order continued to evolve and expand: also Ochino, during these years, entered the *Cappuccini*, wishing – like many others – to distance himself from the internal fighting that affected the *Franciscan observant* congregation. The entrance of Franciscan observant theologians and preachers among the

Capuchins gave to the new order a particular shape, with the focus mainly on study and preaching: Ochino was the most important exponent of this new trend, and in 1535, he requested and obtained the summon of the general chapter of the order, with the support of Vittoria Colonna (1490–1547) and Pope Paul III Farnese (1534–1549). This move placed him in sharp contrast with Ludovico of Fossombrone who, shortly afterward, left the order (Camaioni 2015; Busolini 2006). The chapter of Saint Eufemia was held in 1536 and ratified the success of Ochino's side. In 1538, he was elected general vicar of the Capuchins and so for Ochino began a period of intense preaching activity all over the Italian peninsula: his sermons had elements drawn from the Franciscan and Bonaventurian context, especially with regard to the condemnation of vice, sin, and luxury. Between 1538 and 1542, he visited Rome, Florence, Perugia, Bologna, Milan, Venice, and Naples, among other places (Camaioni 2009; Gotor 2013): in Naples in 1536, when Ochino arrived for the first time, the Theatines – the religious order founded by Gian Pietro Carafa (1476–1559) and Gaetano di Tiene (1480–1547) in 1524 – were already active and criticized Ochino's approach to religion. From 1535, Juan de Valdès (1509–1541) visited Naples and Ochino was strongly influenced by his spirituality, characterized by charity and the mystical experience of the presence of God inside the human soul: Ochino joined the circle, later called the “spirituali” around Valdès, as is clearly understandable from the works *Dialoghi quattro* (Ochino 1540) and *Dialoghi sette* (Ochino 1985). He deepened his relationship with the cardinals Gasparo Contarini and Reginald Pole; in 1541, in Venice, he published his *Prediche nove* including a series of sermons held in Lucca (Ochino 1541). As early in Naples, in Venice, the Theatines attempted on several occasions to obstruct Ochino's preaching, who enjoyed the protection of Pope Paul III and the cardinals (Fagnito 1972), at least for a time: in 1542, while in Verona, Ochino was invited to Rome by Cardinal Alessandro Farnese. From this moment, his situation changed irrevocably: Pietro Martire Vermigli (1499–1562) received a communication

too, and in Rome, six new cardinals were designated for the newborn “Santo Uffizio.” Ochino received a second letter, this time containing a peremptory summons, and for the two theologians, it was clear that, in the Roman Curia, the balance had definitely changed: the harmonization of reformist tendencies with the Catholic tradition was now no longer an option. During his trip to Rome, Ochino visited Bologna to attend the sickbed of Cardinal Contarini, and shortly afterward, in Florence, he met Vermigli who convinced him to flee from Italy (Solmi 1908; Fagnito 1972).

The Escape of 1542 and the Exile

Ochino decided to run away to Switzerland: both during his escape and afterward, when he was safely in Geneva, Bernardino wrote several letters to his Italian friends to explain the reasons why he left (Ochino 1985). He wrote to Vittoria Colonna on 22 August 1542, clearly stating his intention to avoid the tribunal of the Inquisition. With regret, Ochino describes how much he misses Vittoria and Reginald Pole's advice. The marquise did not write back to Bernardino and instead showed the letter to the inquisitor Matteo Cervini, the future Pope Marcello II (1501–1555) (Fagnito 1972). The protectors of Ochino, intellectuals, nobles, and exponents of the Roman Curia, felt threatened by his escape and by the letters he kept sending them, because this correspondence represented evidence of their personal connection with Ochino. During this Swiss period, the preacher engaged in theological disputes with Ambrogio Catarino Politi and Girolamo Papini (Prosperi 2003), among others, and published many of his works: in 1542, in Geneva, the *Imagine de Antechristo* (Ochino 1542a) and a collection of 20 *Prediche* (Ochino 1542b), sermons in which the author melded Calvinism, Valdesian spirituality, and Joachimitic millenarism, and, in 1545, the *Sermones* and the *Expositione sopra la epistola di san Paulo alli Romani*, all included on the List of Prohibited Books. In Geneva, the integration of Ochino into the local community of Calvinists was dissatisfactory, but he managed to

have a family by marrying an Italian woman in exile from Lucca (Tuscany), where Ochino had preached a few years before, who bore him several children. Still, in 1545, Ochino visited Basel and Augusta and published the *Espositione sopra la epistola di san Paulo alli Galati* and the *Risposta alle false calumnie et impie biastemie di frate Ambrosio Catharino* (Ochino 1546; Firpo 2001). After the defeat of the Schmalkaldic League by Emperor Charles V, who *had listened to Ochino's sermons several years before in Naples*, Ochino was compelled to move – again – and went to Strasbourg.

Ochino and Vermigli in England

In Strasbourg, Ochino met Pietro Martire Vermigli, but they both left the city because of the harsh conditions imposed by the emperor on religious life, and went to England, responding to the invitation of *Thomas Cranmer*, Archbishop of Canterbury: they touched English soil on the night of 20 December 1547 (Overell 2008). Preceded by his reputation as a major preacher, Ochino soon became the core of the Italian community in London, with a salary and a vicarage. Princess Elisabeth, the future Queen Elisabeth I, had a special interest in Bernardino's theological production, and she translated from Italian into Latin his *Sermo di Christo* (Gabrieli 1983). In 1549, Ochino published two works: the *Dialogus de regis et populi* and the *Tragoedia or dialogue of the iniuste usurped primacie of the Bishop of Rome* (Ochino 1549), a controversial text, translated into English – and published only in English – by John Ponet. The *Tragoedia* consists of nine dialogues between 18 speakers, including Lucifer and Beelzebub, who are the main characters of dialogues I and VI. This work was entirely conceived and written in London, with characters and a context of English inspiration: no clue remained of the original manuscript of the *Tragoedia*, which was supposedly in Italian rather than Latin as stated on the frontispiece of the *editio princeps*. Among the sources of the *Tragoedia*, scholars have easily recognized the *Tragoedia nova Pammachius*, written by Thomas

Kirchenmeier called Naogergus (1508–1563): the work also had a Polish version, which was considerably modified (McNair 1991). Later, in 1555, with the restoration of the Catholic Maria Tudor, Ochino's books were prohibited in England (McNair 1991), but their memory remained alive, as the first book of *Paradise Lost* by John Milton proves: Milton was probably inspired by the *Dialogus de polygamia* of Bernardino, especially in outlining the character of Beelzebub.

The other English work of Ochino, the *Dialogus de regi et populi*, was translated into English from Latin in 1657 by an anonymous translator defined as “a person of quality” in the frontispiece; Ochino remained in England until 1553, when he returned to Switzerland, passing through Strasbourg where he left his family.

The Works of the Last Decades Between Geneva and Austerlitz

In Switzerland, Ochino found the situation more complex than had been the case in 1547 when he left: in Geneva, he watched Michel Servet being burned at the stake and, before leaving for Chiavenna and Basel, managed to publish a work that remains one of the most interesting of his writings, the *Apologi* (Ochino 2012): by means of sketches and brief tales, Ochino mocks clerics, bishops, and the ecclesiastical environment, roughly criticizing the Petrine primacy and the papal authority, a critique that culminates in the figure of the Pope Antichrist (Pierno 2007).

In 1556, Ochino published more works in Zurich, where he was shepherd of the Italian community of refugees: the *Dialogo del purgatorio* and the *Syncerae et verae doctrinae de Coena Domini expositio*, concernig the dispute between Zwingli and the Lutherans on the Eucharist and, in 1561 in Basel, the *Disputa intorno alla presenza del corpo di Giesù Christo nel Sacramento della cena*, the *Catechismo o Institutione Christiana*, and the *Laberinti del libero arbitrio* (Ochino 2004). Printed in Basel and translated into Latin by Sebastiano Castellione (1515–1563), the sermons of the *Laberinti* show a strong influence of spiritualism and several contemporary authors.

They are 19 sermons, 16 of which can be matched, since to every “labyrinth” or problem in the first part (sermons 1–8) corresponds a solution in the second part of the work (sermons 9–18). Eight questions on free will and enslaved will (*de libero arbitrio, de servo arbitrio*) have corresponding solutions, but these solutions are often labyrinths and the last sermon (19) expresses plainly the Ochinian concept of salvation, followed by all the doubts that make it difficult to find a genuine solution. Such a skeptical vision does not question the moral obligation to lead a right and decent life. The *Laberinti*, strongly influenced by the *De fato* of Pietro Pomponazzi, shows the impossibility of finding a simple solution to the free will question and leads the way to a skeptical attitude toward the theological discussion that, through Valla, Giovanfrancesco Pico and Lelio Sozzini will find its climax in the *Ars dubitandi et confidendi* of Castellione (Ochino 2004; Bracali 2000; Cantimori 1929).

The religious authority of Zurich could not tolerate the position expressed by Ochino, which contrasted with the doctrine of absolute predestination of the protestants (Taplin 2003); with the publication of the *Dialogi XXX* by Ochino in 1563, the situation collapsed and he fled. Because of certain statements in the *Dialogi*, Bernardino was accused of defending polygamy but also his claim against the execution of Michel Servet and the Anabaptists in Zurich, the discussion on tolerance, on the freedom of thought and religion, which came from the valdesian and franciscan root of the primacy of interior inspiration. Basically, the impossibility of reducing Ochino to a defined and unique religious and theological context made him what we may refer to as a free-thinker (Gotor 2013; Firpo 2001).

Banished from Zurich, Ochino went to Basel and Nuremberg, where he published the *Dialogo autoapologetico*, a self-defensive treatise in which he discussed the accusations issued against him. After other transfers – some of his children died from the plague during the travels – Ochino arrived in Austerlitz, and here he died between the end of 1564 and the beginning of 1565, leaving behind a veil of mystery about the circumstances of his death: a few years later, Marcantonio

Varotta, an Italian Calvinist who took refuge in Austerlitz, affirmed that Ochino burned to death while sleeping lying on a stove.

The Relationship with the “Spirituali” Between Valdès and Pole

The relationship with Valdès and his influence on Ochino started in Naples in 1536 (Firpo 2015). As Delio Cantimori (Cantimori 1929, 1939) has already noticed, several representatives of the Italian spiritualism shared a common thought about the possibility of integrating the reformation and continuity with Catholicism (Firpo 2001; Gotor 2013; Camaioni 2015). It is certain that Ochino had in mind the *Alfabeto cristiano* of Valdès during his preaching of the 30s, even if later he referred to Valdès’ preaching as “predicar Christo mascarato in gergo,” i.e., cautious and careful preaching, rhetorically structured to be persuasive and to hide strong theological positions. Later, in 1542, with the death of Cardinal Contarini, the hopes of a resolution between the need for reformation and the Catholic tradition also died.

With the papal bull *Licet ab initio* and the constitution of the Inquisition, Cardinal Carafa obtained permission from Pope Paul III to carry out a policy of repression of the unconventional doctrines, with the help of the control measures of the Theatines. Ochino and Vermigli were among the first targets: Contarini stressed the possibility of a peaceful settlement and protected Ochino until his death. He wrote a letter to Bishop Matteo Giberti in which he stated that Contarini, on his deathbed, warned him about the Roman summons in 1542; Giberti himself waited a few days before telling Cardinal Carafa of Ochino’s escape, so that he could reach safety in Switzerland.

The relationship between Ochino and Contarini is described in the sermons published in 1542 in Geneva, where everything hinges around the Bolognese meeting at Contarini’s house. The *Spirituali*, members of the so-called *Ecclesia Viterbiensis* of Reginald Pole, did not suffer any consequences due to Ochino’s escape but, in the

following years, something changed. Pietro Carnesecchi, for example, during summer 1546, had to face a trial that fortunately ended well, thanks to the intervention of Cardinal Reginald Pole and Paolo Farnese. Others, such as Vittoria Colonna – who was very close to Ochino both intellectually (Bardazzi 2001) and by giving him material support – distanced themselves from the preacher and changed their orientation. Undoubtedly, the pope did not spare any effort to protect the Viterbese group, composed of many relevant personalities – also ecclesiastical – whom he had supported in the previous years (Fragnito 1972).

Preaching and Social Reforms

Ochino began his activity as a preacher in the 1530s and visited many Italian cities: some stops on his itinerary were particularly important to him, such as Naples. Here, the theme of predestination arises in his sermons, especially between 1539 and 1540 (Gotor 2013). During this time, the doctrine of the justification by faith was not officially condemned (until 1547), but the preaching of Ochino was enough for the Theatins to doubt deeply his thought's orthodoxy. In Venice, where he went for the first time in 1539, the Venetian branch of the Theatins attacked Ochino, questioning the rightness of his religious beliefs, but he continued to preach and defend himself from the pulpit, inspiring immense passion among his followers (Bainton 1951). In Perugia, his sermons focused on the condemnation of the iniquity and tyrannical impositions of the rulers, a preaching characterized by apocalyptic and evangelical tones, that influenced the political balance of the city and caused the reaction of Perusian people against Paul III Farnese, the so-called "Salt War" (1540), because of the salt tax imposed by Pope Farnese (da Campagnola 1993). After all, as shown by Camaioni (2013), the *Constitutions* of the Capuchin order of 1536 envisaged a close cooperation between the friars and the civil and religious authorities, often expressed in charities and, sometimes, in social and political reactions. During his regency of the Capuchin Order, Ochino promoted

several charity initiatives, in line with the Observant Franciscan tradition, also in order to place his preaching in line with Bernardino da Siena and Girolamo Savonarola's actions. In 1535, Ochino convinced Pope Paul III to create a shelter for unmarried women in Rome; in Perugia and Bologna, Ochino established and promoted the foundation of charities for orphans and women; in Ferrara, with the help of Vittoria Colonna, he founded a convent of the Order of Saint Claire; in Mantua, Lucca, and Venice, he preached in favour of hospitals and assistance for the poor. In 1540, Ochino organized in Siena the liturgy of the Forty Hours' Devotion or *Quarantore* (devotional exercise of continuous prayer that celebrates the time between death resurrection of Jesus Christ), linking it to the citizens' service at the hospital of Santa Maria della Scala (Gotor 2013).

The complete list of Ochino's works is given in Benrath (1874), Nicolini (1939), and Tedeschi et al. (2000).

Ockhamism

Thomas Jeschke

Faculty of Arts and Humanities, Thomas-Institut,
University of Cologne, Cologne, Germany

Abstract

“Ockhamism” is a concept used to label positions or persons who adopt or are said to adopt the teachings of William of Ockham at Oxford. In contrast to earlier scholarship, recent studies have modified both the view of Ockhamism as a single and monolithic school and the assumption that Ockhamism was one of the strongest currents in later medieval philosophy. Historically, Ockhamism has often been identified with nominalism. Yet, current scholarship attempts to distinguish between Ockham's own positions, Ockhamist teachings (that is, later adaptations of Ockham's positions), and genuine nominalist approaches (Beckmann 2010, p. 172). One means of doing this is to differentiate between the extrinsic and the intrinsic perspective. The extrinsic perspective regards theologians or philosophers as Ockhamists when others have described them as such,

while the intrinsic perspective, mostly favored nowadays, starts with the self-assessment of theologians and philosophers, considering whether they understood themselves to be followers of Ockham or not. In the past, scholars first and foremost started with Ockham's own positions and looked for philosophers and theologians who held the same positions, labeling them Ockhamists. This approach does not, however, reflect the rather loose concept of school traditions in the late Middle Ages, especially in the Ockhamist tradition. Even Ockham's most prominent disciples, Adam Wodeham and Robert Holcot, were influenced by his teachings without, however, following him in all doctrinal matters.

Heritage and Rupture with the Tradition

"Ockhamism" as a concept goes back to the nineteenth century (Hallam 1837, p. 256; Werner 1859, p. 125; Prantl 1870, p. 2). As early as 1339–1341, however, the statutes and acts of the faculty of arts at the University of Paris referred to *doctrina/scientia Okannica*, the *errores Ockanici*, and *Occhanistae* (Hübener and Schepers 1984).

Parisian Scotists (followers of John Duns Scotus) in the late fourteenth century characterized Ockhamists as ungainly (*rudes*) and as terminists (*terministae*). The edict that King Louis XI issued against tendencies at the University of Paris in 1474 established the label "nominales." In contrast, however, to what Ritter (1921) and Ehrle (1925) have assumed, the names listed in the edict were not described as "nominalists," but rather as "renovating doctors" who figured as inspirational sources for later nominalists and terminists; Ockham was listed among these doctors, along with John Buridan, Marsilius of Inghen, Albert of Saxony, and John Dorp (Gilbert 1974; Courtenay 1995). The nominalists who were attacked, in defending themselves against the charges in the edict, accepted Ockham as their master but refused to make his teaching the basis of their own. Later, Antonio Coronel, a pupil of John Major and a teacher of John Calvin (Coronel 1528, f. 40r), confirmed this disjunction

by stating that nominalists do not follow Ockham but only the truth.

This should provide an indication that the concept of Ockhamism ("*secta Occanica*," etc.) was less a school in the strict sense (as, to a great extent, Thomism was) than a label for a new movement in philosophy and theology, or even for a new scientific culture (Bottin 1982, pp. 17–18). In the fifteenth-century *Wegestreit* (conflict between the *viae*), this movement was called *via nominalium*, and it was opposed to the realist way of doing philosophy and theology, which was associated with the names of Albert the Great, Thomas Aquinas, and John Duns Scotus.

This new way (*via moderna*) brought together several features, which went back to Ockham and developed his views further. These features all stood in strong opposition to the old way (*via antiqua*) of the *reales* (Bottin 1982, pp. 24–25): (1) it allowed for divine interference *ex potentia Dei*; (2) it gave preference to the cognition of the singular (intuitive cognition); (3) scientific problems were not treated metaphysically but logically and analytically; (4) it established a linguistic theory (of supposition); (5) simpler explanations were preferred ("Ockham's razor"). These positions, however, were often misunderstood in the following centuries. Contemporaries wrongly accused Ockhamists of denying theology as a science or of making science as such impossible. Misinterpretations with regard to the *potentia Dei* circulated in Lutheran environments. "Ockham's razor" was summarized as "entities are not to be multiplied," which was not the formulation of Ockham himself. All this shows that Ockham was used as a proxy for nominalist or "new" positions (Beckmann 2010).

Innovative and Original Aspects/Impact and Legacy

In early twentieth-century scholarship, there was an overemphasis on Ockhamism in Ritter and others. When these historians of philosophy began to study Ockham, they tended to credit him with far more influence than he ever had, especially

in assuming the existence of an influential Ockhamist school (Roest 2000, pp. 176–177; see Ritter 1921, 1922, 1926–1927). In this vein of modern scholarship, Ockhamism and with it nominalism, terminism, and the *via moderna* (which were often identified with each other) were portrayed as an innovative and trendsetting development, while other currents (Thomism, Scotism) represented the decline of late medieval philosophy and theology. More recent scholarship (at least since Oberman 1963) has tried to correct this exaggerated perception of the influence of Ockhamism.

Earlier scholarship also used an extrinsic perspective to identify Ockhamists: after establishing criteria for Ockhamism, they skimmed through the decades looking for theologians and philosophers who fit those criteria. Historians of medieval philosophy now adopt an intrinsic perspective, looking instead for theologians and philosophers who regarded themselves as Ockhamists or followers of Ockham. An interesting test case of this strategy is Gabriel Biel, who “proves to be a true disciple of Occam, and a faithful preserver of the impressively coherent structure of the Occamistic system” (Oberman 1963, p. 424). Starting from Biel, one gets a different picture of Ockhamism. Moreover, the intrinsic perspective is apt to identify “Ockhamisms” rather than one single and monolithic Ockhamism, assumed in older scholarship. Thus, Courtenay (1995, p. 270) believes that there is no “continuous stream that we can call Ockhamism from 1330 to 1530,” but instead different implementations of Ockham’s thought. In northern Italy, there was a lack of Ockhamists, since universities there had no faculties of theology but only colleges, that is, organizational bodies for doctoral students (Monfasani 1993). Since Ockham’s influence was especially strong in theology, his ideas were most likely to be found among “secular masters of theology in northern universities” (Monfasani 1993, p. 257), such as Peter of Ailly, Marsilius of Inghen, and Albert of Saxony, as well as among German Augustinian Friars such as Luther, John Nethin, and Bartholomew Arnoldi of Usingen. This, however, does not mean that Ockhamist positions were absent outside an institutional setting in places such as

northern Italy. Moreover, as Beckmann (1998) points out, Ockhamism needs to be distinguished from Ockham’s thought or “system.”

Ockhamists, that is, philosophers and theologians strongly influenced by Ockham’s positions, include

Adam Wodeham (disciple), Robert Holcot (disciple), Nicholas of Autrecourt, John of Mirecourt, Gregory of Rimini, John Buridan, Albert of Saxony, Peter of Ailly, Gabriel Biel, Walter Chatton, and William Crathorn (Beckmann 2001, col. 1190).

Abstract

Fernão de Oliveira (1507– c. 1581) was a Portuguese humanist and cleric, best known for being the author of the first grammar of Portuguese language. He was also a distinguished nautical engineer, naval warfare theoretician and pilot, as well as historian and translator.

Biography

Born in Aveiro, Portugal, in 1507, Fernão de Oliveira started his studies at the Dominican Convent of his hometown, having later transferred to the Dominican Convent of Évora, Portugal, in 1520. There, he is said to have studied under the humanist André de Resende. He left this convent for Spain around 1532: there, he became a secular clergyman, developed an interest in shipbuilding,

and devoted his time to the study of Spanish language, namely through Antonio de Nebrija's *Grammatica de la lengua Española* (1492), a Portuguese translation of which he left incomplete in manuscript form (c. 1579–80c). Oliveira returned to Portugal around 1536, the year in which his descriptive grammar of Portuguese language for a modern critical edition, see (*Gramática da Linguagem Portuguesa*, 2012) was published in Lisbon – this remains his most famous work.

Around 1541, Oliveira left the country bound for Genoa, for unknown reasons, although some historians sustain that he was involved in the secret negotiations concerning the New Christian community involving the Portuguese king, John III, and the Holy See. In 1543, upon his return to Portugal, Oliveira was denounced to the Inquisition and fled to France, having set aside his religious life, and embraced the military life. He served France in the war against England, having enlisted in the navy, under the command of the Baron Saint Blancard in 1545. His ship having been taken by the English, Oliveira acted as an intermediary in the negotiations for the liberation of the crew in London, and he became known at court, namely by Henry VIII: his successor, Edward VI, entrusted him with a letter to King John III. Oliveira spent approximately a year at the English court, and upon returning to Portugal in March 1547, he once again attracted the attention of the Inquisition, having openly commended Henry VIII for his heretic sympathies - he spent 3 years imprisoned, until the brother of the King of Portugal and Inquisitor, Cardinal Henry, granted him freedom (on condition of not leaving the country without his permission, given that Oliveira had once fled the country). In 1552, he embarked on a mission to Morocco as chaplain to the Portuguese fleet that was sent to aid the King of Velez, allied to the King of Portugal, and he was taken hostage by the Ottoman Turks. Upon his return to Portugal, he was appointed typographical proofreader at the printing house of the University of Coimbra, where he also taught courses on Quintilian.

In 1555, the oldest treatise on maritime strategy was completed by Oliveira: his *Arte da*

guerra do mar was published in Coimbra (critically edited in 2008). This book, made up of two parts of 15 chapters each is broad in scope and engages with issues such as theories of just war and strategy, logistics and shipbuilding, and intelligence. It is likely that it was some of Oliveira's outspoken views on the transatlantic slave trade and the unjust wars expressed in this work that landed him in trouble with the Inquisition once again. He was imprisoned between 1555 and 1557, after which he left Portugal, most likely for France, where he devoted the rest of his life to composing a varied range of works, some of which were left in manuscript form: his *Ars Nautica* (c. 1579–1580d), an encyclopaedic work in Latin, which applied practical science to shipbuilding and navigation comprises three parts: on navigation, cartography, and meteorology (Part One); naval construction (Part Two); and naval logistics (Part Three). The techniques and science of ship building was explored in detail in another work left in manuscript form, the *Livro da Fábrica das Naus* (finished c. 1580, available in the 1898 [1991] edition by Lopes de Mendonça).

Before his death (probably in 1581), Oliveira was very involved with the political life of Portugal, which had been annexed by the Spanish Crown in 1580, under Phillip II: Oliveira left us two historiographical works in manuscript form, both destined to demonstrate that Portugal had long been an independent nation from Spain: *Liuro da Antiguidade, Nobreza, Liberdade e Imunidade do Reino de Portugal* [Book of the Antiquity, Nobility, Liberty and Immunity of the Kingdom of Portugal] (c. 1579–1580a) and *Historia de Portugal* (incomplete, c. 1579–1580b, critically edited in 2006).

Omnia in Omnibus

Abstract

Omnia in omnibus (“everything in everything” or “all in all”) is a Neoplatonic principle used to indicate that all things are in all things, but in each thing according to its proper nature. Renaissance philosophers invoke the principle to express the idea that everything – be it an intelligible Form, a sensible object, or an ontological level of reality – represents the totality of things in its own proper way. In Antiquity, the principle was anticipated by Anaxagoras and Plotinus, before being fully developed and canonized in the writings of Porphyry

(*Sent.* 10) and Proclus (*Elements of Theology*, prop. 103). Via Proclus, it found its way to the works of pseudo-Dionysius the Areopagite, although, here as elsewhere, the theological meaning of 1 *Corinthians* 15:28 (*ut Deus sit omnia in omnibus*) should be taken into account as well. In the fifteenth century, Nicolaus Cusanus adopts the principle in his doctrine of *quodlibet in quolibet*, which states that each thing is a contraction of the entire universe. The notion occupies a central place in Marsilio Ficino's commentary on the *Timaeus*, where it is applied to the multilayered existence of the four elements. Giovanni Pico della Mirandola restates the principle in his *Conclusiones secundum Proclum* and gives it a key role in his biblical hermeneutics. Finally, Giordano Bruno integrates the various meanings of *omnia in omnibus* into a comprehensive view of the cosmos as simultaneously one and many.

Heritage and Rupture with Tradition

As we learn from Aristotle (*Phys.* III, 4, 203a19 ff. and I, 4, 187a20 ff.), the idea that everything is in everything is already found in the natural philosophy of Anaxagoras. In this context, the maxim πάντα ἐν πᾶσιν refers to the omnipresence of the material ingredients of the cosmos (e.g., bone, flesh, wet, dry, hot, cold, etc.). According to Anaxagoras, everything is a mixture of all the basic constituents of reality.

The application of the principle to the realm of intelligible objects is ascribed by Syrianus (*In metaph.* 82, 1) to the Pythagoreans, and by Iamblichus (*ap. Stobaeus Ecl.* I. xlix. 31) to Numenius in particular (Dodds 1964: 254). This “metaphysical” interpretation is further developed in the Neoplatonic tradition. Plotinus, for example, explicitly rejects Anaxagoras' materialistic interpretation of the principle (*Enn.* II.4.7) and instead applies it to the intelligible world (*Enn.* V.8.4). For Plotinus, the Intellect is simultaneously one and many: it is the one undivided whole of the many Forms. In the Intellect, each form is identical with both itself

and the Intellect, and, as a result, with all other forms. In the Intellect, all intelligibles are everywhere “for light is transparent to light” (*Enn.* V.8.4).

The formula *everything in everything* is canonized by Plotinus' student Porphyry. Starting from the writings of his master, he arrives at an original and full-fledged thesis (D'Ancona 2005: 189): “everything is in everything, but in a way that is appropriate to the essence of each thing” (*Sent.* 10). According to Porphyry, all things are in the Intellect intellectually (νοερώς); in the soul rationally (νοερώς); in plants in the manner of seeds (σπερματικῶς); in bodies in the manner of images (εἰδωλικῶς); and in the First Principle super-intellectually and super-essentially (ἀνεγνωτός τε καὶ ὑπερουσίως).

This Neoplatonic “law” is echoed almost verbatim by Proclus in proposition 103 of his *Elements of Theology*, although here its range appears to be limited to the triad Being-Life-Intellect – three aspect of the same entity. Proclus asserts that on the level of Being, Life and Intellect exist essentially (ὄντως); on the level of Intellect, Being and Life exist intellectually (νοερώς); and on the level of Life, Being and Intellect exist vitally (ζωτικῶς) (*El. Theol.* prop. 103). Proclus makes use of the principle in other contexts as well, e.g., to explain the Platonic concept of the community and correlation (κοινωνία) of Forms (*In Parm.* 751 ff.), with respect to theurgy in his *De sacrificio et magia*, and with regard to the four material elements (Dodds 1964: 254). In his commentary on the *Timaeus*, Proclus states that the sensible cosmos, since it imitates the intelligible cosmos where all things are in all, also has everything with respect to all its parts, e.g., fire, insofar as it is tangible, participates in earth, whereas earth, insofar as it is visible, participates in fire (*In Tim.* II, 26, 24–29).

Finally, pseudo-Dionysius adopts the Neoplatonic formula in his *De divinis nominibus* (Dodds 1964: 254). However, in the Christian tradition, 1 *Corinthians* 15:28 – where God is said to be all in all (*omnia in omnibus*) – is also of considerable importance, and often merges with the Neoplatonic principle.

Innovative and Original Aspects

In the Renaissance, the principle *omnia in omnibus* is explicitly invoked by Nicolaus Cusanus, Marsilio Ficino, Giovanni Pico della Mirandola, and Giordano Bruno.

In the fifth chapter of the second book of Nicolaus Cusanus' *De docta ignorantia* (1440), a section entirely devoted to the doctrine of *quodlibet in quolibet* ("each thing is in each thing"), the idea that everything is in everything (*omnia in omnibus*) is traced back to Anaxagoras (*De doct. ign.* II, 5). Nonetheless, Cusanus takes a Neoplatonic approach to Anaxagoras' theory (Aquilecchia 1973: 77). In Cusanus' interpretation of the principle, the universe is in each individual thing because each thing is a contraction (*contractio*) of the entire universe (Hopkins 1978: 36). Cusanus gives the example of the concept of humanity. Just as humanity is neither Plato nor Socrates, but in Plato is Plato and in Socrates is Socrates, so is the universe in relation to each individual thing (*De doct. ign.* II, 4). In its own proper way, namely, as a contraction and particularization, each individual thing represents the unity and interconnectedness of all things, i.e., the universe (Miller 2003: 52). Additionally, in chapter 17 of *De venatione sapientiae* (1463) Cusanus appears to allude to the Porphyrean and Proclean version of the principle, although he names Plato as his source (*De ven. sap.* 17). Here, he uses the formula to express the idea that all things exist on all levels of reality, but on each level according to its proper mode of being (*suo modo*): in the intellect, for example, all things exist in accordance with the intellect's mode of being, i.e., in an intellectual way (*intellectualiter*), in a conceptual way (*notionaliter*), or in a knowable way (*cognoscibiliter*). In the seventeenth century, Cusanus' treatment of the principle had a profound influence on Athanasius Kircher (Leinkauf 1993: 84–85).

Marsilio Ficino makes ample use of the Neoplatonic golden rule that "all is in all, but appropriately." In chapter XXIV of his *Compendium in Timaeum* (1496), he first describes how the four elements exist in the Demiurge by way of their ideas, in the World Soul by way of their reasons,

in the heavens by way of their powers, and beneath the heavens by way of their forms (Allen 1987: 419–420 and Hankins 2004: 170). At the end of the chapter, Ficino paraphrases and translates various passages from Proclus' commentary on the *Timaeus* (*In Tim.* II, 26 ff.). He writes, for example, that, just as in the archetypal cosmos all things are in all things (*omnia in omnibus*), so in the sensible world all are in all, but according to the nature of the receiver (*pro natura suscipientium*). This leads him to conclude that in the elements celestial things are elemental, whereas in celestial things the elements are celestial (*Comp. in Tim.* XXIV). And, like Proclus, Ficino refers to the participation of fire in earth and vice versa (cf. *supra*). This section of Ficino's *Compendium* seems to have been the source of Heinrich Cornelius Agrippa's *De occulta philosophia* I.3 (Leinkauf 1993: 89). In chapter 50 of his commentary on the *Timaeus*, Ficino claims that each world sphere is, as it were, the whole cosmos and embraces all things according to its own property (*cuncta sua quadam proprietate complectens*), a statement that is followed by the Plotinian observation that in the archetypal cosmos all Forms are held within each individual Form (*Comp. in Tim.* XL). Ficino, like Proclus, applies the idea of *omnia in omnibus* to the total structure of reality (Leinkauf 2005: 371). It also deserves mentioning that the same formula occurs in Ficino's translation of Proclus' *De sacrificio et magia* – where it functions as a theurgic principle – and in his translation of and commentary on pseudo-Dionysius' *De divinis nominibus* 1.7 – where it is used as a synonym for God (cf. 1 *Corinthians* 15:28).

The 17th thesis of Giovanni Pico della Mirandola's *Conclusiones secundum Proclum* – in his famous *Conclusiones sive theses DCCCC* (1486) – clearly echoes proposition 103 of the *Elements of Theology* in asserting that, although the divine hierarchies are distinct, everything is in everything in its own proper way (*omnia in omnibus esse suo modo*) (Kristeller 1987: 208). The principle reappears in Pico's *Heptaplus* (1489), a commentary on the creation narrative of *Genesis* 1. In the second proem, Pico attributes the origin of the idea to Anaxagoras and says that

it was adopted later on by the Pythagoreans and Platonists. The maxim plays a pivotal role in Pico's theory of the three worlds – the angelic, celestial, and sublunary world (Black 2006: 159–160). According to Pico – again in the second proem of the *Heptaplus* – these three worlds are one, not only because they derive from one principle but also because whatever is in all worlds (*quicquid in omnibus est mundis*), is also held in each of them individually (*id et in singulis continetur*). It is important to note that the principle thus acquires a complementary, allegorical function that is crucial to Pico's interpretation of the Bible: from the perspective of the divine hierarchies, the same word or name yields different meanings and interpretations (Black 2006: 161).

In *De la causa, principio et uno* (1584), Giordano Bruno uses the notion that all is in all as a representation of the unity of the cosmos, which, as a perfect whole consisting of different parts, is both one and many (Beierwaltes 1980: 192–193). In the second dialogue of the work, the principle that everything is in everything (*ogni cosa essere in ogni cosa*) is applied to the soul and ascribed to Anaxagoras. Additionally, in the opening pages of the fifth dialogue, the dictum that everything is in everything in its own proper way (*tutto essere in tutto, ma non totalmente et omnimodamente in ciascuno*) is linked to the universe and is a free translation of the Neoplatonic version of the same principle. Similarly, in his Latin works – e.g., *Sigillus sigillorum* (1583), *Lampas triginta statuarum* (1587), and *De innumerabilibus, immenso et infigurabili* (1591) – Bruno follows Cusanus in combining the Neoplatonic and Anaxagorean interpretation of the principle (Aquilecchia 1973: 77), and the expression *omnia in omnibus* often occurs in the context of the elements (e.g., *De immenso* V.1 and V.9). For Bruno, as for Proclus, “metaphysically and physically everything is in everything” (Whittaker 1918: 277).

Generally, it can be said that in the fifteenth and sixteenth centuries, the Anaxagorean-physical, the Neoplatonic-metaphysical, and the Christian-theological interpretation of *omnia in omnibus* are closely interwoven, to the extent that the different

layers of meaning created by various traditions can no longer be clearly separated. In the universe of Cusanus, Ficino, Pico, and Bruno, literally everything is in everything.

Abstract

Martin Opitz, regarded as the “Father of German Poetry” (Garber 1976), was a pioneer in establishing a national German literature by creating a reform of vernacular poetry and introducing foreign literary models.

Alternate Names

Biography

Opitz, the son of a prosperous butcher in Bunzlau, Silesia, received his early education at the Gymnasium (grammar school) of his native town. In 1617 he attended the “Schonaichianum” at Beuthen. During his studies at Frankfurt an der Oder (1618/1619), he published his first important essay *Aristarchus; Sive, de Contemptu Linguae Teutonicae*, a patriotic apologia of the vernacular (Robert 2007). This essay can be regarded as the nucleus of his subsequent poetological reform. In 1619, Opitz went to Heidelberg, the center of German Calvinism, where he attended university (Garber 1976, Robert 2013). He became a member of a circle of poets trying to develop a new German humanistic poetry was meant to be coequal with other European literature. After the Battle of White Mountain (1620), Heidelberg was conquered by Emperor Ferdinand's troops. Opitz had to go into exile and moved to Leiden in the Netherlands where he met the Dutch “national poet” Heinsius. In 1622 he followed the invitation of Gabriel Bethlen, the Duke of Transylvania, who needed

scholars for his newly founded gymnasium. After a wandering life in the service of various nobles, he was appointed councillor to the Duke Georg Rudolf of Liegnitz and Brieg in 1624. Two years later he became secretary to the Catholic Duke Hannibal von Dohna and soon was in charge of diplomatic missions. In 1627 he was crowned *poeta laureatus* by Emperor Ferdinand II in Vienna and later was ennobled (“von Boberfeld”). The most important German literary society, the “Fruchtbringende Gesellschaft,” appointed him member in 1629. During a diplomatic mission to Paris in 1630, he met Hugo Grotius. Finally, Opitz became historiographer and secretary to King Władysław IV of Poland and settled in Danzig in 1636. In 1639 he died of the plague.

Heritage and Rupture of Tradition

Opitz’s theoretical main work, the *Buch von der Deutschen Poeterey* (The Book of German Poetics, 1624), is a milestone concerning standardizing and establishing the German vernacular (Becker-Cantarino 1982). It is deeply inspired by Renaissance humanism (J. C. Scaliger, Heinsius, Ronsard). This treatise as well as Opitz’s poetical oeuvre modernized German poetry, successfully bringing the literary Renaissance, which Romanic countries and the Netherlands had already experienced, to the German literary scene. By presenting translations and adaptations, not only the ancient *genera* become vernacularized (*Trost-Gedichte*, *Vesuvius*, *Lob des Feldlebens*) but also modern forms like the sonnet (i.e., *imitationes* of Petrarca, Vittoria Gambara, Rosard), the odes (i.e., *imitationes* of Heinsius), as well as opera and romance. In addition to this, he left behind a comprehensive neo-Latin oeuvre (Marschall and Seidel 2009–2011).

Innovative and Original Aspects

The “heart” of Opitz’s program is a prosodic and metrical reform: German verse was to consist of alternating stressed and unstressed syllables

unlike Romanic and Latin metrical principles. By this natural speech, rhythm and metrical declamation were meant to coincide. The innovative aspect of his own extensive work is that Opitz wrote in accordance with his newly established poetical principles and offered a wide range of exemplary German poetry by imitating foreign, especially contemporary, literature (Borgstedt 2002). In 1625, he published the epoch-making *Acht Bücher deutscher Poematum*. Further important works are the opera *Dafne* (1627; music by Heinrich Schütz), a pastoral novel (*Schäfferey von der Nymfen Hercinie*, 1630), the irenic poem *Trost-Gedichte in widerwertigkeit des Krieges* (1633), the didactic poem *Vesuvius* (1633) which combines ancient form traditions with aspects of natural science, the multilingual experiment *Florilegium variorum epigrammatum* (1639), the translation of drama by Seneca (*Die Trojannerinnen*, 1625) and Sophocles (*Antigone*, 1636) and of the *Song of Songs* (1627), and the *Huguenot Psalter* (1637).

Impact and Legacy

Opitz’s immediate impact on the evolution of German literature was indeed deep and far-reaching. His reform consisting of poetological essays as well as ambitious exemplary poetry is acknowledged as the seed for the blossoming of seventeenth-century German poetry. His contemporaries already regarded Opitz as the greatest German poet of the time and his reform as a new beginning. Nearly all important poets of the next generation, like Paul Fleming or Andreas Gryphius, felt encouraged by Opitz. As a result, the reevaluation of the German vernacular as a literary language was established during the seventeenth century.

Abstract

Optics, the mathematical science of vision, went through revolutionary changes in the sixteenth and early seventeenth centuries. These were driven by multiple factors, such as: the discovery of texts and new mathematical techniques; the development and investigation of new optical technologies; advances in the anatomy of the eye; and participation in the incipient culture of experimentation. This period also saw the resolution of a problem that had been a puzzle since antiquity: the mathematical law governing the refraction of light. The end result was transformation of optics from the geometrical study of the subjective phenomena of vision, to a mathematical science of the objective behavior of light, which could be assimilated into the new

mathematical physics of the seventeenth century. Philosophically, the human observer was no longer an active participant in vision but the passive recipient of physical stimuli from the outside world.

Heritage and Rupture with the Tradition

Optics was the mathematical science of vision (and, secondarily, of light). The earliest extant works on optics were written by Euclid: *Optics*, concerning direct vision, which is extant in two slightly different versions; and *Catoptrics*, concerning reflected vision in mirrors, flat and curved. Some four centuries later, the great astronomer Ptolemy wrote a much more ambitious *Optics*. While Euclid's works consisted of tersely stated propositions and demonstrations, Ptolemy wrote much more expansively about the nature of direct and indirect vision, while also formally setting out propositions. He covered direct vision, reflection, and even refraction in a single work, and, perhaps most importantly, described in detail the construction and use of experimental optical apparatuses. He recorded the results of his own experiments in measuring refraction between air, water, and glass, and inserted into the work a table of refractive angles, at 10° increments of angle of incidence, which were both quite accurate, and would have a significant influence on later optics (Smith 1999).
